How Many Hens May be Kept on an Acre?

Practical Poultry People's Plans Written for Cultivator Readers Have Valuable Suggestions

SOME weeks ago we received request from subscriber at Acampo in which he asked that our best poultry keepers give plan for keeping largest number of poultry on a certain number of acres planted in orchard with alfalfa between trees, number and size of houses and pens required; also as to whether the whole plot should be fenced and chickens allowed to run at large. This request was sent to a number of poultrymen who give their experience along this line.

J. L. Harrison, Lake Avenue Poultry Yards, Pasadena.

How many hens will one acre accommodate? This depends on the character of the soil and the energy of the owner. I have nearly eight hundred, young and old, on a strip 130 by 250 feet,—all are in perfect health and doing as well as any chickens I ever saw. The soil is loose gravel, well drained, and there are enough blue gum trees on the tract to extend a network of roots under it, thereby feeding out any impurities which might occur from improper cleaning of the yards in the rainy season. My preference is for not over twenty-five fowls to a yard and I am satisfied that about fifty is the limit number that can be profitably housed and yarded together. I keep Rhode Island Reds exclusively, though in former years I have successfully kept Leghorns, Minorcas and Rocks in these yards.

These questions of dimensions of houses and open or closed front have been most thoroughly threshed out at the monthly meetings of the Poultry Association and there is a wide variation of opinion as to the best method of housing. After hearing the testimony of many of our most successful breeders, one is lead to believe that any sort of housing will fill the bill and one's business instinct would guard against any undue extravagance in the matter of building,—if the experience of these poultrymen is to be accepted. I have seen houses costing from 15 cents to one dollar per hen, and they all seemed to do the business. My houses are five feet wide by sixteen feet long with a partition through the middle. If I were building a new plant I would make the houses eight feet wide and use "Rubberoid" instead of boards. I regard open front houses as a dangerous experiment in a climate like this, with an average of thirty degrees variation in temperature between day and night. My experience has demonstrated to my own satisfaction that a fowl properly protected from the chill night air lays better than the one roosting in a tree or in an open shed.

Herman Zander, Sunny Slope Poultry Ranch, Santa Paula.

One acre will accommodate from 600 to 800 hens according to the variety: Mediterraneans up to 800, American breeds 600. The number kept in one pen should be determined by the size of pen. I have found that pens of 35 by 75, or the equivalent, will easily keep 75 of the American breed or 100 of the Mediterranean. I keep Rhode Island Reds, White Wyandottes, and Anconas, and figures given will apply to both American and Mediterranean breeds.

As to dimensions I find houses 6 by 6 most satisfactory, as they are more easily kept in first class condition, both as to cleanliness and amount of labor. I find open front houses without floors most satisfactory in every way. My houses are built as follows: I use 2 by 6 to make runners, as if building a sled. On this I build a light frame of 1 by 3, which is placed 3½ feet high in front and 2½ feet in back. Cover this with wire netting and stretch over this half-ply roofing paper. The wire netting is put on to hold the roofing paper taut, being just as satisfactory as boards, but very much lighter, the roofing paper being vermin proof. I make my houses light, as I have them all moved on to fresh ground weekly, guaranteeing sweet fresh ground underneath the roosts, and at the same time very much facilitating the cleaning up of the droppings. Front and bottom being open, secures plenty of fresh air for the hens, the back coming only within 6 inches of the ground. I also front the houses toward the south in this part of the country, thus keeping off the heavy winds. For the rainy season I have a frame covered with wire netting and roofing paper, same as the house, which is hinged to top of house and reaches down even with the roosts, which are 18 inches from the ground. During the summer and at all times in clear weather these frames are raised up forming an awning, thus giving additional shade during hot part of day.

A. G. Goodacre, Compton.

You can comfortably keep 500 hens on an acre; as many as 80 to 100 Rhode Island Reds in one flock and from 80 to 200 Leghorns to the flock. We use open fronts decidedly, and prefer a shed roof with a three to four-foot projection in front, thus really making a double pitch roof, with back at least four feet. Perches are spaced 14 inches apart. The length and width of building we designed to meet requirements of flock, building of any cheap material, possibly $12.00 per 1000 shakes, or paper, or one-half inch redwood, costing from 20 cents to 25 cents per hen.

We breed Orpingtons, Reds, Leghorns and Anconas. We keep our Orpingtons in small flocks and keep them busy. Six inches of perch room is allowed for Reds and Leghorns and always some spare room besides.

Mrs. M. E. Sherman, Minnewawa Ranch, Fresno.

We have never specialized as chicken raisers but have always tried to keep enough to furnish eggs and food for the table. We either raise them in the incubator, by hens, or by buying the newly hatched chicks. The difference in plans is not premeditated, but grows out of the fact that we are busy people and if we happen to have someone that can be trusted to run the incubator and after attend to the chickens in the brooders, we use this way; if we have not the proper person then the hens are allowed to mother their broods. We find that four hundred little chickens give us about enough each season to have on the table four or five times a week and to keep up the supply of young hens as layers.

The yards are five in number. Four of them measure 85 feet by 55 each, while the large yard, or fifth one, is 110 by 110 feet. Each yard has a house and is piped with running water. The large yard contains in addition to the regular house, a good sized brooder house with a feed storage room and on the second floor is placed a pigeonry. The brooder room on the first floor has four fireless brooders in it and a good oil stove to furnish heat. The whole side is of glass to let in sunshine. Each brooder has an indoor yard and an outdoor yard fenced and covered with wire.

With the exception of the larger brooder house the other houses are merely lean-to's with entire front open to the south. These are built as cheaply as possible and average about twelve feet by ten and are five feet at the eaves and eight to ten in the front. A simple eucalyptus pole swung by wire makes a good roost and a mounting board laid along the back gives entrance to the laying boxes. These are arranged loosely on a shelf fastened against the outside of the rear of the house. Holes cut through from the inside admit the hens. In front of these houses planking to make a rough support for a roof of palm leaves is put up and makes a summer lounging place for the hens in the shade. The floor of these simple houses is the natural earth. We build them in this cheap way so that if they become too full of vermin to be controlled readily by the spraying, we can remove and build on the other side of the lot new houses.

This entire chicken yard is in alfalfa and requires to be cut two or three times each season before the chickens gain control of it. There are eighteen quince and Japanese persimmon trees growing in yard that afford a shade to the hens.

We consider that 20 hens do better in yards of this size than a larger number. As to the breed of chickens. We have now the Barred Rocks and they seem to be the best for us all around. We had at first, twenty-five years ago, Black Spanish, then Langshans, then White Leghorns, then Gray Brahma, then Brown Leghorns, and now Barred Rocks for the past five years. The Leghorns, of course, lay more eggs, but are very troublesome on a fruit ranch as they are hard to confine to the yards and make their way into everything. Disposal of them was brought about by their persistent raiding of the olives in the fruit boxes. Some years like this one, when we have an undue number of roosters in the young chickens and have to sell eight or ten dozen, we find greater profit in yellow-legged white pin-feathered chickens.

O. M. Robbins, Santa Ana.

One acre can be made to accommodate 2500 hens if all feed is raised from other land. A yard 10x20 will accommodate 10 to 12 hens and a cock nicely, which is about the correct number for one pen to get the best results. I believe in small flocks and small pens where one has not much room. I handle Buff Leghorns and have always been practically free from disease with my adults. Growing chicks sometimes get lice when I am too busy at office to properly attend to them. Once in a while I lose a chick from white diarrhoea, but it is always when I have been busy. I think that the heavier breeds should have about 25 to 50 per cent more room than the Leghorns.

As to houses, my preference is a tight board fence running east and west, then a slant roof about 6 feet wide fronting the north to protect from rain—no house at all. The roof covers the scratching pen, and the roosts are over the straw with boards beneath the roosts for droppings. If birds are kept from drafts and rain no more protection is necessary.

I have one portable house 5 feet wide, 7 feet deep, with two stories 3

Citrus and Sub-Tropical Fruits

THE OLIVE TREE.

THERE are as many as eighteen kinds of this tree and its fruits. The distinction lies mostly between the wild and the cultivated, the former of which is dwarfish, useless and unproductive, while the latter is valuable, both for its fruit and the beauty of the tree. The difference has been compared to that between the crab and the choice apple, or the sloe and the plum.

The tree is an evergreen, and runs up to a height of 20 or 30 feet; its trunk is knotty, its bark smooth and of an ash color, its leaves oblong and resemble the willow, dark green above and whitish underneath. It blooms in June, the bloom is in bunches, small white and beautiful. The fruit is oval in form, first green, then pale and ultimately black. It will grow on the driest and most flinty soil and lives to a great age.

It abounds in the eastern countries and likely had its origin in Asia, thence transplanted into Southern Europe. It does not grow spontaneously in Europe as in Asia. It is abundant in Syria and Palestine. In the valleys and on the mountains of the Holy Land it grows with its ancient freshness and may there be seen growing as it grew eleven centuries before the Christian era.

During the siege of Jerusalem by Titus, the trees were all cut down, but from the roots a new growth sprang up. It grows well on the shores of the Mediterranean, and flourishes in Greece.

It will grow in Great Britain if protected from frost. In Egypt its cultivation has failed to a great extent owing to the indolent habits of the people. The present interests are looking to a more general growth there.

It may be popagated by layering, grafting or budding. Its growth is confined to warm climates. The olive at one time in Palestine was considered an emblem of prosperity and by numerous tribes, as sacred. Among the Greeks to this day the olive branch with its fruits is used to adorn their apartments at nuptial feasts.

Among the ancients it was considered an emblem of peace and reconciliation and was among others sacred to Appollo.

The olive was one of the principal fruits cultivated by the Jews, who used it for their daily food, it being highly valued for its nutritive qualities. The leading and most valuable product was the oil made from its fruit. This oil is very useful in many ways. The Greeks, with many others, use it in cooking, using it in almost every dish. The Jews used it only as a food, but under the ceremonial law it was an ingredient in a costly perfume wherewith the sacred orders o the priesthood were annointed. There is no doubt but that it was this ointment that the woman poured upon the head of Jesus. This oil has long been used in mitigating pain, and to cure poisonous bites of vipers, and has long been used with great success in constitutional treatment.

It is not known as well as it should be, that the proper use of this oil is a constitutional cure for consumption in its incipient stages, and may be used with great benefit in all lung trouble, even in the last stages. Great care should be taken that the oil is pure. In order to have pure oil, great care must be taken in the making.

In order to make it pure, the fruit must be at its best matured stage, carefully gathered, that is, picked from the trees unbruised. The oil should be expressed immediately after gathering, and put into air tight sealed bottles.

The following prescription for lung trouble will prove of great merit to those who carefully use it:

One-third part pure olive oil, two thirds part pure grape juice, unfermented wine. Mix well together, shaking just before using. Take one tablespoonful one-half hour before meals and one dose just before going to bed. Eat three regular meals each day. Eat nothing between meals. Eat good, easily digested food. Do not overload the stomach. Take plenty of out-door exercise, sleep in a well ventilated room, but not in a draft of air from a window or otherwise, and practice full breathing morning, noon and night.

By following this prescription strictly and long enough most cases of consumption in first stages will be cured and much relief and length of life in the last stages.—Southern Fruit Grower.

SOUR CLOVER.

In some sections of California, especially along irrigation ditches, both the sweet and sour clovers are a perplexing pest. The growth is usually very rank and troublesome to remove. To make use of some of these pests should be our aim, and some have found that the sour clover, Melilotus indica, has great value as a green manure crop. It has the faculty of sending its roots very deep into the soil and gives a great bulk of green stuff for turning under. If it is sown early so as to get thoroughly rooted before cool weather a very strong growth will be made before plowing under time. It should be sown broadcast at the rate of about 15 pounds per acre. Early in October is a good time to sow, though it is sown as late as November. Of course, where sown early, it must be irrigated. Regarding the seeding of this crop we quote from circular of the Arizona Experiment Station:

"The method of seeding found to be the best is to level the ground well, sow broadcast, furrow with a three-shovel furrower, roll and irrigate by running the water in the furrows which should be two or three feet apart. Irrigating it during the winter will not only increase the yield but benefit the orchard. It should be plowed under when about to blossom. At this stage the yield proved to be 15 to 18 tons of green matter. If permitted to grow longer it becomes more woody and does not turn under so well or decay so rapidly."

The Lankershim Ranch in Los Angeles county, is now harvesting its last big crop of grain. In one field it had 47,000 acres which acreage will now be cut up into smaller ranches.

Tobacco growers at Yorba, Orange county, now have growing over 80 acres which is said to be the largest acreage of tobacco in the state.

CALIFORNIA RED AND YELLOW SCALES.

By A. W. Morrill, Entomologist, Arizona Horticultural Commission.

These two insects are established nearer to Arizona than any other of the important citrus pests. They are comparatively small in size and being closely related are distinguished principally by their differences in color. Their feeding habits are distinctly different. On citrus the red scale infests bark, fruit and leaves, while the yellow scale infests only the fruit and leaves. The former, in addition to citrus, infests many fruits and ornamental plants such as rose, apple, peach and other rosaceous plants, fig, olive, various palms, oak willow and Euonymus. The latter species has been recorded as infesting only fig, Euonymus and Aucuba in addition to citrus. There is no egg stage in either species, the young being born alive.

In general the red scale is considered the most destructive of the two, although the yellow scale exceeds in destructiveness in some localities. Both scales are considered as unusually well adapted to thrive in hot, dry climates.

Concerning the red scale, Mr. Cundiff, horticultural commissioner of Riverside county, said in an address before the Claremont Pomological club: "The red scale is essentially a hot weather insect and revels in a dry, arid, climate. The unusually warm summers following the mild winters that have prevailed during the past few years have caused an unprecedented spread of the insect and has made the control of it in some localities very troublesome and expensive." Concerning the red scale in Mexico, Dr. Coit reports as follows (Bulletin 58, Arizona Agricultural Experiment Station): "The writer found many orange groves about Guaymas, Sonora, practically ruined by this scale. Also at Hermosillo, where the conditions are very much like our own, the citizens have been compelled to cut down and burn all the orange trees on the Capitol grounds as well as many about town in order to bring the pest under control and prevent its spreading into large commercial orchards nearby.

The California red scale was reported several years ago as occuring in Florida, but in a period of over three years spent in citrus insect investigations the writer has never observed it in that state.

The yellow scale in Southern California is most injurious in the highlands and dryer sections, notably in the foothill region of the Sierra Madre range, and is reported as prevalent in the hot interior valleys of northern California.

The red and yellow scales are best controlled by fumigation. In their control in San Bernardino county, California, it is reported that about $35,000 worth of chemicals were used by the county fumigating outfits between July 15, 1908, and February 15, 1909. This does not include the cost of chemicals used by private outfits, which are numerous.

The yellow scale is partially controlled in some sections of California by a minute parasite introduced from Japan, but natural enemies are considered of no practiacl value in the control of the red scale.

Kerman, Fresno county, boasts of millet six feet high.

All Fruit Growers, Attention

The Bolton Orchard Heater

has been unanimously adopted and indorsed by the

California Fruit Growers Exchange and Supply Company

◆

Our capacity for the manufacture of the heaters is limited this season and the growers who want protection from frost must place their orders immediately or we will not guarantee delivery.

◆

All arrangements for the fuel oil are now being made by the Fruit Growers Supply Co. and all those using our heaters will be given sufficient oil and at a very low cost. All members of the Fruit Growers Supply Company can send their orders in to the Supply Company. All independent growers who want our Orchard Heater can communicate with our local agents.

◆

All orders for Heaters must be given 60 days before Dec. 1, 1910, or delivery cannot be guaranteed. All information regarding our Heaters and Thermometers can be had by writing us, or at our local office.

Deciduous Fruit Culture

THE APPLE IN SOUTHERN CALIFORNIA.

By Frederick Maskew, Sacramento.

WITH a very few exceptions, the older apple orchards of Los Angeles county, ranging in extent from 1 to 10 acres are merely an incident to the general business of agriculture, and as such have passed through all the vicissitudes common to such an arrangement. A careful study of these orchards shows clearly that the conditions found there are by no means due to fundamental causes such as soil, moisture, or climate, they are simply the logical accompaniments of lack of knowledge of suitable varieties and poor methods of management. Especially is this so in the selection of varieties.

One of the most prominent features in these orchards that have been under consideration in this paper was their tendency to produce large crops of fruit. In many of them there were almost as many different varieties as there were individual trees. Still the full bearing habit was universal. Out of this infinity of varieties came two that were paramount to all others, the White Winter Pearmain and the Yellow Bellefleur. These, in common with the others produced good full crops of fruit and the fruit possessed a good market value. Close observers soon commenced to realize that these varieties could be grown at a profit and with a view to enhancing these profits commenced to plant out orchards composed entirely of one or the other of these two varieties, especially was this so of the White Winter Pearmain.

Thus commenced what may be considered the second period of apple orcharding in that region.

The young trees in these orchards grew with all the customary vigor of the White Winter Pearmain, but they failed to set a crop of fruit. Season after season, when the Pearmain trees in the older orchards of mixed varieties were breaking down under their load of fruit, the younger orchards set in solid blocks of one variety were not producing a box to the tree.

I have in mind a number of these orchards and their owners with both of which I was intimately acquainted at that time. Without taking up your time in going into details, I will state that these conditions brought those who were vitally interested in this matter face to face with the question of cross-pollination and its bearing upon the production of fruit in commercial apple orchards.

The many influences that enter into the normal failure of the fruit blossoms to set, such as heavy wood growth in the young trees, the attack of insects and fungi on the blossoms, frost, rain and other unfavorable weather during blossom season were all given careful consideration, during the investigation that was made of this problem by a number of the leading apple growers of that section. Many arguments, some of them very ingenious, were made pro and con as to the value or even the desirability of cross-pollination. It was, however, clearly recognized that self-sterility is not a constant character with any variety. The same variety may self-sterile in one place and nea self-fertile in another. The adap tion of a variety to soil and clima has much to do with its self-fertili It would be fallacious to attempt separate apple trees into two defin classes, the self-fertile and the se sterile. All this goes to show th the problem is as much a study conditions as of varieties, and we can never be perfectly sure th any variety will be self-fertile in new region. Planting for cross-p lination purposes as a matter of surance in fruit-production is now coming a general orchard practice

The practical bearing of the pro lem is this. There are certain rieties of apples that due to the profitableness we wish to grow la ly for the general market, but we fi that they cannot be depended upon produce full crops when plante alone. They need the pollen of othe varieties to make them fruitful. The we must plant other varieties nea them as pollenizers.

Having determined upon the v riety to be grown for a general cro the most important point in the sele tion of the pollenizer is that the tw shall blossom at the same time. Th only way in which a pollenizer ca be of service in promoting fruitfu ness in the variety planted for th general crop is by supplying it wi pollen. This means that the pisti of one variety must be ready to r ceive the pollen when the stamen of the other are ripe; this is on possible when both varieties bloo simultaneously.

The comparative blooming of v rieties is something of a local pro lem Difference of location, altitud soil and weather, govern the time appearance of the blossoms, bu series of observations made by th writer, tend to show that while th date of blossoming may be hastene or retarded by local conditions, th comparative time is approximatel the same for different varieties i localities having similar conditions o soil and climate.

The variety to be used as a polle izer is, of course, governed by variety to be planted for the ma crop. This question having been de cided, the next question is to kno how many trees will be necessary pollinate the self-sterile variety. Th brings us back in so far as my knowl edge extends, to the apple orchards of Los Angeles county.

Out of the failures, disappointments and difficulties of the two periods o apple growing just described came the apple orchards of today. A study of these will show that the owners are beginning to pay more attention to some of the finer problems of ap ple culture, such as the relation o varieties to pollination, their suscep tibility to disease, the individuality of trees, a better class of nursery stock and the question of selecting the buds and cions for propagating purposes. In these young apple or chards, can be seen on every han the principles of selection, plantin and pruning advocated by Wickson Powell and others, applied all uncon sciously perhaps of their origin b the workers, but in evidence, never theless to the close observer.

Such an orchard is the one owne

by Mr. Cudahy at Florence. Here there are 30,000 apple trees in one block. To insure fruitfulness in this orchard, one row of pollenizers was planted to each eight rows of the varieties considered best adapted to the location and market demands. The pollenizers were planted in straight rows to facilitate harvesting. Fall Pippin was used principally as a pollenizer for the White Winter Pearmain and in some instances Yellow Newtown Pippin for the Yellow Bellefleurs. I was in this orchard about 14 months ago and from my own observation, as also the statements of the Superintendent, this arrangement had proved satisfactory from the standpoint of the production of fruit.

In the effort made by the apple growers of the region to take advantage of all the lessons learned from the two preceding periods of the industry, great attention was paid to the question of the quality of nursery stock. A bud on a whole root was considered the standard of excellence, and it was soon learned that a more uniform stand of symmetrical trees could be obtained by planting those with a straight whip-like top of one year's growth, than from those that had been grown the second year in nursery rows. The conditions that resulted in this decision were found to be as follows: In well grown one year old wood every eye or bud is strong and perfect and can be depended upon to grow when the young tree is cut back to the desired height, thus insuring a sufficient number of shoots from which to select those that are to form the new and permanent head of the tree. In two years on older wood these buds have performed their proper functions in the production of either shoots or leaves and cannot be depended upon to put out uniformly. It was found that trees grown the second year in nursery rows, had invariably been branched too high to meet the accepted standard of height in that locality, and when these were cut back below the point at which they had been branched, they would almost invariably put out from a bud just above the ground.

In following up this matter of nursery stock further it was found that there were still other factors to be considered.

In almost every apple orchard, even in those in which the general growth had been satisfactory and fairly uniform, there was found to be a distinct individuality in the trees of the same variety, regular bearers, erratic bearers, shy bearers. The foliage differed too. I have seen a Yellow Bellefleur, one out of fifty, carrying rich, green leaves throughout the season, when the foliage of the remainder was brown and withered from the attack of mildew, and this not only for one season, but for several consecutive seasons.

It was claimed at the time that these conditions were the logical results of the indiscriminate cutting of buds for propagating purposes, especially so of cutting buds and scions from nursery stock from young trees that had not had an opportunity to develop any characteristics whatever, either good, bad or indifferent.

If the laws of heredity hold good in the vegetable kingdom, and the history of horticulture will justify us in concluding that they do, the character of resistance of foliage and habits of hearing can be transmitted through the buds. It is well at this point to make the distinction between a type and a character. No amount of care in selection will transmit a type. A type is the result of environment, character the result of heredity.

In the effort to transmit desirable characteristics through propagating wood it is well to remember that the individuality of an apple tree cannot be determined by the observations of a single season. It must show persistent good behavior for several seasons and must be accurately watched and compared with other similar trees before we can obtain a correct estimate of its habits. Many causes tend to produce heavy bearing, high color or large size, for a season or two, but when a tree under average orchard conditions shows that its habits of bearing and health or foliage are stable, then there can be little question about the transmission of its characteristics through its buds, and the annual crop of buds from such a tree should be worth more money for propagating purposes than the market value of its fruit.

In the consummation of this ideal of having the good habits of the apple trees universal throughout the orchard the initial step must be taken by the planter. He must create the demand for pedigreed stock and must be prepared to pay accordingly. A propagator of apple trees can cut 1,000 buds in the nursery rows in less time than he can ten from an individual tree. In all lines of business, time costs money, but the cost of nursery stock, if the quality is there, should be the least of factors that enter into a long-time investment like an apple orchard.

And now, for the especial benefit of those who propose to extend the apple industry into new regions, the lessons drawn from a prolonged study of the apple orchards of Los Angeles county, concerning the laying of the foundation of a commercial apple orchard may be recapitulated as follows:

Study well the local conditions before selecting the permanent varieties.

Insure fruitfulness in large blocks of one variety of apple trees, by planting pollenizers among them.

Look into the origin of the propagating wood used before buying nursery stock.

There is nothing in all of what has just been said that is new. No one knows that better than I do. In apple orcharding, as in every other phase of horticulture, the state of knowledge is far, far in advance of the state of practice. These truths have been set forth time and time again by such masters of the science as Waite, Wickson, Powell, Fletcher and others. All the good that I could hope to come from this paper lies in the fact that the report of this convention will be widely circulated and some future planter of a commercial apple orchards may perhaps have his memory refreshed upon these points before he plants his orchard rather than after the loss of many years and much money.

FEDERAL INSECTICIDE AND FUNGICIDE LAW.

Under an act signed by President Taft April 26, the manufacture, sale, or transportation in interstate commerce, in the District of Columbia, or the Territories, of adulterated or misbranded Paris green, lead arsenate, and other insecticides and fungicides is prohibited after January 1, 1911, at which time the act goes into effect.

The law corresponds in a general way to the federal food and drugs act of 1906. Rules and regulations for its enforcement are to be formulated by the Secretary of the Treasury, the Secretary of Agriculture, and the Secretary of Commerce and Labor, but definitions and standards are adopted for most of the principal products dealt with. Violations of the law constitute a misdemeanor, and are punishable by a fine or imprisonment or both. The analytical work is to be under the direction and supervision of the Bureau of Chemistry of the Department of Agriculture.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE SIRE.

THE head of the dairy herd is more important than the cows——if the herd is to be built up from the heifers raised on the farm. The heifers are half the blood of the sire mathematically, usually they are much more like the sire's family in performance. In the pure bred herd the sire's blood is a strengthening against the individual irregularites that have appeared in the cows. The sire tends to make the herd more alike in vigor, in feeding qualities, and in general handling. A herd that is alike in these respects means more than one thinks at first. After buying cows, a few here and a few there, and placing them together has been tried, one comes to know how much better it is to have cows of like temperament to feed and milk.

Cost.

The first cost of a registered sire often looks heavy to those that do not understand the reason why others are willing to pay for them. Add five hundred or a thousand dollars to the increased milk or butter yield of a herd every year from the use of an improved animal and he pays for himself over and over each year. A herd producing three hundred and fifty pounds of butter per cow each year is considered profitable and yet this yield can be raised fifty or even a hundred pounds by the use of a sire having that capacity inherited from his ancestors. There is a difference in the prepotency of sires that is not easily accounted for by any known rule. Some times one son of a cow will be a great herd bull while all the rest are only passable. There is one feature that is not often considered, that is that the bull of good blood and that is in himself a good individual does not pull down the herd. They may not gain rapidly but they fail to go back. The securing of the animal that does improve a herd rapidly is one of the fortunes of war.

Testing.

Until a sire has enough daughters to test for butter fat one may not be sure of his value but in a degree he may be tested very young. When nine months old use him on a few selected heifers, say four or five and then let the matter rest. When these heifers calve, if the offspring is as good, as individuals, as the parents, one may rest assured that it is safe, when the sire is two years old to use him for a few more. Then if he still shows quality in the calves he should be retained until some few can be tested for butter fat. If the youngsters he produces lack quality, do not keep him no matter what he cost, or what his breeding may be. It is always well to cut off cost as early as possible for it is very easy to run into debt for a herd of cows. High cost of feed and labor soon eats up profits. The casting away of the money in a herd bull is little compared to the loss of retaining him. It is a case where foresight is better company than hindsight.

Grade Herd.

The sire of a grade herd should always be a pure bred animal for there is mixing up enough in blood in a grade cow. Mixed blood stands for mixed inheritance and mixed inheritance stands for mixed transmission. Lack of breeding makes mongrels and degeneration of the good qualities. This is noticeable in dogs; while some curs are bright and clever, one has only to see the dogs in Egypt and in India to realize what the word cur means as a term of contempt. The pure bred sire when placed at the head of a grade herd has all the inheritance in one direction and if he transmits fifty per cent of that to the calves they have a stronger boost toward goodness than to any one other thing. This is what is meant when it is truthfully said that the sire is more than half the herd.

Mistakes.

There are some foolish mistakes made in the matter of buying pure bred bulls to head grade herds. Milk making in a cow mean balance of health and functions and brains. Brains means more in animals than we think for the intelligent animal is trusting and not peevish. The mixed breed cow is not as strong a cow as one bred for special purposes, and this stamina cannot be made but must be bred into the constitution. Therefore when a man with a grade herd, buys a sire that has been bred up to the top notch of performance in his ancestory, he is not wise. The first cost is too great and the cross too violent. The calves in many instances will not have the vigor and constitution to carry the strain of production. The matter of special purpose and function in these animals can be understood at a glance if we consider something else beside the cow. A fine sixteen hundred farm mare is bred to say Dan Patch. Now the result might be a speedy colt once in ten thousand times, but what a wasteful way to do. Breed like to secure like. Now if the dairy herd produced two hundred and fifty pounds per cow of butter last year, then a sire that will transmit a quality of three hundred to three hundred and fifty pounds is a great advance. This quality sire may be purchased readily for one hundred to two hundred

dollars when two years old and is the proper head for the grade herd. When a sire is chosen, one that can make cows better is needed—one that can build them physically in the right direction. Choose, therefore, an animal of good quality and one that carries his breed marks. Choose him carefully and begin to slope the herd up into better production. The ascent should be gradual and not violent in any one generation. The first sire having a capacity from his ancestry of three hundred and fifty pounds a year, the first cross of heifers should give ha that will go into the three hundred pound list. Cull out the poorer ones and also the poorer ones of the mature herd and make the standard three hundred pounds. It will tal about five years to do this if everything proves successful. While a man is grading up a herd it is rather a good idea for him to buy from time to time a registered heifer calf of the same breed as his bull. The increase comes rapidly and a few registered bull calves soon pay for the heifers. Whether pure bred herds pay better than grade stock will always be a mooted question. Yet, with the American love of having the best and being on the top of the ladder there will always be those that will have nothing else.—M. E. Sherman.

SCIENCE AND COMMON SENSE.

The men who handle cows, are rarely scientific in their knowledge or judgment in regard to the animal or the conditions that surround her. Yet, if they are reasoning, observing men, they have a chance to learn a great deal. We hear a great deal among such men about "common sense;" which, if you understand it, means the sense they have. What is common sense? We spent a week once, in hard study to define it and yet it is a thing that is on the tongues of men continually. The best definition we could work out was the following:

"Common sense is the widest understanding possible, of the relation of common things and our relation thereto."

The things to be judged are the facts. In order to exercise common sense about common things we must know as widely as possible all the facts which affect these common things. Do we know them? If not, can we exercise this needful judgment called common sense.

What is science? Nothing but judgment based upon a knowledge of the facts. Does the scientist know all the facts? If so, he is the more completely a scientist. Wherein then does science differ from common sense? Nowhere, providing a knowledge of the facts and laws which govern their action is had. Some scientists excel others in strength and accuracy of judgment; they understand better the meaning and action of the facts they know. It is just the same with common sense. The same knowledge does better with one man than with another. This difference lies in the power and force of judgment.

Now the man of true common sense will never be heard sneering at science. His judgment tells him that scientists have had the opportunity to look farther into all the facts. He respects knowledge wherever he finds it. He knows that though the cow, for instance, is a common thing, yet she is surrounded by a vast number of facts that cannot be looked into and studied except in the light of science. Take the action of bacteria in milk; in the food of the cow; in the diseases which affect her which are nearly all of bacterial origin; in her surroundings. These organisms, so minute that they cannot be seen or studied except by the aid of the microscope, cause wonderful changes in all life. Indeed they change life to death. How shall common sense, unless aided by science, understand them and provide against their destructive action?

The farmer must cease sneering at science. Indeed no really intelligent farmer does that. He must see that scientific knowledge is simply his knowledge carried farther. Of course mistakes will be made, yet the scientist makes less than the common man because of his greater training in careful weighing of the facts. Science has done wonderful things for the dairy farmer and agriculture in general.—Hoard's Dairyman.

COLOSTRUMS OR BEASTINGS.

An Illinois correspondent asks us why a cow's milk is not fit for use until the ninth milking, if that is the case. He also wishes any other information on the subject that we can give him.

The beastings, or colostrum, which is the scientific name for the liquid secreted by the milk glands both before and immediately after calving, possesses peculiar chemical and physical properties, but after the lapse of three days from calving assumes the properties of ordinary milk. It is a food specifically prepared to meet the wants of the young, not merely of the bovine tribe, but of every class of mammalia or animals giving milk.

During the first hours after calving it is very rich in solids and contains large quantities of nitrogenous bodies, of which about one-half are in a state of suspension. It has only a trace of milk sugar, but in its place small quantities of other kinds of sugar. It has about the same amount of fat as ordinary milk, has rather more mineral matter, is of a yellowish or brownish color, has a peculiar smell and a slightly salty taste.

It is the most convenient and the only kind of nourishment for the young calf, and it should on no account be deprived of it. It exercises an especial action on the intestinal canal, has a high nutritive value and is not suited for the dairy. In fact, it is a powerful aperient and tonic. Without the first milk, the calf never does so well. The calf should have the first milk of its own mother, which is specially prepared for it. It is nature's prepared food for the individual calf and fit for nothing else.

It was the custom in our boyhood not to use the milk for nine days. This waste is not necessary, as the milk after the fourth day, at farthest, if the cow is healthy, has assumed its normal condition. This, however, is no reason why the calf raised by hand should be deprived of sweet milk as soon as it is fit for other purposes. It should have only whole milk for nine or ten days, and then gradually be accustomed to skim-milk.—Farmers Tribune.

Sugar Beet Pulp takes place of green grass as a milk producer. 40c per ton. Los Alamitos Sugar Factory.

TWO KINDS OF
CHEAP
CREAM
Separators

There are two kinds of cheap cream separators.
One is the seemingly cheap kind, cheap in first cost, cheap in design, cheap in construction, cheap in efficiency, cheap in durability, and cheap in everything but merit.
The other is the really cheap kind, cheapest in propertion to actual capacity, original in design, ideal in construction, perfect in efficiency, lasting for twenty years, and barely beginning where the other kind leaves off.

That's the

DE LAVAL KIND

which compared with other cream separators is simply in a class by itself.

STARTING ASPARAGUS.

THERE are two methods of starting an asparagus bed, by propagation and by the setting out of crowns of roots.

It is very difficult to distinguish between the varieties, and doubtless many varieties come from one bed, when ordered from unscrupulous seedmen.

The growing of one's own plants is the most judicious, as the year before the working of the soil for the asparagus enables the putting of the soil in the most friable condition.

Theer are certain objections to growing one's own seed, but nevertheless it is the most profitable way. When the young sprouts appear in the spring the earliest and most desirable should be marked by stakes and when the seed appears early in the season it should be picked and placed in bags to dry.

Those selected stalks should be in bunches where it is possible that they may be easily pollenized. They should be allowed to sprout up ahead of the others in the bed so that they may be easily harvested.

It has been found that the top ten or twelve inches of the stalk does not produce the best berries or seeds, so this portion should be cut early to send the vitality of the plant to the lower branches.

Another discovery by the German scientists is that the male plants are strongest and earliest in appearing as there is not much of their vitality used in the production of seeds.

The stalks for seed production can be harvested, stored away and kept until the picking, cleaning and preserving of the seed can be done carefully.

The light seed can be separated in water for a few days to loosen the skin and pulp which is afterward easily removed by rolling in the hands. The seeds are then placed on paper to dry and should be planted within two years.

The seeds should be planted in rich, sandy soil, about one and a half inches deep in rows one and a half feet apart and the plants not closer than two inches in the row.

Very much depends upon the selection of the plants. For the most strong, healthy plants it is desirable to obtain a large one year old crown with well developed buds and plenty of roots.

The soil most suitable to the asparagus plant is a light sandy soil with a fair amount of fertility in it.

Heavy soil on which water stands, or soil in which the ground water is near the surface, is not desirable. It should be light, easily worked, and free from roots, stones or any trash which will hinder the growth of the spears.

The slope of the field should be enough to carry off the surface water. A southern exposure is most desirable, because any other means shade some portion of the day, and that is not what the asparagus will do best in.

Freedom from weeds is as necessary as fertility, and the fertility can be acquired by the heavy applications of manure as mulches. To the end that the weeds may be few, a hoe-crop for two years before planting asparagus is well.—Ex.

GOPHER POISON.

In a late number of Field and Farm, D. E. Lantz says, "pocket gophers are easily poisoned. They are very fond of common potatoes, sweet potatoes, apples, raisins and prunes. The presence of strychnine, arsenic or other poisons does not seem to deter them from eating the food but if the poison is sweetened they seem to eat it more readily. The poisoned food being introduced to the burrows below the surface, there is no danger of poisoning stock. It might be well, however, not to let swine run in the alfalfa fields for a time after the poison has been put out.

"The following method of introducing the poison is recomended: Cut the potatoes or other food into pieces not more than three-fourths of an inch in diameter. Cut a slit in each piece and with a point of the knife blade insert a little sulphate of strychnine, as much as half the bulk of a grain of wheat will answer the purpose. The moisture from the potato will cause the poison to adhere to the blade. Having prepared the bait in sufficient quantity, go to the field armed with a round, sharp-pointed implement an inch or an inch and a half in diameter and of sufficient length.

"We use a spade handle shod with an iron point. A bar is attached about 15 inches from the point to enable the operator to use his foot in pressing it into the soil. This tool has proved quite serviceable. With it it is only necessary to find the runway of the gopher. The handle is sufficiently thick to make a hole large enough to permit one to drop the poisoned potato directly into the burrow. The operator then passes to another place, leaving the hole open. No digging with a spade or other hard labor is necessary. An experienced person can distribute poison to many acres of alfalfa in a day and if proper care is taken to rightly distribute the bait it will not be necessary to go over the ground a second time.

"Some experience is required to enable one to find the burrows quickly. It is best to insert the food as near as possible to the freshest mounds of earth thrown up by the animals. Two or three pieces of potato at that place are worth many scattered in other parts of the runway. The operator should avoid the larger mounds and those that are not freshly made. In various experiments with strychnine poison for pocket-gophers no difference has been found in the results when different foods were used. Irish potatoes, sweet potatoes, raisins and prunes have all been successful baits. In no case is it necessary to go over the ground a second time."

GOPHERS.

We have done considerable experimental work at this station regarding the extermination of gophers with various devices, such as spring guns, fumigation, etc., but have found the strychnine poison to be most successful. Our plan is to take small cubes of carrot, slit with a knife and put in a few grains of strychnine, and throw these in the runways, or treat raisins in the same way, as gophers are very fond of raisins.—Portland Oregonian.

The Ornamental Garden

BEAUTIFY THE FARMS.

I BELIEVE in making the home farm a place of beauty, as well as of profit; and there is no good reason why this can not and should not be done. Let each one of us study to make our surroundings pleasant and inviting to the whole family. There is scarcely a rural home anywhere that can not be fixed us so as to have a nice appearance.

As one drives about the country among farmers, he will notice the great difference there is in the appearance of the farmsteads. Very many naturally beautiful places are unattractive because of the neglect of the owners to fix them up and adorn them with trees and shrubbery, making them neat and attractive farm homes, which should be the rule everywhere. Of course, there are cases where the owner has become old and feeble or is an invalid, where this can not be attended to, but it can usually be done if the owner has a wish to have an attractive home. Some of our native trees make beautiful ornamentals for the home and cost but the time of setting out, besides a very little pruning now and then. Paint, too, should be used much more freely than it is. True, it sometimes seems at first thought as though it costs too much, but the fact remains that at its greatest cost it is economy to paint the buildings and keep them well painted, because of the preserving qualities to the wood work, and this is in no way considering the greater beauty of the home, which, of itself, is of great importance.

I would like to have every reader of Farm and Ranch take a trip through New England, as I have done, and notice the many sets of farm buildings, all painted white, and see what a beautiful appearance they make, with everything about the premises in snug order. It looks bad to see all sorts of farm implements standing abut the farmyard and fields for weeks and months after being used, and it is the poorest kind of economy. I have always made it a practice to have all implements housed when not in actual use. There is seldom a night that finds any of my tools unprotected by a roof, and they last much longer than do most of my neighbors' tools. I like to have my tools in the best condition possible, and it annoys me very much when they are not well cared for. A farmer needs to be something of a mechanic and constantly have a watchful care over his implements, to see that no bolt or nut gets loose or lost, thus causing a breakdown. He can also, if he has a knowledge of tools, do much repairing, and thus keep the place looking neat and in better shape than if he had to depend entirely on hired help.—Farm and Ranch.

Well-rotted stable manure with four or five shovelsful of bone meal to a barrow-load, will prove an excellent fertilizer for all general purposes for lawns, flower beds, roses, shrubs, etc. But for hastening growth, preventing weeds and correcting deficient soils, the chemical or "commercial fertilizers," as they are called, are much to be preferred.

A STRANGE TREE.

We recently had the pleasure of seeing the seed pods of a very peculiar tree growing in the grounds of Mrs. G. H. Wadleigh of Los Angeles. It is known as the Jaapnese Varnish Tree, or sometimes, Chinese Parasol Tree, and technically as Sterculia plantanifolia. This tree has attracted much attention and seemed to be known only to occasional Japanese who saw it and called it simply the "Keegee Tree." The tree is deciduous, has a very large three to five lobed leaf, blossom stalk with many branches on the end of which are leaf-like pods containing from one to five carpels the size of a pea, together with a liquid which disappears before the pod is ready to open. The pod then takes on the appearance of a leaf, the carpels clinging to its edge. This leaf is entirely different in form, however, from the leaf of the tree, which has a span of nearly 10 inches, while these leaf-like pods are only two to three inches long and about an inch wide. Regarding the tree Bailey's Cyclopedia says:

"Strong growing, smooth bark, round-headed tree of medium size, deciduous foliage, leaves very large, flowers small, greenish, with reflexed calyx lobes in terminal panicles. The trees are said to be natives of China and also of Japan." One botanist maintains that the Japanese tree is only an introduction through Korea of the Chinese. "The tree is now frequently found from Georgia south, excellent for lawns and shade."

CUT WORMS.

The North Carolina station sends out the following on cut worms:

Remedial measures are to protect the young plants with bands of stiff paper or cardboard pressed into the soil surrounding the plants. They need not be over one and a half inches above the soil, as cut worms seldom climb.

Poisoned bait may be put out for the worms. To make the best use of the bait, clear off all vegetation, leaving the worms no other food. Mix a pound of Paris green or white arsenic with forty pounds of corn meal, moisten with water to a rather stiff mash, and sweeten with two quarts of common molasses. Apply this bait at sundown in little heaps near the plants to be protected. Of course, no poisoned bait should be used if chickens have access.

REMEDY FOR BORERS.

Where the trees have a rough bark remove all the projections by scraping with some blunt instrument, says American Cultivator. Then scrub the trunk and the lower part of the limbs with a mixture made by mixing one quart of soft soap or one pound of hard soap with two gallons of water, and after the mixture has been heated to boiling point add one pint of crude carbolic acid. A small amount of Paris green and lime may be added to this, if desired. With the scrubbing brush apply this mixture to the trees late in May or early in June and then twice at intervals of two or three weeks thereafter. The object of these applications is to prevent the laying of eggs and the hatching of grubs.

Canvas Goods

IN no country in the world is Canvas used to a greater extent or to better advantage than in California.

We handle the best—Living, Lemon Curing and Fumigating Tents, Irrigating Hose, Picking Sheets, Fruit Picking Bags, Stack Covers, Tarpaulins, Canvas, Khaki and Army Duck Suits, etc.

THE WORKING QUARTETTE, Cover.

HOW MANY HENS TO THE ACRE, 219.

CITRUS AND SUB-TROPICAL FRUITS.—The Olive Tree; Sour Clover; California Red and Yellow Scale: 220.

DECIDUOUS FRUITS.—The Apple in Southern California; Federal Insecticide Law: 222, 223.

LIVE STOCK AND DAIRY.—The Sire; Science and Common Sense; Colostrum and Beastings: 224, 225. Flyless Summertime: 234.

SMALL FRUITS AND VEGETABLES.—Asparagus; Gopher Poison: 226.

ORNAMENTAL GARDEN.—Beautify the Farm; A Strange Tree; Cutworms; Remedy for Borers: 227.

EDITORIAL.—A Protest and a Promise; Citrus Growers' Meeting; Importing Plants from Florida; Capitalizing Farming: 228.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast: 229.

PROFIT IN THE POULTRY YARD.—A Plea for Better Fowls; Boracic Acid for Sorehead; Poultry Queries; Fleas; Belgian Hares: 230, 231.

BEES AND THEIR CARE.—Organize Bee-Keepers; Anatomy of the Honey Bee; Sweet Clover: 232.

GENERAL AGRICULTURE. — Who Pays the Freight; Parcels Post; Per Cent of Grade: 233.

QUERIES AND REPLIES.—Planting Olives; Poultry Manure; Warts on Teat; Peaches not Setting: 234.

HOUSEHOLD.—Her Insomnia; For the Economical Girl; Do not Leave Food Around: 236, 237.

PRODUCE MARKETS.—Los Angeles Market, San Francisco Market, Deciduous Market, Citrus Market: 238, 239.

A Protest and a Promise.

In active life the pendulum is never stationary—it either indicates development, a positive consideration; or it shows a decline, a decadent state. Indeed, in a man-made universe of business, we are all succeeding or failing, the extent of the process either way being merely a matter of degree. Ceasing for the moment to discuss the matter in the abstract and treating it in the concrete based on personal experiences, it is a pleasure as well as a gratification for The Cultivator to state that its office pendulum is swinging in the right direction; that the paper has grown from an annual deficit to an annual dividend; that its advertising patronage has increased beyond its most sanguine expectations; and that its subscription list has reached beyond a total of 15,000 names. For which its present owners are not only proud but grateful. Proud in the possession of the confidence and friendship of the men and women that are extending California pomology to the four quarters of the earth; grateful in a realization that but for this support and esteem so great a growth was impossible. The addition of new blood, the acquisition of ample capital coupled with a corresponding promise of still greater and better things in the way of improvements, has forced expression to these thoughts and explains their utterance.

The Cultivator is just old fashioned enough to believe the somewhat musty proverb "That honesty is the best policy" still holds good even in an age of graft and "velvety" workers of rural populations, which gives emphasis to two things, namely, that it has never tolerated stock selling schemes, questionable agricultural land deals on the installment plan, crinoline clubs offering memberships to people who will buy 52 cents worth of subscriptions of impecunious publishers, or supplying mental pabulum on finance to the unwary; quite to the contrary, The Cultivator has ever given a liberal measure of value alike to subscribers and advertisers. Indeed, it may be pardoned for calling attention to the fact that it has excelled in volume of original matter published; its regular corps of contributors constitutes a greater number of scientific and practical men than that of all other coast farm papers combined.

Needless to add, in a modest way The Cultivator believes thoroughly in itself; it believes that it has been a force in the development of California horticulture and agriculture; it believes that our resources in soil, climate and production have scarcely been touched by the hand of man; and that within the next decade the state will experience a growth much beyond anything that has yet transpired; it has faith that the men and women who are making horticultural and agricultural history in California cannot hope too much nor dare too much; it is proud to maintain a humble position with so gallant an army of workers, being convinced that it can render a service that shall really be worth while. The Cultivator hopes to do this by being faithful to its mission—true to its ideals and a robust citizenship that shall make rural and suburban life attractive and the pride of this western country.

The Cultivator glories in the great future of the Pacific Coast, and more especially in its own California from the forest-clad hills of Del Norte to the alfileria covered mesas of San Diego. All portions of this sun-kissed land are dear to its heart. It is proud of the friendship and loyalty of its readers, nevertheless it has an ambition to grow still closer to the hundred thousand contented and prosperous people that are attached to her soil.

The men who now own and control The Cultivator bring to their duties a long novitiate in the University of Hard Knocks, both in field and factory as well as in orchard and office. In spite of that, however, they are keenly alive to the fact that one swallow will not make a summer, neither will a few people's opinions and practices trickled over the printed page make a practical farm paper. Quite to the contrary, a really helpful paper will give the best thought and practice of the most successful in rural industry. Appreciating this, they hope to lean more or less on the brains and brawn represented in their thousands of readers. As for the owners, they love what is true and good, hence will always strive for the "square deal:" in the treatment of public men and measures they hope at all times to be just and to fear nothing from without; to think a little and to act kindly and sanely. In short, to do their work by the best light as they see it from day to day.

Citrus Growers' Meeting.

The Cultivator readers will recall an article a few months ago touching upon the profitable bearing age of citrus trees. In that article the opinions expressed by growers varied, but generally they discredited the theory that the limit of profitable bearing could be placed at 20 years. The majority contended that with proper soil conditions, irrigation, cultivation and pruning, even trees reduced to low producing capacity may be brought back to profitable bearing. Many felt that our experience has not yet been sufficient to justify an intelligent answer.

Following this special article, Mr. Chas. R. Paine of Redlands furnished a couple of short articles on the subject of pruning. He maintained that the cutting out of certain worthless limbs of orange trees such as would result in giving the "shape of an inverted cone" would be beneficial. Methods for doing this and for handling the suckers which follow were also described by Mr. Paine. These articles were commented upon favorably by citrus growers, but the question was by no means settled, and the desire for more explicit information suggested the holding of a convention of citrus growers to discuss it still further. The state horticultural commissioner was appealed to to take the matter in charge. He has done so and a meeting will be held at Pomona on Tuesday and Wednesday of next week. Representative horticulturists and men trained to study scientific problems of citrus culture will be present, and a most helpful discussion of a subject as yet so little understood is expected.

The next annual meeting of the American Association of Farmers' Institute Workers will be held in Washington, D. C., November 14-16. Beginning on the last day of this convention the annual meeting of the Association of American Agricultural Colleges and Experiment Stations will convene. These are important meetings for those engaged in farmers' institute work.

Capitalizing Farming.

The farms of the United States produce an annually greater wealth than any other industrial item excepting the combined gross income of manufactories. The value of farm products last year aggregated $8,760,000,000. The gross value of products of manufactories was for foods and kindred manufactures, $2,845,000,000; iron and steel and their products, $2,176,000,000; textiles, slightly over $2,000,000,000; total of all manufactured products, including the above, $14,802,000,000.

The use of capital in these manufacturing industries is well known; the great combinations of capital have grown until they present one of the serious problems before the country. Such a combination has never been suggested in farming. To be sure some big stock ranches and other enterprises have attracted large capital, but to no such extent as in manufacturing. In addition, almost invariably, the farm is a small unit. The Review of Reviews has an article by Milton Whitney, Chief of the Bureau of Soils, in which he makes the suggestion that ultimately capital will be drawn to farming and will put it on a more economical and successful basis.

With the use of power, which will become more general on the farm, we believe the opening is here for such use of capital. A large orange grower of Riverside remarked to us some months ago that he felt the time might come when the small orange grower would be displaced by large aggregations of capital. One or two large orange properties in California producing the best of fruit in orchards run most economically, give some color to the thought. May not the small fruit grower realize this and the advantages to be secured from having at the head of his undertakings the highest intelligence? May there not be a combination of properties under one management?

The citrus growers have proved that one manager of marketing operations is vastly superior to every man managing his own. One great obstacle will be the reluctance of the farmer to relinquish his hold upon his own property. For greater production less expense is required. Let our farmers study how this may be done.

Importing Florida Plants.

Nearly every week the Cultivator receives letters from subscribers asking names of nurserymen in Florida or containing request similar to one received this week, "Where may I secure a certain plant? I have catalogue of a Florida nurseryman, but wish to get plants nearer home." These inquirers are evidently ignorant of the regulation of the state horticultural commission that nothing with green leaves can be received from Florida. Even seeds have been quarantined. The existence of this ruling and the necessity for it should be known to every fruit grower in the state. It was made because of the danger of introducing whitefly, one of the deadliest pests of citrus trees. Several infestations of this insect were found at one time in the state and thousands of dollars have been spent to eradicate it—if it has been eradicated. If it still remains, the fight will be renewed, and we believe the pest will be controlled.

Agricultural News Notes of the Pacific Coast

Northern California

The Ferndale Fair is on this week.

Chico is affected by a plague of mosquitoes.

Ukiah, Mendocino county, had extensive forest fires last week.

The University Farm at Davis has several new buildings under way.

A farmers' institute will be held at Gridley, Butte county, September 20.

Corning, Tehama county, estimates 700 tons of peaches as its output this season.

Sutter county vineyards show active work in drying Thompson seedless.

Shasta county is making a fine exhibit of its products in the Ferry Building, San Francisco.

Pickles and oil to the value of $100,000 will be produced by the olive groves of Corning.

The supervisors of Butte county served notice on irrigators not to waste water on the public highways.

The State Fair, together with the festival, Dawn of Gold, is attracting great crowds to Sacramento this week.

Rice production in the Sacramento Valley still looks attractive and experts declare that crop will be a staple.

Yolo county fruit growers have been much dissatisfied with work done by Hindus who have been tried this season.

Apple growers in the hills of Butte county report the production this year of some of the finest fruit yet shown in the state.

The demand for hop pickers in northern Sonoma county called for a special train load of pickers on the Northwestern Pacific.

Central Creamery at Ferndale, Humboldt county, is extending its branch creameries, one being as far south as San Luis Obispo.

Forest fires covering many square miles have been raging for some time near Enterprise, Butte county. For a time the town was threatened.

The harvesting of the almond crop at Biggs, Butte county, shows nuts f very superior quality and the crop y far the largest ever produced.

The California Wine Association nnounces that it will not set the rice on wine grapes this year, but will make bargains for all that may e offered.

A car of plums shipped from Vacaille early in July sold in London early a month later for $2,406. They were Wicksons and Eurekas. The reight charges on the car totaled 1,110.32.

The special session of the state legislature convened at Sacramento last Tuesday. The special work has o do with bonding the state and the ounty of San Francisco each for 5,000,000.

Superintendent Peiper of the forage plant growing experiments which he Department is conducting at hico, declares that of more than a housand forage plants tried, nothing as equaled alfalfa.

Central California

Kerman has proved itself able to produce some exceptionally fine broom corn.

W. R. McIntosh will aid in farmers institute work in the San Joaquin Valley.

The Kings County Fair will be held in Hanford the week beginning October 3rd.

Hanford, Kings county, claims the production of pears weighing 24½ ounces each.

It is claimed that this year's barley crop will be the biggest California has ever harvested.

The foothills west of San Jose were visited last week with field fires which swept over many farms.

Tulare county fruit growers are making an exhibit of their products at the state fair this week.

A carload of engines to be used largely in irrigation work was received at Porterville last week.

Wineries at Lemoore and Armona, Kings county, are now paying ten dollars per ton for wine grapes.

Over 1000 acres of grain were destroyed last week near Tulare by sparks from a harvester engine.

The Kerman creamery is engaged in introducing and selling to farmers high grade dairy cattle, already having sold 300.

Buyers of dried peaches at Hanford, Kings county, are freely paying five cents with some growers holding for still higher.

The eastern manager for the California Fruit Growers Exchange inspected the orange groves of Tulare county last week.

Valencia Heights near Porterville will have its planting of Valencias increased by 140 acres, to be planted the coming season.

Alfalfa lands near Porterville, Tulare county, are provng of great value because of the ease with which artesian wells are secured.

Raisin grape picking began in the Fresno section about August 15th, though the muscat picking was not fully on until the 25th.

The season for shipping peaches closed in Porterville last week. For over two months 15 to 20 cars of peaches have been shipped daily.

The first beets at the sugar factory at Spreckels, Monterey county, were delivered on August 15th. The factory expects to run about 100 days.

Work has been planned for the drainage of 10,000 acres of rich farm lands near Kerman which calls for the construction of twelve miles of concrete ditches.

The building of a dam by farmers in Tulare county on the south fork of the Tule river caused an action to be taken by the South Tule Independent Ditch Company to prevent the diversion of the water.

County Horticultural Commissioner Schulz reports the installation in Tulare county of a colony of parasites expected to work on infestations of mealy bug. The parasite was brought from the Philippine Islands by George Compere.

Southern California

Cotton picking is in full swing in the Imperial Valley.

Valencia growers are receiving nearly a dollar a box more than last year.

Orange county reports one sale of the coming season's walnuts at 13 ¾ cents.

Bean threshing in Ventura county makes busy times with the lima bean producers.

The Covina Valley Farmers Club recently held a moonlight picnic and club meeting.

Bean harvesting has been completed on the big San Joaquin ranch in Orange county.

Small white beans are being delivered at the warehouse in Saticoy, Ventura county.

Escondido is making preparations for her agricultural fair to be held September 27-30.

Puente, Los Angeles county, is shipping a carload of beets a day to the Chino sugar factory.

Walnut packing houses and their equipment are being made ready for the fall pack of nuts.

Orange county apricot growers are winning step by step in their fight for fair prices for dried cots.

The state fertilizer inspector visited Redlands last week taking samples of fertilizers offered for sale.

Pomona is planning for a great meeting of citrus growers to be held on September 13th and 14th.

Arlington, Riverside county, is to have a modern creamery plant conducted along co-operative lines.

Some walnuts have already been gathered, but the season will not be fully on until about September 15th.

The Rivera Fruit Association reports 113 cars of oranges shipped this season as against 167 last year.

The Palo Verde Land Hearing case has resulted in the recognition of the rights of those who had filed on the claims.

The county game warden of San Bernardino county received and liberated in the mountains last week 30 wild turkeys.

Less than 1000 cars of Valencias remain to be shipped. The output will prove to be about 25 per cent. lighter than last year.

Glendora, Los Angeles county, Citrus Association, shipped to President Taft a box of fancy Valencia oranges packed in an oak box.

The Santa Ana Valley Irrigation Company has just purchased a ranch near Olive for the purpose of securing a number of valuable wells on it.

One of the biggest ditch contracts yet let in Ventura county was by the American Beet Sugar Company for a $19,000 ditch to carry waste water to the ocean.

Preparations are under way for a most important convention to be held in Los Angeles October 3-8. It will have to do with the physical and chemical conditions of the soil of Southern California.

The Coast

Bluestem wheat at Spokane is now quoted at 87½.

The first hops were picked in Yakima, Washington, on August 29th.

The first lot of 1910 hops delivered at Portland, Oregon, was on August 24th.

Palouse county, Washington, boasts of wheat standing over seven feet high.

The Territorial Fair of Arizona will be held this year at Phoenix, November 7-12.

Columbia county, Washington, is shipping grain at the rate of 25 cars every day.

Tomatoes and melons at Dayton, Washington, were killed by frost August 25th.

Eureka Junction, Washington, reports the grain output as fair with quality excellent.

Western Canada will produce in excess of 100 millions of bushels of wheat this season.

The Milton-Freewater section in Washington is averaging fifteen cars of high-grade fruit daily.

All harvesters at Colfax, Washington, have come in from the fields and the year's harvest is ended.

Governor Hay of Oregon has urged all sawmills to close down and use every effort to subdue forest fires.

Several arrests have been made of those charged with being responsible for the forest fires in the Northwest.

Harvesting at Harlowton, Montana, is completed and both irrigated and dry farm crops are reported excellent.

Farmers at Palouse, Washington, are being offered only 74 cents for wheat delivered in warehouse. This they are refusing.

Farmers at Dayton, Washington, estimate that they have lost $145,000 because of decline in price of wheat which they were holding.

Alligator farming is becoming very profitable in the island of Mindanao and many skins are shipped to the United States for manufacture.

After more than 300 people have lost their lives in the forest fires of the Northwest, improved weather conditions have aided in bringing the fires under partial control.

A thorough canvass of the hop ranches in Salem Valley, Oregon, shows the crop will run from 95,000 to 105,000 bales. An effort is being made for cleaner picking than has ever been given to hops in that valley.

A departure was made in hay production at Pullman, Washington, this year where timothy has been the standby. Owing to the drouth, much wheat seeded for grain was cut for hay and the experiment is proving successful.

The next Dry Farming Congress will be held at Spokane, October 3-6, and rumor has it that Los Angeles will make an effort to secure the convention for 1912. It is conceded that Colorado Springs will have the congress for 1911.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma
Germain Seed & Plant Co.,
Distributing Agents for
S. California

Baby Chicks, Laying Hens, Pullets, Etc.

On hand every day of the year. Free 32-page catalog gives prices, descriptions, etc. We ship to every town in the West. Our prices are lower than any other dealer, as we buy more and sell on less margin of profit. We can fill orders for White and Brown Leghorn hens, 10 months old, Barred Rock, Rhode Island Red and Black Minorcas 10 months old. We have Black Minorca, Rhode Island Red and Buff Orpington pullets 2, 3 and sometimes older. Send today for catalog. State what you wish—kind, age and quality, and we can name the price.

We can fill orders for Reds and Barred Rock chicks every Tuesday at present.

Profit in the Poultry Yard

A PLEA FOR BETTER FOWLS.

POULTRY raising should be one of the farmer's most profitable lines, but as conducted today it yields little profit and in many instances is an actual loss. How can this be changed and farm poultry made to not only pay its way but yield a fair profit to the farmer? Simply by giving the chickens as careful attention as the horses and other live stock receive—by studying their needs, housing properly, feeding a balanced ration and keeping houses and yards in sanitary condition.

"But," says the farmer, "I haven't time to fool with the chickens."

Yet he has time to fool with the cows, the hogs, the horses, though they yield a lower percentage of profit than the chickens.

Lack of time is a poor excuse for neglecting the poultry. A flock of one hundred hens need take up but little time and yet be well cared for, but it requires some system. First, the houses must be built so that they may be conveniently cleaned, therefore the simpler the construction the better. Make the sides tight and of smooth lumber. The floor should be of earth. If the ground is not naturally gravelly put in a 12-inch layer of gravel and cover it with sand. Keep it well covered with straw. Some poultrymen prefer board floors, but I have found that they are more apt to be damp and are harder to keep clean than dirt floors.

Perches require frequent oiling or painting with lice killer, so for convenience must be made either removable or hinged to the wall. I have mine hinged, and when cleaning out the droppings I simply raise the perches and hook them against the wall. Heavy breeds of chickens should have perches not over two feet from the floor, as flying from higher ones often causes "bumble-foot."

And another point—don't make your perches ladder fashion for any breed. Set them all the same height, for if you don't every hen will try to perch on the topmost roost, which causes undue crowding.

If nests are placed in the roosting room see that they are where they will not become covered with droppings. An excellent plan is to have them along the wall beneath the dropping platform. Let the wall of the poultry house form the back of the nests and have it hinged, making a long door that may be raised or lowered at will. In this way the nests can be cleaned and the eggs gathered from the outside.

Now, with houses well made and conveniently arranged and feed kept handy, will the care of that one hundred hens take more time than the farmer can spare? Let's see. There's feeding in the morning. If grain is used it requires but a few minutes to prepare and feed it. A mash will take a little longer. Then the drinking fountains must be filled, the grit and charcoal boxes replenished frequently, and two or three times a week some green bone and oyster shells ground up. There's feeding in the afternoon and possibly a light feed at noon. On the average farm the amount of feed required during the summer months will be small if the fowls have the run of the farm. Insects, green food and waste grain around the barns will provide a large portion of the necessary feed.

Cleaning the houses will not require a great amount of time if it is attended to regularly. I find it best to remove droppings daily, but this is not absolutely necessary. Every second day will do, or under some conditions twice a week is often enough. The houses ought to be whitewashed once a month, and perches oiled every two weeks. The straw on the floor and in nests must be changed frequently.

With the coming of spring there will be broods of young chicks to care for and that is where extra work comes in. More care is required in feeding and there will of course be more or less trouble of one kind or another. Bowel troubles, gapes, and lice are possibilities, but with care they may be largely avoided. Brooders eliminate the gapes if the chicks are kept off the ground. Bowel trouble is caused by improper feeding. There is no excuse for losing chicks from lice.

Various little details must be looked after in the care of the chicks and hens, but they need not take so much time as to interfere with the farmer's regular work. The housewife can help in caring for the chicks, but don't put the burden on her of doing all the work connected with the poultry.

Give the hens a fair show this year. Feed and house them properly; keep a record of your expenditures and income, and see if your balance sheet does not make a satisfactory showing at the end of the year.—Successful Poultry Journal.

BORACIC ACID FOR SORE HEAD OF TURKEYS.

This is a remedy that is new to me, although it may be old to readers of the Cultivator, but I shall give it for what it is worth. Lately I had occasion to witness the almost magical effects of boracic acid solution in a bad case of swelled eye from poison oak, so when a sick turkey was reported I hailed the opportunity to test it in this. My turkey wasn't very badly affected, but there was considerable swelling around one eye and a frothy discharge from the nostril which indicated approaching trouble, so I dissolved in boiling water all the boracic acid powder it would take up, and as soon as the stuff was cool enough I applied it, full strength, just as recommended for poison oak. Next morning I could scarcely tell which turkey I had treated and a second application has not been needed, so I will pass on the item, in the hope that it may meet the eye of some one who may need the help without the delay of sending an inquiry.

The poison oak case was treated by applying cloths wet in the solution just as hot as could be borne, changing the cloths as fast as they cooled. They took the swelling and pain down in a wonderful manner.

For the turkey I simply dipped the head into the solution until Mr. Turk strangled and let him go, of course not using the medicine as hot as for human flesh—just warm, was all. Try it.—Mrs. Frank Metcalf.

A Healthy Chicken is an asset; a sick Chicken is a liability: because it is apt to give disease to others, it's therefore a loss, not a gain

To keep your poultry healthy—to make every hen an asset, regularly use in the feed twice a week,

Coulson's

No. 3 Condition Powders

Give it to well chickens to KEEP them well, give it to sick chickens to MAKE them well.

Helps chickens to digest and assimilate all their food, makes hens lay right up to molting and starts them laying quick after the molting season.

POULTRY QUERIES.

Best Breed.

We have a letter from a San Bernardino lady who has tried two breeds of poultry side by side and finds a material advantage in one and disadvantage in the other. There are two things which prevent us from giving this letter in full. The first is that the letter, while well written, is signed merely "Subscriber," and the second is that we do not like to print articles which make direct comparisons, showing inferior qualities of any one breed. Our favorities may be spoken of as highly as actual tests prove them worthy, and we will be glad indeed if the San Bernardino "Subscriber" will send us an article, over her own name, though her name need not be published, touching upon her favorite breed, telling how young they began laying, and other valuable points.

We take this position because a single test does not prove the permanent worth or otherwise of any one variety, and, besides, a breed which one person finds inferior, another in a similar actual test, but perhaps covering a longer period of time, has found to be superior.

Cropbound.

Will you tell me why the crops of my turkeys harden for a day or so, when the birds appear sick. I feed wheat and barley, provide plenty of pure water.—Miss M. F., Orland.

We should judge that the birds have been overfed dry grain, which at times distends the thin muscular walls, exhausts and paralyzes them so that the organs cannot discharge or be emptied. A cure consists in a change of rations. Give soft foods, plenty of green stuff with a pinch of animal food. If severe, force a little castor oil down the food passage. Impaction is often due to over-feeding and subsequent swelling of grain rations.

Lice Killer.

Can you tell me in your next issue of a good lice killer for use on chickens, which takes less time and labor than a powder. Also a remedy for chicks having one side of head and eye swollen and full of watery matter.—C. P. W., Willows.

Any of the liquid lice killers to be had of the supply dealers will meet the requirements. When applied according to directions they are invariably effective. Birds are suffering from a severe cold, which, if unchecked, will degenerate into roup. Give a dozen homeopathic pellets in a quart of water. If this fails, give equal parts of cayenne pepper, ginger and mustard, mixed stiffly in lard, then flour worked in; form into pellets about the size of a hazelnut; give by opening the mouth and dropping down the throat.

FLEAS.

Answering a question in the American Journal as to control of fleas Prof. M. E. Jaffa writes:

The fowl flea, like the fowl mite, is termed a partial parasite—that is, it goes only to its host to feed, and for this purpose has a sharp, piercing mouth. From the fact that they feed only at night they are not always noticed on the fowls, still they are the cause of much irritation and loss of blood. The female flea lays her eggs amongst the dust and dirt and in the cracks of the walls and roots. The first thing to do in cases of infestation is to take everything movable out of the house, such as nest boxes, roosts, etc., and spray or paint them carefully with a mixture of thin crude oil with 10 per cent crude carbolic acid (90-95 per cent). Kerosene and carbolic is also good. The house, especially all cracks, crevices, knot-holes, etc., should be carefully painted or sprayed with this same material. A second application three or four days later is often desirable. This treatment is to free the house from fleas and keep clean. For the fowls, one of the best powders is that recommended by the Maine station. It is made by taking three parts gasoline and one part crude carbolic acid (90-95 per cent). Mix these together and add gradually while stirring enough plaster of Paris to take up all the moisture. As a general rule it will take four quarts of plaster of Paris to one quart of the liquid. The liquid and the dry plaster should be carefully and thoroughly mixed. When enough plaster has been added there should result a pinkish brown powder having a fairly strong carbolic and gasoline odor. While one application of this powder to the fowl might kill all the vermin, there are always some unhatched eggs, so a second application should be made three or four days later. The Maine station reports most excellent results with this cheap but effective powder.

Belgian "Hares."

Do you raise Belgian hares? If so, you have something that is mighty fine for meat. When you kill one, skin it so that the skin comes off in one piece, and dry it good and save it to make a fireless brooder with. It is really a pleasure to watch a lot of baby chicks nestle under a hover made of rabbit skins for they seem supremely happy and content, comfortable and warm.

Heat is life, cold is death. If you do not keep your chicken houses cleaned out, you may expect to have vermin; the more lice, the less profit. The latest on the chicken disease question is that lice, like the mosquitoes to the human family, carry disease. If your chickens get the roup the first thing that you want to do toward stamping it out, is to kill the lice. Sparrows carry lice, as do probably all birds; the writer once saw a Texas mocking bird that had just been shot, and there were lice on its head. Don't let the sparrows nest around your chicken houses. When you clean out the houses, paint the roosts with crude carbolic; have the roosts removable, so that you can get at both sides. If you find coop lice it will pay you big to spray the whole house. Lice eat up the profit and often the chickens too. Get rid of the lice.—N. W. Poultry.

Capons, generally, are dressed by leaving feathers on the neck from the head down two-thirds to the shoulders. They are also left on two first joints of wings, on tail, half way up the back, and on legs from knee joint two-thirds up the hips. All the rest of the feathers are taken off.

Some markets prefer the head of the fowl taken off at the throat. Strip the blood out of the neck; peel back the skin a little; remove a portion of the neck bone; and then, just before packing, except in warm weather, draw the skin over the end and tie and trim neatly.

Santa Ana is planning for a great Carnival of Products to be held next month.

EGG MAKER

I Have Ten Hens and Get Ten Eggs Each Day

by feeding "Lee's Egg Maker." Without waiting another day, go out and count your hens—count them carefully. For a week keep an accurate daily record of the eggs you get. The guarantee below means *you*.

WE GUARANTEE

that no matter what you are feeding, and regardless of the number of eggs you are getting at the present time, if **Lee's Egg Maker is added** to the daily ration — made a portion of it — the increased egg yield resulting therefrom will more than pay the cost of the Egg Maker, cost of labor required, and **100 per cent profit** on said labor.

We don't care what your hens are doing *now*, we ask you to buy Lee's Egg Maker on our *guaranty* of an *increased* egg-production at a *reduced* feeding cost. Could we make you a better proposition?

The amount of good *digestible* protein is what counts for results in poultry feeding, and America's big feeders say Lee's Egg Maker contains more *digestible* protein than any other poultry food they can buy.

Lee's Egg Maker is almost entirely a meat food and with an actual tested protein feeding value in *excess* of *80* per cent, and you'll find in it the essentials entirely lacking in other prepared poultry food. The best feeding authorities in the country endorse it—and *use it*. *You* can't afford *not* to feed it, whether you have 10 hens or 1000, the proportionate profit would be the same.

Price: 2½ lb. pkg., 25 cts., 25 lb. pail, $2.00. Ask your dealer or send direct to us. We pay freight in 100 lb. lots.

Bees and Their Care

BEE-KEEPERS MEET.

THE Los Angeles County Bee-keepers Club met in Los Angeles last Saturday and discussed papers by Mr. Ferree of Newhall, Mrs. Acklin of Glendora and Mr. De Sellem of Hollywood. Extracts will be made from Mrs. Acklin's and Mr. Ferree's later. From Mr. De Sellem's we quote:

By Geo. B. De Sellem, Hollywood.

This is distinctively an age of organization. From the billion dollar steel trust to our local dairymen's association, we see this, and we cannot deny the influence, power, and results of thorough organization. Our own citrus fruit growers' and walnut producers' associations are of inestimable value to the individual member. Our lemon producers, though widely separated, acting as a unit through a strong central organization, have, the present season, through the Interstate Commerce Commission, compelled our transportation companies to be fair as to freight rates east on lemons, and secured for their product the advantage of the protection intended for them under the new tariff schedule. In a small way, only country-wide, this club did a great service to every apiarist in the county, for immediately after its formation, our efficient President and Secretary secured an ordinance from the county board prohibiting importation of bees from any infected district, and in addition to this, the Southern Pacific Company through its general freight agent at San Francisco, instructed its local freight agents to refuse to receive any bees for shipment to our county from infected districts, and all must have a clean bill of health. I do not know whether or not European Black Brood had appeared in the Fresno district last winter, but our reports indicated that it had, and I do know that the action of the club was timely and commendable. In my work this year I have noted with great pleasure the universally fraternal spirit of our bee people. Their willingness to assist and co-operate with every brother and sister in the business in their respective districts; the entire absence of a petty, jealous spirit among our bee-keepers everywhere, is commendable, and in the most unfortunate neighborhoods the bee-keepers were delighted to learn of a more favored district which gave promise of a surplus. I cannot lay too much stress nor congratulate you too highly on this, because, while we cannot order the seasons, we can, by united effort accomplish great things for the industry both in production and marketing. Had I the time to tell and you the patience to listen, I could spend an hour telling you how I have been assisted in my work this season by the noble men and women of our county, and how greatly this valuable assistance has been appreciated.

In the matter of the production of a good year, the bee-keepers' yards must be kept free from infectious diseases, to be profitable or to enable him to continue in the business, and this is possible only by the hearty co-operation of all the bee-keepers in the district.

We are fortunate in having as members of this club veterans in the business, men who can speak with authority, graduates of the best school on earth, that of experience, and because of this, if we are wise, we will heed their counsel. In all other lines of industry, the get-together plan seems to be the successful one. Make prices, receive bids, accept offers, make shipments, through one central house by the duly accredited agent of the association, and if this is the Shibboleth of success in other lines of trade and industry, why not in ours?—Geo. B. De Sellem, L. A. Co. Bee Inspector.

THE ANATOMY OF THE HONEY BEE.

The U. S. Department of Agriculture's recent publication, on "The Anatomy of the Honey Bee" (Bul. 18 Tech. Series, Bureau of Entomology) embodies the results of detailed studies and should prove of value as bringing to bee-keepers a fund of formation concerning an insect of such great economic importance, and also as furnishing a sound basis in devising new and improved practical manipulations. The subject has been for years the object of study of many careful students; but the popular demand for information has also induced untrained men to write accounts of bee anatomy containing numerous errors, and illustrated by drawings more artistic than accurate.

All practical manipulations of bees must depend on an understanding of their behavior and physiology under normal and abnormal circumstances and this knowledge must rest ultimately on accurate information as to the structure of the adult bee.

Following a brief instroduction the author first gives a chapter on the "General External Structure of Insects," and then taking up the Honey Bee he gives a detailed description of the head of the bee and its appendages; the thorax and its appendages; the abdomen, wax glands, and sting; the alimentary canal and its glands. He discusses the circulatory and respiratory systems, the fat body and the oenocytes, the nervous system and compound eyes, and the reproductive system. The text is profusely illustrated, fifty-seven figures, including a full page median longitudinal section of the body of worker, being used, all but three of which are new and original, having been prepared by the author with a thorough realization of the need of more accurate illustrations of the organs of the bee, especially of the internal organs.

This bulletin can be secured only from the Superintendent of Documents, Government Printing Office, as the Department's supply is by law limited to an edition barely sufficient to furnish libraries and the collaborators of the Department with copies.

The last meeting of the Santa Rosa Grange adopted resolutions urging the State Superintendent of Public Instruction to advance as much as possible the study of agriculture in high schools.

The San Jose Grange has recommended the calling of a fruit growers convention which will consider the matter of fruit standardization.

General Agriculture

WHO PAYS THE FREIGHT.

DO GOOD roads concern you? If you are one of the 30,000,000 people who live on farms in the United States, it is a fairly safe guess that you know something about bad roads, even if you do not know and have never chanced to cross the seven per cent of improved roads of the total two million miles of highway in the United States.

But if you are a city dweller, whose use of the highway consists chiefly of the street railway, does the good-roads movement concern you? That question is best answered by asking another. When the price of wheat goes up from 70 cents to $1.30 a bushel, and the price of potatoes from 50 cents to $1.25, and the price of bread from 6 to 10 cents, and the price of flour from $4.50 to $7.50 a barrel—do those facts concern you? If they do, then you are vitally interested in good roads! Take wheat, for instance! Do you know why it is possible to corner the market in wheat? First of all, because wheat is scarce—the demand growing faster than supply; but secondarily, because, owing to the condition of the roads, it is possible for speculators to get possession of the whole year's crop of wheat. The West is the great granary of the wheat supply today; and in the West wheat must be rushed to market in the clear, dry autumn days when the prairie roads are hard as flint. If the farmer held his wheat over, past the dry weather, in the most of counties he simply could not deliver during late autumn rains or early spring break-up when roads are a churn of mud. The result is, for three months after each crop, there is a glut of wheat at elevator, railroad, water-front. A large proportion of the crop goes in storage. These storage charges amount in a grain center like Chicago to as much as nine cents a bushel in a year. On Minnesota's wheat crop, storage charges mount up to $5,000,000; in the two Dakotas, to twice as much, and so for every grain area on the continent. The farmer does not pay those storage charges at water-front. The speculator does not—he adds those charges to the selling price; and the man who pays is the buyer—you, Mr. Town Man, who eat dear bread all because some mud road back in a Hoosier state has not been graded up properly.

As a matter of fact, America's country roads are so notoriously bad that it costs more to haul a ton of wheat from farm to market than to ship that ton from New York to Liverpool. America's country roads are so bad that it costs the American farmer 23 cents to haul a ton, when it costs the English or the Belgian or the French or the German farmer only from 7 to 9 cents for the same haul. You, Mr. Town Man, and you, Mr. Farmer, pay for the unnecessary waste of those bad roads, the town man by extra cost of what he eats. the farmer by lessened profits on what he sells. The same reason explains why the town man pays $1.25 in spring for potatoes which cost from 50 to 75 cents in the autumn.—Colliers.

WANTED, A PARCELS POST.

A government institution that the people want and the country needs is a parcels post. It is long overdue. We should have had it years ago. But the best things are not easily secured. They come slowly. Waiting and wanting edge our appreciation, so that when the object is gained it is suitably prized. If a general parcels post, broad enough to compel its prompt success, were to be established in this country, it would meet an appreciation and command a support that would be adequate endorsement of it as a Government enterprise in the interest of the people.

Postmaster-generals in all recent administrations have favored a parcels post. Secretly and inactively an overwhelming majority of the people welcome it; but there has been sufficient petty opposition of over-estimated power to keep it in the theoretical stage, with the hope among its enemies that it would die out. Politicians pressed for an answer as to their attitude toward the proposition have usually made promises with remote redeeming clauses, or put their constituents off with political explanations. Whatever the devices employed in answering the public's demand for this useful and increasingly necessary service, the time has come when nothing less than active, persistent, resultful effort to bring a parcels post into practical, working existence will satisfy aroused citizens.

Congress as the nation's lawmaking agent can bring a parcels post into existence if the members of that body are given orders of unmistakable urgency by the people. Farmers have it quite largely within their power to compel congressional action on the matter, and if their zeal for a parcels post accords with an intelligent understanding of its immense benefits, they will let their congressmen know what they want done about it.

It is time to go after a parcels post with that conquering weapon with which every qualified male citizen is endowed—the ballot.—Breeders Gazette.

PER CENT OF GRADE.

A one per cent grade on a road means a rise of one foot for each hundred feet of distance traveled up the hill. A ten per cent grade means ten feet rise in each hundred feet so traveled. A one per cent grade, then, means that in traveling up hill one mile an ascent is made of 52.8 feet, while a ten per cent grade means a rise in altitude of 528 feet in a mile. Accurate tests have shown the Minnesota Experiment Station that a horse which can pull 1,000 pounds on a level road can pull only 810 pounds on a rise of one foot in fifty, and on a rise of one foot in ten he can pull only 250 pounds. These facts show that the greatest load that can be hauled over a road is the load which can be taken up the steepest hill on that road, or through the deepest mud hole. It is therefore advised that all highways traveled by heavily loaded vehicles should be kept within a three or four per cent grade if practicable. To do this may require a change of location to get around hills, always keeping in mind that the lower the grade the larger the load that may be hauled and the cost of haulage kept at the lowest point.

Planting Olives.

What is the best time of the year in this locality to plant olive trees in orchard? Which is the best bearing variety? In raising olives in nursery which is the best to plant for seedlings to be grafted later, and where may one procure them? Will fruit trees, and especally olives, need to be irrigated after the third or fourth year where it is only eight to ten feet to water?—N. M., Lindsay.

After the ground is thoroughly warm in the spring is the best season for planting, say after the end of March. The best bearing variety is the Mission, although other varieties have their good points. Seedlings are not used in nursery reproduction of the olive. They are usually grown from small tips in the form of herbaceous cuttings. These come true to the parent, so no budding is necessary. In a similar way they are sometimes grown from the truncheons or ripened wood cuttings which may be procured from any orchard which is known to produce good sized fruit in abundance of the kind desired.

It is possible olives would do well without irrigation on ground eight or ten feet to water, but we would prefer to be provided with irrigation water in case of emergency. Some orchards have been grown on hillsides without receiving any irrigation. These trees produce fruit, but not in such paying quantities as when irrigated. In fact one of the largest olive orchards in California is not irrigated at all.

Poultry Manure.

How far will the droppings from 500 hens yarded in orange grove go towards fertilizing 600 trees?—E. H. H., Gardena.

In our issue of August 25th, page 187, we noted that 1000 pounds of poultry would produce daily about 38.9 pounds of fertilizer. Making a close estimate of the weight of your flock, this would give you a general idea as to the amount of fertilizer scattered in the orchard. Fresh poultry droppings contain 56 per cent of water, 1.6 per cent of nitrogen, 1.5 to 2 per cent of phosphoric acid, and .8 to .9 per cent of potash. From this it will be seen that the percentage of potash is low and should be increased. As to the quantity which you should use on your trees, that depends upon soil and sub-soil conditions, so that a definite answer could not be given without examination of the soil.

Warts on Teats of Cow.

Please give method of removing warts from teats of cow.—Subscriber, Waukena.

This question was answered by Mrs. Sherman in the issue of July 7th.

Peaches Not Setting.

Some varieties of my peaches do not set enough fruit. What is the best time to prune trees to secure more fruit? Is it too late in the season now?—S. B., Long Beach.

Some pruning at this time proves profitable, but this late must be practiced with caution, and heavy pruning not indulged in. In any case, it is a little late this season, and we would advise exceptionally light pruning, if any. This will depend, however, upon the condition of the soil. If the ground is dry and the tree has become to a certain extent dormant, pruning might cause starting out of new growth and injure the tree. Light pruning of the tops soon after the fruit is removed, especially on the earlier peaches, will sometimes induce fruiting.

FLYLESS SUMMERTIME.

That summertime need not always be fly-time even beyond the pale of sewered districts is the hope-offering of Professor William B. Herms to the health promoters, bald-headed people and other individuals who have good cause to despise the fly.

Appropos of this subject Prof. Herms, whose anti-mosquito and anti-fly campaigns have made him a prominent figure on the coast, gives out the following statement: "The town that permanently abolishes all open toilets and other conditions of filth ond moisture, such as decomposing refuse heaps, accretions in garbage barrels, etc., will become flyless. House flies cannot come into existence unless they have some such places in which to breed. They seldom travel more than one or two blocks from their place of hatching.

"According to reports received by the State Board of Health it has remained for Lakeport, a summer resort in Lake county, to lead the non-sewered towns of the state in relieving its visitors and inhabitants of fly and odor evils by making the dry-earth toilet system universal and compulsory. There is no doubt that the open toilet vaults are an extreme menace to public health, chiefly due to the fact that common housefly is an

Vetch

A few tons of imported German seed remaining in warehouse at Los Angeles, also at Redlands. Will make close price to clean up.

L. THOMAS MFG. CO., 4123 Wayne St., Dayton, Ohio

abundant carrier of intestinal diseases, such as typhoid fever, dysentery and cholera infantum. These diseases are caused by specific organisms which must be carried in some way from infected matter to the food of human beings, therefore could not be caused alone by hot weather. Warm weather of course is favorable for the breeding of flies which become abundant, and this abundance is often followed by epidemics of certain intestinal diseases where water and milk are found not to be a fault. Not only are flies attracted to the vile contents of open privies but they will breed in this material.

"Odors do not escape from properly operated dry-earth toilets, and flies cannot breed in them. The change of open-vault toilets to the dry-earth system is simple and inexpensive. First fill in the pestilential vault. Put in the place of it any metallic receptacle that is movable and water-tight. A large wash tub with a rope in the handle will answer the purpose. Spread a four-inch layer of dry earth over the bottom of the receptacle and keep the contents covered with fine dirt, sand, or ashes. Large establishments sometimes put a tank on wheels or sled runners, so that the hauling may be done by horses.

"The dry-earth refuse is valuable for fertilizing purposes and will in many instances well repay the labor incident to burying it near fruit trees or depositing it in deep furrows and plowing it under.

SWEET CLOVER.

The A. I. Root Co. of Medina, Ohio, has just issued a little booklet of 100 pages on "The Truth About Sweet Clover," which touches upon its value for honey, as a green manure, as feed for horses and cattle, and also as a valuable plant in the introduction of nitrogen gathering bacteria. The booklet is made up largely from clippings from "Gleanings in Bee Culture" from 1905 to 1910; also from various other agricultural periodicals. The remark is made in the introduction that certain people have an idea that sweet clover is a noxious weed and that its planting should be restrained by law. The book protests against this belief and says: "Our experiment stations have for many years decided that sweet clover is one of the best clovers to plow under for purposes of enriching unfertile or worn out soil." We do not know whether the booklet is sent on request or not, but assume that it is.

PUMPING IRRIGATION.

Many handsome trophies, mainly in silver cups, will be offered for competition at the National Irrigation Exposition, Pueblo, September 19-October 1, this exposition being held in connection with the Eighteenth National Irrigation Congress.

Some of the cups are magnificent in their cost, in their decoration, and design, while others are simpler. All of them attest the great interest in the exposition and in the congress.

D. H. Anderson of Irrigation Age, is offering a $250 silver cup for the best exhibit of pumping machinery.

Irrigationists everywhere are turning to the increased duty of water, the economy of distribution and utilization. There are many portions of the irrigated West where pumping is essential. This is true in Southern California, in the famous Garden City district of Western Kansas, in that portion of Colorado lying east of Colorado Springs, in the state of Washington, and elsewhere. No subject at the Irrigation Exposition at Pueblo will be more eagerly investigated, it is thought, than irrigation by pumping.—R. H. Faxon.

POULTRY SHOW DATES.

North Yakima, Washington, Sept. 26-Oct. 1, 1910. Washington State Fair. John W. Pace, Secretary, Harry H. Collier, Superintendent.

Stockton, Cal., Nov. 8-12, 1910. First Annual Exhibition of the San Joaquin County Poultry Association. Eugene P. Sabin, Secretary, Stockton.

Jerome, Idaho, January 24-28, 1911. Wm. N. Hardwick, Secretary.

WILL START A TOAD FARM.

One million toads are to be bred by Richard Dray, a gardener from Australia and New Zealand, who arrived in New York last week. Mr. Dray has faith in the ability of the common toad to protect plant life from destructive insects, and hopes to convince the farmers that the toad is their friend. He will be the first hoptoad salesman in the world.

"It is amazing," said Mr. Dray, "that farmers know so little about the value of the common toad. I intend to start a Society for the Protection of the Toad.

"The hunger of the toad is prodigious. It has been estimated that one toad will devour in thirty days, 700 cutworms, 1,000 ants, 150 weevils, 140 ground beetles, and 600 myriapods, all harmful to vegetation. The brown tail moth also is eaten in vast numbers.

"A shilling apiece has been paid by English gardeners for full-grown toads. They are better than any artificial method for the destruction of plant-destroying insects. I do not expect a shilling each. Twenty-five cents a hundred would pay a handsome profit."—Review.

Money Making Little Liners

A BEAR STORY.

"Have you ever heard the story of 'Algy and the Bear' "? asked a boy of his father. "It's very short.

"Algy met a bear,
The bear was bulgy,
The bulge was Algy."
—London Daily News.

HER INSOMNIA.

(Scene—The dining room of a house in a Chicago suburb, at 8:30 a.m. A neat but very sleepy-looking maid is arranging the table for breakfast. Mr. and Mrs. Harberson, also very sleepy looking, enter from the hall. Mrs. Harberson sinks into the nearest chair, leans back and closes her eyes. Her husband yawns and opens the morning paper.)

MRS. HARBERSON (drowsily, as some one is heard descending the stairs)— Here she comes, now. You may serve the breakfast, Mary.

(A plump, middle-aged woman appears.)

Harberson (ironically)—Good morning, Cousin Harriet. I hope you slept well?

Mrs. Harberson (sympathetically)—Poor Cousin Harriet! I'm afraid your first night with us wasn't very restful.

Cousin Harriet (with an air of resignation, as they take their places at the table)—No, my dear, it wasn't—far from it. But a victim of insomnia does not expect restful nights.

Harberson (suppressing a yawn)—Nothing like being used to it! But last night—

Cousin Harriet (impressively)—Yes, it has been years and years since I really had a night's sleep. I never close my eyes till one or two o'clock and often not till dawn!

Mrs. Harberson—Well, it's a perfect shame! To-night you must try—

Cousin Harriet—Oh, my dear, I've tried everything—just everything! But nothing does any good! Somebody once told me to imagine that I saw a flock of sheep jumping over a gate and to count them as they jumped; but every once in a while my eyes would go shut, just for an instant; then I'd forget how many I had counted and I'd have to begin all over again. I've tried saying the multiplication table, too, but I never can be sure how many nine times seven are unless I stop to think, and, [illegible] course, you can't go to sleep whe[illegible] you are thinking! And I've tried hot baths and sleeping without a pillow and opening the window and a lunch before retiring and—

Harberson—What did you eat?

Cousin Harriet (helping herself to another roll)—Oh, everything! But it didn't do a bit of good. One night last week I ate a piece of hickory-nut cake and some lobster salad that I found in the icebox and I never closed my eyes the whole night long.

Mrs. Harberson—It might have been a little better if I had put you in the back room. Our spare room is so close to the street.

Cousin Harriet—Yes, when I do happen to drop off, the very slightest noise wakens me. I always sleep with one eye and both ears open. It's a wonder how I manage to exist with the small amount of sleep I get!

Mrs. Harberson (who has been making a constant effort to keep her heavy eyelids from closing)—Yes, one does feel so wretched after losing even one night's sleep! Now, this

AN ACT.

FOR the admission of the State of California into the Union.

Whereas the people of California have presented a constitution and asked admission into the Union, which constitution was submitted to Congress by the President of the United States by message, dated February thirteenth, eighteen hundred and fifty, and which, on due examination, is found to be republican in its form of government. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the State of California shall be one, and is hereby declared to be one, of the United States of America, and admitted into the Union on an equal footing with the original states in all respects whatever. Section 2. And be it further enacted, That until the representatives in Congress shall be apportioned according to an actual enumeration of the inhabitants of the United States, the State of California shall be entitled to two representatives in Congress. Section 3. And be it further enacted, That the said State of California is admitted into the Union upon the express condition that the people of said State, through their legislature or otherwise shall never interfere with the primary disposal of the public lands within its limits, and shall pass no law and do no act whereby the title of the United States to, and right to dispose of, the same shall be impaired or questioned; and that they shall never lay any tax or assessments of any description whatsoever upon the public domain of the United States, and in no case shall non-resident proprietors, who are citizens of the United States, be taxed higher than residents; and that all the navigable waters within the said State shall be common highways, and forever free, as well to the inhabitants of said State as to the citizens of the United States, without any tax, impost or duty therefor: Providing that nothing herein contained shall be construed as recognizing or rejecting the proposition tendered by the people of California as articles of compact in the ordinance adopted by the convention which formed the constitution of that State.—Howell Cobb, Speaker of the House of Representatives. William R. King, President of the Senate pro tempore.

Approved September 9th, 1850, Millard Fillmore.

morning I can hardly hold up my head.

Cousin Harriet (looking keenly at Mrs. Harberson)—Don't tell me you are beginning to be troubled with insomnia? (Turning to Harberson.) And Clarence, too! I declare you both look as though you hadn't slept a wink.

Mrs. Harberson—Oh, no, indeed! Both Clarence and I usually sleep very well. But last night—

Cousin Harriet (mournfully)—You poor child! It will grow on you. That was the way I began; just an occasional bad night. And people are so unsympathetic about insomnia!

Harberson—Nonesense, Cousin Harriet! We haven't got insomnia! It was the fire engines.

Cousin Harriet (puzzled)—The fire engines?

Mrs. Harberson—Of course, no one could expect to sleep last night.

Cousin Harriet (blankly)—I don't see why.

Harberson (leaning forward and looking, all at once, very wide awake)—Do you mean to say, Cousin Harriet, that you didn't know the house and barn across the way burned to the ground last night?

Mrs. Harberson—And that, the street was full of fire engines and yelping dogs and shouting people from 12 o'clock till dawn?

Cousin Harriet—You don't really mean—(Getting up and going to the window.) Impossible! (Looks out, appears slightly confused, but recovers herself.) Well, well! I suppose I must have dozed a little toward morning!—Exchange.

Santa Ana is to establish an agricultural high school.

HOMELESS CHILDREN

Want fathers and mothers. Cultivator readers have taken hundreds of them, and they tell us of mutual happiness and satisfaction.

No home is complete without a child in the house.

Favorable arrangement can be made.

FOR THE ECONOMICAL GIRL.

"Take care of the pennies and the dollars will take care of themselves," is a trite saying, and when a girl has learned to take proper care of her clothes she saves many a dollar, for they not only look better, but last twice as long. If your nice parasol is worn down the seams, sew narrow strips of velvet down each seam and sew three or four rows around the edge; and if the cover is worn, rip off the old cover and cut out one section for a pattern and make a new cover of sateen or any preferred material.

Clean your white shoes with gasoline and let them stand for an hour or two, then wash them with peroxide of hydrogen and place them in the sun. White kid shoes may be colored black with any good dye by applying it with a brush, and when dry, the shoes can be given a coat of black shoe polish.

You can have nice cuff links by buying four pretty buttons and sewing a small cord through the shanks of two of them and then working over the cord with thread to match the buttons, and one may have a pair of links for every shirt waist if desired.

Fine white waists last twice as long if they are rubbed lightly in the washing, and they need very little rubbing if they are put to soak in warm suds in which a little borax is dissolved, as this softens the water and whitens the fabric, and the borax suds is excellent for washing the pretty ginghams and muslins, as the borax helps to keep the color in the goods and there is nothing better than this suds for washing the chamois gloves. After washing them clean through this suds, they should be rinsed through a light suds, so a little of the soap can be left in the kid to keep it soft.

Artificial flowers and straw hats can be made to look like new by dissolving some water color paint of the desired color in gasoline and painting them with a paint brush, and sometimes the addition of new leaves which can be bought for a trifle will give the flowers a fresher appearance. To freshen black hats that are beginning to grow rusty, simply brush them over once or twice with the liquid shoe polish, then leave them to dry. Use the tan polish to freshen tan hats.—M. A. T.

DO NOT LEAVE FOOD AROUND.

If food is left within reach of a patient from one meal to another in hopes that he may become hungry and eat, it will disgust him so with the sight of it that he will not eat anything. Patients have been made to go with insufficient nourishment for days at a time simply because the continuous sight of the food nauseated them. Let the food be brought at meal time without consulting the patient beforehand, as to whether he wants anything or not, and let it be taken away if uneaten at the right time. Never leave soiled dishes around, for the sight of them is unpleasant and disagreeable to a well person, and to a sick person it is simply disgusting. If the sick person can feed himself then let him be alone while eating, but if he must be fed, the person who feeds him must avoid talking.

A HAPPY THOUGHT.

"Let's go to the theater."

"I've nothing to wear."

"Then we'll go to the opera."—Lippincott's Magazine.

OUR BIG FALL CATALOG NO. 100
BRIGHTENS FIVE HUNDRED THOUSAND HOMES

This is probably the most asked for "Book on How to Save Money" and "Reduce High Cost of Living" that has ever been given away, and there is a good reason for it.

FIRST Because it has proven to the buying public that merchandise purchased from a retailer must of necessity have paid four distinct profits, viz: (1) Manufacturer to jobber, (2) jobber to wholesaler, (3) wholesaler to retailer, (4) retailer to consumer.

SECOND Because it has proven to the buying public that the merchandise purchased from the largest and only exclusive mail order house in the West entails only one small profit from **US DIRECT TO YOU, THE CONSUMER.** Therein lies the secret of our success.

OUR EXCEPTIONAL BUYING FACILITIES Enables us to handle merchandise of the highest quality and sell at prices within the reach of everyone at a saving of 25 to 50 per cent over that of the retailer.

IT WILL PAY YOU BIG To buy all of your goods through this catalog, besides the great saving you can make by trading by mail. It is the easiest and most satisfactory way of purchasing goods, therefore, you owe it to yourself as well as to us to send for **OUR BIG FALL CATALOG, ALSO OUR SPECIAL GROCERY CATALOG,** both sent postage prepaid. **THEY COST YOU NOTHING,** but save you money. Our unqualified guarantee "Satisfaction or your money back" is your protection—we take all the risk.

The Wonderful ALADDIN Lamp

Wonderful because it produces a luxurious, soft, white light, excelled only by sunlight. Burns ordinary kerosene or coal oil, the cheapest of all illuminating fuels.

Burns *Less Oil* than Any Other Lamp of Equal Candle Power

Aladdin Lamps are most durable in construction—easiest to take care of—simplest in operation. The light is brighter and easier on the eyes than gas or electricity.

Occulists declare the **Aladdin Gives The Best Artificial Light Known.** Users declare it is not only the best light, but the best **Lamp** known. **There is No Equal.** The Aladdin is superior by test and best by comparison. It appeals to those who want superlative excellence for its own sake—appeals to those who consider economy a first essential. **Odorless, noiseless, simple, safe and clean**—*The Ideal Lamp* for the multitude.

Don't be bamboozled by an imitation. There is **only one Aladdin.** Insist on having it. The name is on every burner.

Hay.

Scott, Magner & Miller says:

Receipts of hay for the past six days have been 6800 tons, being over 1100 tons a day. The accumulation of last week had not yet been worked off when the heavy arrivals of last Monday were added to the burden of the market.

Conditions here have been most satisfactory in everything connected with the situation. The immense amount of hay that has been coming steadily for the last three weeks has blockaded every avenue of outlet, so that it has been the most strenuous time that we have seen for years, all along the line. It has been impossible to realize cost prices out of the hay that has been coming and the consumers, who have anticipated this situation and are taking advantage of it to the fullest extent, have been dictating the prices of the market during this entire blockade.

There has been considerable alfalfa hay arriving, but as these arrivals had been sold to be shipped north, they have not affected the market at all.

There is very little demand for straw, and very little of this article coming in. The ordinary grades of straw will not sell at all. The fact that there is so much cheap hay offering that is being used for bedding, adversely affects the straw market.

Fancy wheat	12.00@12.50
No. 1 wheat or wh and o	9.50@10.50

Cocoanut cake per ton	35.00
Mixed feed, per ton	25.00@26.00
Shorts	26.00@27.00

Deciduous Market

SACRAMENTO, Cal., Sept. 3. 1910.

The following circular of the California Fruit Distribtuors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, September 2, 1910:

Peaches.

Two hundred and thirteen and one-half cars. This last week's shipment has comprised the bulk of the Salway offerings for the present season. There will be a limited number of cars offering next week, but the quantity will certainly be very much less than has been shown for the past week. It is not expected that the movement will be of any considerable volume after Wednesday.

Plums:

Movement of this fruit has been too light during the past week to be worthy of mention, being less than one car.

Pears.

Seventy-three cars. A very considerable falling off is shown in the shipment of this variety of fruit which will show further curtailment during the next seven days. As stated before, our winter pear crop is light and the shipments have now very largely gone forward.

Grapes.

Three hundred and seventeen and three-quarter cars. The Tokay movement is now in full swing and fruit is reported to be in fine condition and of better quality than usual. Growers report as they go over their vineyards that the quantity is even less than expected, and while shipments during the month of September will be of the usual volume, it is expected that the season will end earlier than heretofore. It is not expected that the movement during the next week will be much more than 50 cars per day.

Since our last report weather conditions have been very favorable to the full and perfect development of fruit.

Citrus Market

LOS ANGELES, Sept. 7, 1910.

A slightly easier tone prevails in the orange market and a depressing effect is noticed from the quantities of off sizes, greens, and dry fruit. But with the small number yet to go there is no occasion to be concerned about the market for reasonable prices must prevail.

Lemons show a very firm condition and the few to go will command the top of the market. The storing will not begin for many weeks yet because present prices will induce immediate shipment.

Shipments.

Shipments of citrus fruits since November 1st, 1909: 28,885 cars, of which 24,472 were oranges and 4,413 lemons.

NEW YORK, Friday, Sept. 2.—Nine cars were sold. The market continues strong on good fruit. The weather is clear and favorable.

HOW MANY HENS?

Continued from page 219.

feet high each, scratching pen in front of second story and roosts and nests behind. First story is all dirt floor with wire all around; second story has wire sides above the one-foot high scratching pen with board sides to rear half or roosting and nesting place. Do not like the pen. It is first rate for the hens and saves room, but I am getting too elderly and fleshy to crawl through a door 2 feet high that is close to the ground. I would build about 4 feet deep and 10 long should I build, as birds and pen would be more accessible, and easier to keep clean. Always have a spare pen so one can change at once if anything should be wrong in one of the pens. If a bird gets pecked or bloody, wash off, vaseline, and toss in spare pen for a day or so.

L. V. Peterson, Guerneville.

I don't know how many hens one acre will accommodate as my hens are all on free range. I handle White Minorcas exclusively, and think from 12 to 15 in a pen would be O. K. if you mate them to a good vigorous rooster. This number might be too many for some of the other less active breeds; probably ten would be sufficient for the latter. The size of house is not very important, so long as you don't crowd in too many hens in each house. Would recommend house partly open on side away from prevailing winds, opening to be high enough above level of roosts, so that fowls are not directly exposed in case wind should come from that direction. Cover with wire screen or netting of some sort.

Hemp Culture.

The bluegrass region of Kentucky, in the center of which lies Lexington, raises about 20,000 acres of Cannabis sativa from which hemp is procured. The acreage devoted to hemp in other parts of the United States is very small—perhaps 600 acres around Lincoln, Nebraska, and an equal number in the lower Sacramento Valley in California, with small experimental plantings in Indiana, Pennsylvaia, Wisconsin, Michigan, Minnesota, Iowa, and Arkansas.

Russia produces more for export than all other countries, but Italy, Austria-Hungary, Germany, France, Belgium, Turkey, China, and Japan grow it commercially for fiber.

All the hemp fiber produced in this country is used in American mills, and as increasing quantities are being imported, a market for a larger home production is offered. Therefore, the circular recently issued by the U. S. Department of Agriculture on the Cultivation of Hemp in the United States, in which climate, soil, sowing, harvesting the plant, and methods of preparing the soft gray or yellow bast fiber are described and explained, should prove of interest to farmers in those sections of the country outside of the recognized hemp growing region where soil and climate seem to offer a prospect favorable to its production.

TIME HUNG HEAVY ON HIS HANDS

A Chinese laundryman in Oakland, California, recently had his troubles with a watch that habitually lost time. So he took the timepiece to the nearest watchmaker.

"Watchee no good to Charlie Lee," said he, briefly, pushing it across the counter. "You fixee him, eh?"

"Certainly," said the watchmaker. "What's seems to be the trouble with it?"

"Oh, him too muchee by 'n' by," said Charlie Lee.—Harper's weekly.

Fumigation is in full swing over the entire orange belt.

THE LAYNE PATENTS.

The Layne patent centrifugal pumps and patent well screen advertised in this issue of the Cultivator are things that will interest every one that has irrigation to do. This pump and screens are manufactured by the Layne & Bowler Co., Santa Fe Avenue and Violet Street, Los Angeles. They have a neat ltttle catalogue which will be sent free upon request, if you mention the Cultivator.

CAN YOU SAW AND HAMMER?

If you can, you can fit out your poultry house with 1910 conveniences. Other poultry keepers who work at their regular trade or business make hoppers, ordinary and trap nests, fireless brooders, fresh-air doors and windows, portable fences, and even fresh-air and portable houses, during their spare time, and you can do the same. Probably you have never been told how these conveniences can be built—everyone doesn't know these things—but you now have an opportunity to learn from the builders themselves.

Simple descriptions and 146 illustrations of everything the builders have found "just what the doctor ordered" are contained in a new book **Built and Used by Poultrymen.** This is the only book that tells you how to make these things just as though you were talking face to face with the builders themselves. Mr. Jensen tells you how he built two kinds of fireless brooders (one is shown above), and so on through the *fifteen chapters.* Read their titles and see the large number of subjects treated.

Modern Breeding Houses. Modern Colony Houses. Modern Brooder Houses. Houses for Indoor Brooders. Houses for Males and Small Pens. Adapting Barns for Poultry. Movable Fences and Fencing. Nests and Trap Nests. Brood Coops, Runs and Pens. Modern Fireless Brooders. Hot-Air Brooders. Shipping Day-Old Chicks and Eggs for Hatching. Food Hoppers and Fountains. Methods of Sprouting Oats. Other Useful Devices.

This valuable 100-page book, bound in a handsome colored cover and filled with helpful reading matter and 146 clear illustrations, will be mailed to you for one-half the publishers price, if you accept our **Special Offer.** Act promptly and profit by these new ideas.

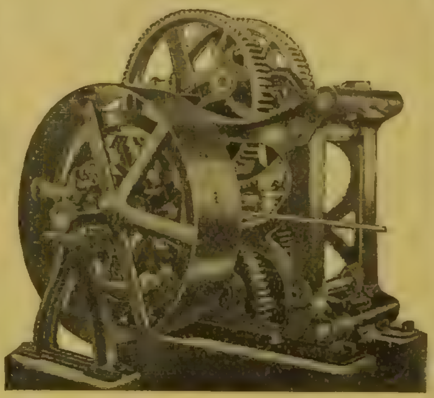
The Smooth Running Pomona Deep Well Pump



RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

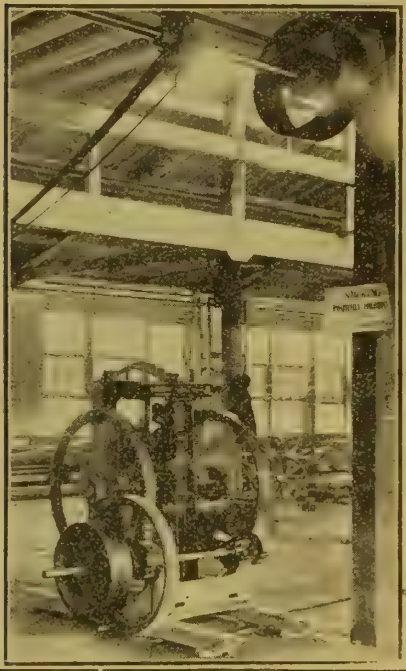
The Luitwieler Non-Pulsating Pumping System



Best For Deep Well and Irrigation Works

Pump Talk Continued:

The cam principle is now universally conceded to be the most perfect mechanism for lifting water from deep wells or against pressure. Luitwieler Pumps are the result of long years of experience and embody the perfection of the cam principle. The mechanism is balanced and all pumps are tested for smoothness of operation before leaving the factory.

The cut shown here is that of one of our 18 inch Double Geared Pumps, being driven by only a ½ inch belt lace. The weight of the revolving parts is 3200 pounds. This test is not possible with any other type of pressure pumping mechanism, not even the much advertised Triplex.

Luitwieler Pumps are in a class by themselves. 32 years of experience in Los Angeles with pumps and irrigation. Send for our catalogue.

One of the State's Greatest Pests--Russian Thistle

Report of Investigations Made in Ventura County by E. O. Essig, Horticultural Commissioner.

This Pest Demands Instant and Effective Work.

IN the year 1905, the State Commissioner of Horticulture of California issued a pamphlet entitled "The Russian Thistle—Its Introduction and Spread in California. With Laws and Measures for Its Control." Among other valuable things, this warning to the farmers was given:

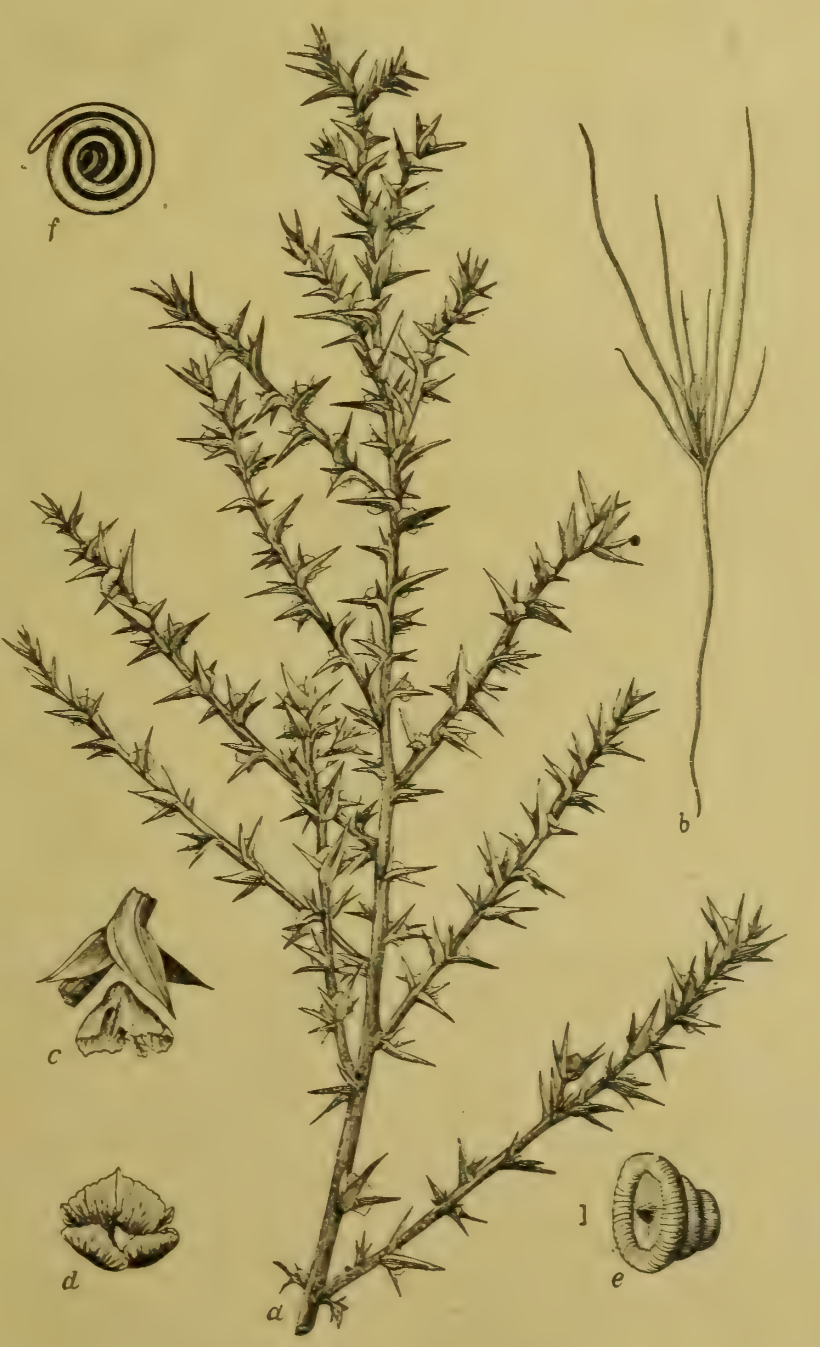
"Warning to Pacific Coast Wheat-Growers.—East of the Rocky Mountains the thistle is already so widely distributed that its continued progress in that region is inevitable. Its advent in California and Idaho, however, is a far more serious matter. The Rocky Mountains present a great natural barrier which the thistle will not easily pass, except by artificial conveyance. With the natural conditions thus favorable to its exclusion, and with a full knowledge of the disastrous nature of the scourge, it is almost criminal to allow it to become established west of the Rockies. To the Pacific Coast Sierra Nevada and Cascade Mountains afford additional protection, but some weed will be sure to find its way over this barrier also, especia if the thistle is allowed to obtain a hold in the Great Basin. In view of these facts, the California wheat-grower should take precautions against the weed, opposing both its direct introduction into California from the plains east of the Rockies and its gradual advance by way of the Great Basin."

This warning, however, came too late to the farmers of Ventura county, for the thistle is known to have existed in the Upper Simi Valley for over ten years. It was probably introduced in grain seed from the Middle States, and has spread from one small infection to various other points.

At the time of its first introduction little heed was given it by the farmers until it forced itself upon them through its destructiveness.

In January, 1910, the County Horticultural Commissioner spent some days in the Simi Valley and at that time an effort was made to acquaint the farmers with the problem which they were facing and to plan the eradication of the weed. In February a warning to the Simi farmers was published in the Ventura Free Press, and in the California Cultivator, stating therein the seriousness of the Russian Thistle and suggesting methods for its control.

Later investigations showed that only a small number of the farmers paid any heed to these suggestions, for thistle was to be found abundantly growing in the fields, orchards, along the fences, private and public roads, and along the railroad. However, the farmers in general expressed their desire to co-operate fully in the work of eradication as planned by the horticultural commissioner. In accordance with these plans I have made a careful inspection of the entire Simi Valley and other hay producing sections in Ventura county, and have obtained from residing farmers who have successfully combated the weed, and from other sources all possible information concerning the control of the pest which is presented in this publication.



RUSSIAN THISTLE—DETAILED FIGURES.

Detailed figures of the Russian Thistle: Fig. a, branch of mature plant, natural size; b, seedling about two weeks after germination, natural size; c, flower detached from the axil and remaining suspended by minute hairs, in the ordinary inverted position on a rolling plant, enlarged three diameters; d, flower viewed from above and in front, showing the calyx lobes connivant into a cone-shaped body, and the large membranaceous spreading wings, enlarged three diameters; e, seed with flower parts removed, enlarged five diameters; f, embryo removed from the seed, enlarged seven diameters.

Description.

The Russian Thistle belongs to what is commonly known as the goosefoot family of plants (Chenopodiaceae) and is closely related to our common pigweed, scientifically known as Amaranthus retroflexus, and to the Eastern tumbleweed. Though it is called Rnussian Thistle and Russian Cactus, because of its spines, it is not a thistle at all, but a tumbleweed, and in Europe is rightly known as the Russian Tumbleweed.

Young Plant.—The young plant appears with two needle-like leaves or cotyledons. Soon other similar leaves appear and the plant begins to stool. The foliage is light green and very tender at this period and is readily eaten by sheep.

The plants grow slowly until dry weather, and usually do not become bothersome until the hay is cut. But in dry seasons if the grain does not get a start the thistle will choke it out completely.

Adult Plant.—The adult plant averages from 1 to 4 feet in height and branches profusely from the single tap-root at the base. The spread often reaches 6 feet, but the more general size averages from 2 to 4 feet. Where three or more plants grow together they assume the general shape of a single plant—a flattened sphere.

The color varies from light-green to a blue-green. The stems and upper leaves are plainly marked with red longitudinal lines. The matured plant turns to a light brown color, and later bleaches to almost white. The branches become stiff and light, allowing the plant to be carried rapidly away with the wind, when detached from the soil. The detachment is usually accomplished by individual branches breaking off at the base, allowing the root to remain in the ground. The largest plants, when dry, will weigh about twenty pounds.

Root consists of a single white tap-root, with many smaller roots coming from it near the tip. When this root is severed the plant dies, thus making it easily killed by cultivation.

Stems branch profusely from a single erect shoot extending up from the root. The leaves are scattered in confusion over the entire plant. At each axil is borne a spiny bract surrounding the blossoms. The spines or bracts remain on the dry plants and give them the characteristics of the thistle, while the leaves fall early. These spines are so abundant and sharp that it is almost impossible to drive horses through a patch of matured thistle. In the Dakotas it has often been necessary to put leather boots on the horses while cutting the grain.

Citrus and Sub-Tropical Fruits

OLIVE PICKLING.

By Mrs. M. E. Sherman.

The following formula for pickling olives has proven of so much value to those who have used it that we have asked Mrs. Sherman to revise and repeat it in the columns of the Cultivator. Mr. C. W. Beers, Horticultural Commissioner for Santa Barbara county, writes that he has had these directions printed and distributed through his office amongst the olive producers. He considers the quality of the pickle produced so satisfactory that he thinks the directions well worth passing along.

* * *

THERE seems to be no way of absolutely testing the olive to find out exactly the amount of bitterness that must be removed each season. It certainly is true that some seasons the olives are made into pickles with much less trouble. After having pickled them for many seasons, I have found the following method the best. I was first given an insight into this matter by a charming Spanish gentleman, a former Governor of California, years ago in Los Angeles. Then ashes from the oak trees were used to furnish the potash to remove the bitterness. As made by these people the olive was delicious. Their success was made by careful attention to little details.

When the olive pit will slip reasonably clear from the meat, it is time to begin to get the barrels or tubs or troughs ready. Everything must be cleaned, scalded, and then finally treated to a dose of lime water to be sure of the containers imparting no foreign taste. The olives are gathered in picking sacks or in tin pails, using care not to bruise them. If there are many to handle it will pay to use a grader for them; if only a few they may be readily graded by hand, separating the larger ones from the smaller ones. Then again if there are many that are not colored, it is better to keep these separate as they do not cut in the same time as more highly colored fruit. A little care in picking to take only the dark fruit saves this color grading.

The lye used for cutting the bitter white juices out of the olive must be of good quality and at least 90 per cent pure. The Greenbanks or the Hercules brand come in ten pound cans and have given us good success. These tins may hold more than is needed, but this strong lye is very useful around the house. It can be used to flush out drains and to mop up floors that are stained.

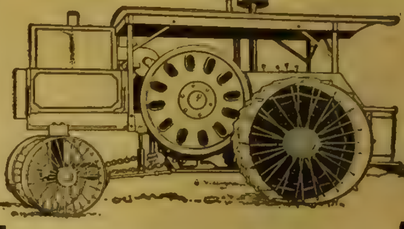
The ordinary five gallon coal oil cans are cut into buckets with handles and are convenient as measures. The lye solution is made weak, about one and one half to two per cent solution. The work is done by leaving the lye on twelve to forty-eight hours and once in a great while comes a season when it is necessary to use a second weak solution of lye. That has happened only once to me in many years, I think because the olives were almost at frost point and as the weather was very cold the lye did not act freely. Strong solutions that will penetrate in a few hours act on the tissue of the olive meats and cause them to soften and spoil.

Weigh one and a half to two pounds of lye and add it to one hundred pounds of water. Eight pounds of water is approximately one gallon. A coal oil can holds five gallons or forty pounds of water. Two and a half cans of water added to one and one half pounds of the lye makes a solution of one and one-half per cent. Then use your two hands as a scoop and add as much common salt as the hands will hold. Mix the salt and lye in the water and when well dissolved pour over the olives. Use enough solution to have it three to four inches deep over the top of the berries. If the olives float, use a piece of clean cheese cloth and then a wooden follower to hold them under. This is usually not necessary, however, as the olives are heavier, if of any size, than this solution. Cover the barrel from the light to save coloring as much as possible. The salt will keep the olives firm while in the lye and also, by its use they are partly salted before they are finished. The slimy bacteria are the only ones that interfere in making olive pickles and these can be controlled by a little salt.

Now comes the critical part of the work, training the eye to know when the cutting has proceeded far enough. I usually put the lye on at noontime and at night draw off a pail full or two and pour it again over the top of the olives to keep the lye from settling to the bottom too much. The next morning take a few olives from the barrels that represent an average of the sizes and ripeness. Cut them open with a knife to the pit and see the line of penetration of the lye. The lye carries a distinct yellow stain with it, while the juices of the olive are milky and the meat whiter when untouched by the lye. The lye must penetrate to within a line's breadth of the pit but not absolutely to it. When this line is reached turn off the lye at once. Perhaps once in ten or twelve years there may come a year when a second weak solution needs to be used. I have overcome this difficulty by warming up a tin of the lye solution and in that way secured better penetration. As long as the lye water is soapy or sleek feeling, there is strength in it. Sometimes the olives are as long as 26 to 48 hours in the solution. When the time comes that the olives are almost cut enough, try them every two hours and do not forget to draw off the solution and pour it back at each examination.

The olives are freshened in water to remove the lye. I throw a handful of salt into this water as it costs little and makes the matter safe. The salt water can be used to flush the drains out or on the asparagus bed to advantage. The exact length of time that it requires to make the pickle depends on the temperature. When the pickling is done in the packinghouse cellars it takes a shorter time than when it is done on the packinghouse porches. The cold air at night makes quite a difference in the temperature of the water. As soon as the lye is out of the olives we begin to salt them, using first three pounds of salt to the hundred pounds of water. Leave this on two days, then draw off and put on a six per cent, then an eight per cent. Some go farther and put on a solution as strong as twelve per cent. We do

Distillate Traction Engine



Double Cylinder 50 H.P.
For Plowing or Hauling will do the work of Twenty-Five Horses
For Pumping or Other Power 50 H. P. Available from Pulley on Engine
Two Speeds Forward, One Back, all on Direct Drive
Easy as an Automobile to Handle. Only Two Levers, One to Drive, One to Control Power Steering Gear.
No Tank Wagon Required.

not like that much salt on ours. The last strength solution of brine should be boiled and cooled, and the olives washed by running cold water over them and the casks intended to hold them should be made thoroughly clean. Examine the olives, and any bruised fruit put into a bucket by itself for immediate use. After that the brine should be watched and in six weeks taken off and boiled again to be sure they are keeping.

The simplest way to make olives keep is to can them. They stand cooking as well as any other fruit and are not at all hurt by it. In a small way use either tin cans or glass jars, wash and put in the berries by hand carefully, then fill the jars with boiled brine. The ten per cent solution is the one used commercially; we use eight. That is a matter of detail. Boil the brine the day before; skim it clean, and after filling the jars stand them up to their tops in a boiler of water and when the water around the olives in the jars has come to a good boil seal them up. We unearthed some over at the packing house that were over ten years old and found them perfectly good.

There are several other ways of fixing olives that make a pleasant change. The salted olives may be pitted and filled with thickened tomato catsup mixed with chopped red peppers. We had a Spanish cook that used to take a clove of garlic, add it to a gallon of olive oil, a little salt and one red pepper. He would then heat this up hot and pour over the olives in the glass jars, then seal them up. Everyone that ate of these olives after they were drained from the oil enjoyed them. The olive oil came into use for salads afterwards.

The olive is liked by the Italians when dried. I confess I never have cared for them, as the bitterness is atent and raises up at the last in mighty power to put a disagreeable taste into the mouth. An old French friend of our makes the olives into candies just by taking them from the brine and pouring over them a heavy syrup made by using a quart of glucose to five pounds of sugar, pouring t over the olives while warm and let-ing them stand in it in open pans or forty-eight hours, then repeating he boiling of the syrup. The minging of the salt and sugar gives a Chinese like confection. After the yrup is well into the olives they can be put into jars and when wanted or use are served by rolling them in oft sugar and putting them on white paper above the stove in the dish ack where they dry out enough to be eaten without daubing the fingers.

trust the time will come when we will make more and more use of olives. They are useful as an addition to duck gravy, and as a garnish nd touch of flavoring to many dishes eems unknown to the average cook. Try making a sandwich by melting cheese in milk and adding chopped olives to it flavoring with a little Worcestershire. Let this harden in a dish and then spread it lightly on one slice of thin rye or graham bread. The other slice of white bread butter lightly and lay on top.—M. E. Sherman.

The Fresno County Fair will open Tuesday, October 3rd and continue he entire week. The 4th will be Governor's Day and it is declared hat Governor Gillette, "Governor" ohnson and "Governor" Bell will e present.

CORRECTIONS.

In the California Cultivator, Vol. 35, page 198, issued September 1st, the statement was made that the Apricot Scale (Eulecanium armeniacum) and also the Frosted Scale (Eulecanium pruinosum) retained their legs and the power of locomotion throughout existence. This is not true for they do resemble Black Scale (Saissetia oleae) in this respect as well as those stated in the article. This however is true in case of the Citrus or Common Brown Scale (Coccus hesperidum) and many other soft forms including the Mealy Bugs, Orthezia insignis, Ceroputa yuccae, etc. —E. O. Essig, Santa Paula.

After the receipt of Mr Essig's correction the following similar and additional one came from Prof. Quayle:—

In Mr. Essig's article in last week's Cultivator the distribution of the Brown Apricot Scale (Eulecanium armeniacum, Craw) is given for the Santa Clara Valley only in this state and is limited in distribution in this country.

As a matter of fact, it has a much wider distribution and occurs in practically every state in the Union and on a wide range of host plants. In this state it occurs throughout the Sacramento and San Joaquin Valleys, from Red Bluff to Bakersfield. It occurs in the Vaca Valley, Napa Valley, Sonoma Valley and Santa Clara Valley. Of these, it is least a pest in the Santa Clara Valley. Here the Black Scale is associated with it and often occurs in greater numbers. The Brown Apricot Scale occurs in greatest abundance and does the most injury in certain sections of the Sacramento and San Joaquin Valleys.

As a matter of scientific interest only, it might be stated that the correct technical name for this insect is now Lecanium corni and the common name that has been proposed is the European Fruit Lecanium.

A little farther along in the same article Mr. Essig states that the Black Scale gradually loses its legs as it grows, whereas the Apricot and Prune Scale does not. In this respect the Black Scale is no different from the other two mentioned, or any other of the unarmoured scales for that matter. Neither do the Apricot or Prune Scales move at will throughout their entire existence. While they retain their legs, like the Black, they are incapable of moving after they are about half grown.—H.J.Quayle.

COLLECTING IN MEXICO.

Prof. A. J. Cook of Claremont informs us that Mr. David L. Crawford, formerly a student in Pomona College, is now in Mexico collecting insects, giving particular attention to those which are injurious to agricultural products. This is Mr. Crawford's second trip to Mexico. He formerly gave much attention to the ravages of the Morales orange maggot. On that trip he found that the pest was prevalent not only in the state of Morales but also in four other states of Mexico. This information is valuable to orange growers and should renew their efforts to prevent bringing to this country that worst pest of the citrus fruit. The expenses of Mr. Crawford's trip are being met by orange growers of Southern California and business men of the city of Los Angeles.

The California State Fair

By M. C. Holman, Manager Northern Office of the California Cultivator.

The biggest peach and the biggest pear,
The biggest pig that was ever there,
The biggest horse that pulls a plow,
The biggest sheep and the biggest cow,
The largest pump to irrigate,
The biggest engine for traction freight,
The prettiest cock that ever crowed,
The sharpest reaper that ever mowed,
Everything best from each and air,
Everything best from earth and air,

WHEN Mr. J. A. Filcher, secretary of the California Agricultural Association began his quest for attractions at the State Fair he looked far and wide into the avenues of production and commerce. He sought to bring into the scope of a hundred acres the richest and best from glorious California. His field was broad and the range of opportunity was limited only by his ability to encompass the magnitude of the undertaking. The State Fair was magnificent in a thousandfold respect. No state produces so varied an assortment of fruits and vegetables. From the tropical gardens of Imperial Valley to the temperate slopes of the Sierras there is a range of production covering well nigh the field of Nature's bounty.

It is a pleasure to walk through the grounds and to look and wonder at the forces which have been at work to make possible such an exhibit. Perfection is everywhere in evidence. In our everyday labors we see and hear of these things scattered throughout the state. One section will be famous for its apples, another for its oranges, another for its raisins. The manufacturing centers claim specialties in particular lines. To see them all without the fair would mean thousands of miles of travel, months of time and tremendous expense. But here they are brought together "all for the price of one admission."

Assembled in one portion of the enclosure are massive buildings, four in number, where may be seen the produce of various counties arranged in most attractive style. Artistic beauty plays an important part in this exhibit, and the artist's handiwork is well illustrated in designs taxing the ingenuity and effort of dozens of trained minds. The capacity of each building is taxed to its utmost to accommodate the thousands of tons of fruits and vegetables. Tall pillars of oranges, great trellises of vines, massive arches formed by the commingling of various kinds of produce, give the appearance of a real fairyland where a magic wand has given the full measure of a rich harvest. The very air is permeated with sweet fragrance. Bands, sequestered beneath heavy foliage add their harmony to the scene, giving a truly wonderful realization of what man, in this favored state, can do.

The County Exhibits.

These in themselves formed a complete exposition. While not all of the counties were represented, enough showed their wealth of produce to inspire pride in every Californian. Alameda county was the only one occupying its own building. So varied are the agricultural and manufacturing products of this county that sufficient space in the main building could not be secured. From apples to gas machines there was a list of booths the simple enumeration of which would occupy a full column in the Cultivator.

Fresno county, always rich in the products of her soil, and ever willing to show herself to best advantage, occupied the center of the main building, and the artistic framework of her covering was beautifully entwined with the vines that have given that section a world-wide reputation.

Among the other counties worthy of special mention were, Glenn, Colusa, Monterey, Tehama, Kern, Placer, Tulare, Sacramento, Merced, Butte and Imperial.

Manufacturers' Building.

Adjoining the main building was the manufacturers' section where the mechanical eye found a feast. The constant hum of activity told of the forces of ingenuity which find daily employment throughout California. For the housewife there were sewing machines in constant operation, rug making from old carpets, self heating irons, together with cereals of various kinds in the process of manufacture into delectable edibles. Dozens of other helpful hints and suggestions delighted the vast throngs which constantly flooded the building. For the farm worker there were pumps and engines, cream separators, plows, harrows and other implements. For the business man on the farm there were card systems, typewriters, and bookkeeping forms for every need. Every section had its full quota of necessities and improvements. This building alone was worth a day's attention.

Poultry.

Housed in a separate building was the best poultry exhibit ever seen at the fair. Birds of all breeds, prize winners superbly groomed, held the admiration of thousands of spectators. From the little Golden Seabright Bantam to the huge Buff Cochin the list contained such birds as delight the eye of the fancy and commercial poultryman. More than 1,400 prize birds were shown. There was also a very complete showing of pigeons. Ducks, geese and turkeys had their special section.

Live Stock and Dairy.

The live stock and dairy industries were exceptionally well represented. There were Shorthorns, Jerseys, Holsteins, Dutch Belted and Guernsey cattle of the very choicest selection from the leading farms of the state

Horses.

Those who admire thoroughbred draft and coach horses were well rewarded for their visit to the fair. Under the supervision of Mr. F. J. Campbell of the Sacramento branch of the Lafayette Stock Farm a splendid showing of Belgians and Percherons was made. Class was everywhere the predominating feature and the beautiful animals disported themselves admirably before the great crowd of 15,000 spectators. The Salvador Stock Farm of Napa showed over twenty prize winners. There were also saddle horses of superior quality. Novelty traps gave excellent display to harness horses. The High School horse "Flash" commanded great admiration by his remarkable display of intelligence.

Special Features.

In the section devoted to pumps there was a complete assortment of makes and sizes. The best displays were made by the Krogh Manufacturing Company of San Francisco, and the Western Gas Engine Company of Los Angeles. Their largest pumps were constantly throwing great streams of water, while the smallest ones gave an interesting il- lustration of the complete range of their usefulness.

The Schmeiser Manufacturing Company of Davis kept its almond huller in constant operation. The Schmeiser derrick and the equalizing hitch drew many interested spectators.

One of the most important of the special features was the exhibit of the University Farm. Here were shown models of the horse and cow, portraying muscles, veins, arteries, viscera, etc. There were also disease germs, property bottled, afflictions of cattle fully illustrated; model dairy houses, methods of testing milk and of determining the presence of tuberculosis in cattle. This formed one of the most valuable exhibits from an educational standpoint to be seen on the grounds. Everything was fully illustrated and even the casual observer could not fail to retain helpful suggestions for the improvement of the farm.

Cowboys.

Easily leading as chief of the outdoor attractions were the bands of cowboys and Indians. Their show while not of the highest order, was calculated to thrill the heart of youth and age. Steer roping, broncho busting, wild horse racing, buffalo riding relay races, overland stage attacks, Indians burning a frontier village at night and the repulse by the soldiers were some of the features which occupied the afternoon an evenings. Added to this was the excellent fireworks display. Set pieces spinning wheels, bombs bursting in to varicolored lights and other interesting features made up this part o the show.

Night Illumination.

It was at night that the real splendor of the fair burst forth. Thousands of incandescent lights transformed the grounds and buildings into a maze of brilliance. From ever building hung festoons of colore globes. The avenues were hung an bordered with varicolored lights an large arc lamps dotted the enclosur at every point of vantage.

Altogether the fair was a worth attraction. Its educational feature stand out prominently as the cardin porpose of the great display. To se better and bigger things, to observ improvements and learn how to enjo and profit by them, to create a d sire to emulate success,—these a the greatest uses of the State Fair.

LIVE STOCK AWARDS.

Owing to the great length of t list of awards it is impossible f the Cultivator to print it in full, b amongst the winners we may no the following:

Dairy Stock.

The Jersey class was especial strong and producers from some the very best herds in the state we exhibitors. Guy H. Miller of Modes was there with cream producers, he has been for many years. He c ried home a liberal list of blue a red ribbons. Of course George Smith showed some of his own bree ing, also some of the matchless importations he has made within the last few months. Other winners were: H. N. Locke Co.; J. B. & J. E. Thorpe; L. J. Dobler, Peacock Stock Farm; and W. J. Hackett.

Another strong line was the Holsteins. The ribbon winners in this class were: University of Nevada; A. W. Morris & Sons; Vina Ranch; and Mills Estate.

A longer string of Guernseys was exhibited than has ever been displayed at the California State Fair before. It goes without saying that some magnificent specimens of the rich colored butter producers were in evidence. The exhibit of Charles G. Lathrop of Stanford University was an especially good one. Another exceptionally fine string was that exhibited by J. H. Mackenzie of Santa Cruz.

A good showing was made of the Dutch Belted, and all from the herds of Mrs. Jennie Strader and U. G. Strader of Ceres.

Beef.

Notwithstanding the Shorthorns are often classed with the general purpose cows, and many are indeed such, the exhibit at the Fair was practically all of the beef strain. In this class the competition was the strongest and gave the judges the hardest work. Among the exhibitors were Mrs. J. H. Glide of Sacramento and the Gibsons of Woodland, the Howard Cattle Co., G. A. Murphy and P. H. Murphy, J. E. Dickerson, and J. W. Goodwin.

In the Red Polls only one exhibitor showed his stock and some of it was exceptionally fine. This exhibitor was R. R. Cartwright of Modesto.

Horses.

The exhibit of horses, both of stock bred in this state and imported, was one of the surprises of the Fair. The Percherons made one of the most classy exhibits. J. Crouch & Sons of Sacramento made a great number of entries and of course as a result carried away a magnificent showing of blue ribbons. McLaughlin Bros. of Columbus, Ohio, made another strong showing. Henry Wheatley; Geo. A., and F. A. Read, Moorpark; C. R. Fillon; and Wm. Bond Newark were other exhibitors, while in the Farm Percheron class were Terry & White, M. Bassett, J. W. Johnson, and Edmond Miller.

Some beautiful specimens were likewise shown in the Belgian open class. Here again J. Crouch & Sons made a strong showing, and they won many ribbons.

Amongst the English Shire open class exhibitors were premium winners from the stables of Henry Wheatley, Geo. A. Smith, J. Crouch & Sons, and J. B. Agnew.

Geo. A. Smith of Corcoran proved a winner with his four-year-old stallion in the English Shire farmers' class. J. B. Agnew of Visalia had some exceptionally fine stock in the same class and won many ribbons.

In Hackneys Messrs. J. Crouch & Sons and Henry Wheatly exhibited and in the Gaited Saddle Horses, F. A. Bridgford, Mrs. John S. Bryan, Pacific Coast Association, Carlton Burke, and Geo. Wallace made strong exhibits.

Some aristocratic German Coach animals were shown by J. Crouch and J. B. Sherwin.

McLaughlin also made a fine showing of French Coachers.

In thoroughbreds the premium winners were Oswald and Dinchi, and Thos. Fox.

Standard Trotters class was a strong one and the exhibitors and winners were McAdrian, F. H. Burke, F. E. Emlay, and Chas. K. Marley.

Exceptionally fine harness animals were shown by F. H. Burke, R. E. L. Leavell, and Wm. Bond.

In the saddle horse class E. A. Bridgford, and Lee C. Deming, were winners.

H. E. Vogel of Fresno, and H. S. Madison won all the ribbons in the class of mules.

Swine.

Probably the favorite breed in swine were the Berkshires. Many herds furnished their best to compete for the ribbons. G. A. Murphy, also P. H. Murphy made exhibits and captured many premiums, as did University of Nevada, A. B. Humphrey, and Gilt Edge Stock Farm.

M. Bassett of Hanford entered into the Poland China class with determination to win and had stock which enabled him to do so. Other winners were P. H. Murphy, and Gilt Edge Stock Farm.

Amongst the winners of other distinct breeds of hogs were Four Oaks Stock Farm, Gilt Edge Stock Farm, G. C. Kreglow, P. H. Murphy and A. G. Humphrey.

Sheep.

The number and quality of sheep exhibited created surprise, one of the strongest classes being the Southdowns: The winners in this class were: Frank Brown, Hubbard Bros., University of Nevada, J. G. S. Hubbard.

The winner of all the ribbons in the Hampshire Down class was University of Nevada.

The Shropshire class was well filled and the premiums were won by Frank Brown of Carlton, Oregon; Bishop Bros., San Ramon; M. E. & G. K. Swingle, Davis. In addition to the open class Shropshires the grade winners were practically the same as in the open class.

Of course Bailey & Sons of San Jose, made their usual showing of Persians and won all premiums in that class.

The above named firm was also winner of all premiums offered in the Angora Goat class in which they made exceptionally strong showing.

All premiums in the Dorset class were won by University of Nevada as also were all in the Cheviot class.

POULTRY AT THE STATE FAIR.

Judging from reports received the State Fair Poultry Show was from every point of view a success—good in the number of entries made and the breeds and varieties staged, good in attendance and interest manifested; good in the prospective business it awakened for the exhibitors. For be it generally known, the poultry show at the State Fair has always proved a good clearance house for those who have exhibited liberally and had good stock to offer. Unlike the regular poultry show, it attracts the general farming community and shows to it the differences between mongrel and pure-blooded stock, while the regular poultry association fixtures are more alluring to the fanciers and experienced breeders catering to the market for breeding stock.

As usual at this season of the year, many of the birds showed evidence of the moult, having not fully attained their full winter plumage. With this exception quality was on the whole very good and most of the classes were well represented. The judging was promptly and satisfactorily done by S. Tyler of Pasadena, Robert J. Venn of Fresno, and Henry Berrar of San Jose.

Among those who were "in the winning" and well represented by strong strings of birds may be mentioned M. Bassett, B. P. Shirk, W. F. Heusel, and George L. Meadows of Hanford; Martha F. Wismer of Oregon; Mr. French of Stockton; Messrs. Fowler and Masterson of Duarte; F. E. Baldwin, San Jose; Lindgren Brothers, Kingsburg; John D. Mercer, Los Angeles; W. S. Sullivan, Agnews, besides many others.

The following is a list of Sweepstake and special prizes:

Martha F. Wismer, largest exhibit in American and Mediterranean classes.

W. S. Sullivan, first for best display of any single variety, not less than 25 specimens, Mrs. D. A. Robertson second.

Martha F. Wismer first best in American class; W. F. Heusel second. C. E. Ross first in Asiatic class, J. W. Blackman second. Lindgren Brothers first in Mediterranean class, F. E. Baldwin second. W. S. Sullivan first in English class, W. H. Ingram second. John D. Mercer first best in Oriental class, Wm. A. French second. Mrs. W. C. Bogan first in Bantam class, J. W. Blackman second.

SPECIALS.

American class.—Mrs. D. A. Robertson, best pen, best male. Clara I. Smith, best female.

Asiatic class.—L. N. Cobbledick & Co., best pen. J. H. Shirk, best male. John Russell, best female.

Mediterranean.—F. E. Baldwin, best pen, best male, best female.

English.—W. H. Ingram, best pen, best male, best female.

Polish.—Mrs. D. A. Robertson, best pair.

Dutch.—C. J. Siegfried, best pair.

French.—Mrs. Emma F. Reid, best pair.

Oriental.—John D. Mercer, best pen, best male, best female.

Game Bantams.—Emory Mitchell, best male, best female.

Oriental Bantams.—J. Will Blackman, best male, best female.

For want of space, The Cultivator finds it impossible to print a list of the individual awards, which will, however, be found in the more full and detailed report to be published in The Rural Californian for October, to which the interested readers' attention is directed.

Dried fruit producers of Tehama county have organized a co-operative marketing association and are discussing the standardizing of dried fruit.

Farmers institute is in session this week in Corning, Tehama county.

POULTRY SHOW DATES.

North Yakima, Washington, Sept. 26-Oct. 1, 1910. Washington State Fair. John W. Pace, Secretary, Harry H. Collier, Superintendent.

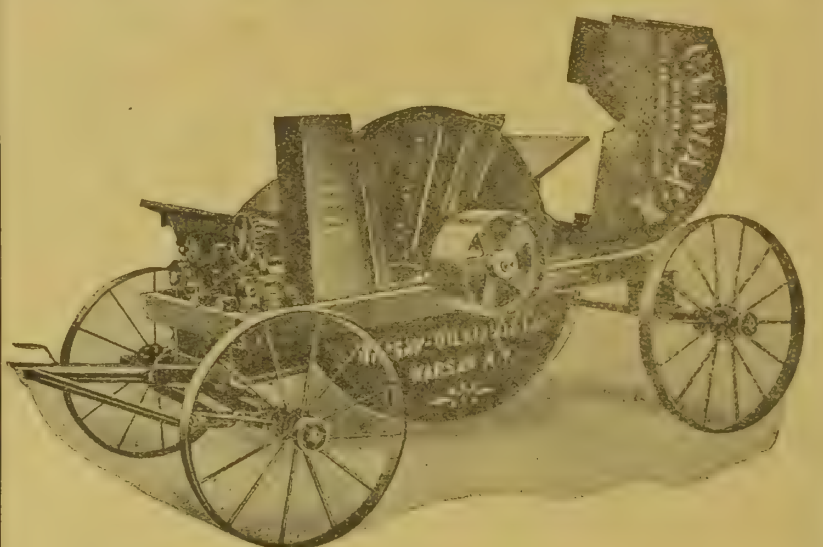
Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 5 to 50 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE DAIRY CALF.

By Mrs. M. E. Sherman.

THE regular skim milk dairy calf is a pitiful object. It reminds one of the Fresh Air Fund child of a large city. The contrast between it and the healthy calf is about the same that is presented by the Fresh Airer and the normal country child. In the East one frequently meets bands of a dozen or more of these little city children with some motherly women on the way to the country for a couple of weeks. The hollow eyes and protruding stomachs all look like the ordinary dairy calf; it means that they lack proper nourishment. The calf needs warm, sweet milk in the summer time if it is to escape this misery. The glad old summer time with its heat and flies does not appeal to the poor calf struggling to live.

Grade Herd.

When the calves are only grades and all the milk goes to market, the kindly way that some men simply kill off the calves as soon as born is better than to raise them to make stunted cows. The calf that is not fed a good growing ration all the time will rarely overcome the early neglect it has suffered. The dairy that has plenty of skim milk finds it profitable to raise the calves to veal age, while in the pure bred herd all good calves are raised, for their value is great.

First Milk.

When the cow drops her calf, as soon as it is dried off, it will take milk. The first milk is important for any young animal, as Nature has put into it a purgative quality that clears up the tar-like secretion of the bowels and starts the stomach into action. It is almost impossible, to start a calf or colt in healthy life without this first milk. The first milk is usually not considered desirable for human beings to use, though there are parts of the country in the Old World where this milk is used to make rich custards for the table. The calf of a mature cow may as well be removed at first; and the little one take his first meal from the pail, and so save the mother's feelings. The heifer with her first calf does better if a little more indulged. They should be left alone until the calf has started a good milk flow and then about the third day the heifer should be regularly milked and the calf fed from the pail. The pressure of the milk in the udder makes the heifer anxious to be relieved and more patient in being milked.

Skim Milk.

After the first week the addition of skim milk a little at a time is begun. At first only a teacupful is added and then more and more until at the end of six weeks the calf receives only skim milk. Now while skim milk is a good food in itself, it is rather diluted and should be strengthened a little rather than to feed more of it. At first a small quantity of bran or middlings is thrown into the pail. Bran is usually the best, but sometimes proves too laxative, then middlings are used and give good results. The use of rolled oats is probably the best of all, but this is too expensive to consider in California. The reason for not continuing a complete diet of skim milk is that it makes the calves rather shapeless individuals. The mistake usually made in feeding skim milk is in giving too great a quantity at one time. Now if one could feed it three or four times a day the calves would need little else; an ordinary grown person can live and do a reasonable amount of work on three quarts of skim milk a day. The food value is there, but they will not feel very full or very lively. When the amount is increased greatly then comes the great distention with all its discomforts. The amount fed a calf must be largely governed by the individual animal; it is safe, however, to feed until the animal's sides are level full but not greatly distended.

Foaming Milk.

The idea that this distention was caused entirely by the foaming of the milk has been very prevalent. While the foam may add a little to the gasses that are distressing the anmal, it rarely produces much discomfort. Foam is largely wind, and the fact that the calf fills up on wind has much to do with its fading away from slow starvation. A day comes when the calf really gets a full feed and then it suffers still more, for "Fam ished people must be slowly nursed and fed by spoonfuls, else they al ways burst." The use of bran [illegible] middlings overcomes largely the pot bellied appearance and it also builds the animals up all over. Where there is a lack of thrift a mixture of grain may prove of benefit. Use two parts of bran or middlings, two parts o rolled barley and one part of oil meal It takes very little of this mixture from a quarter to one pound a day according to the size of the calf, t make a marked improvement in it condition.

Sweet Milk.

The calves should have the ski milk sweet and warm for the firs two months; after that it does n matter so much. If the calves ar

to use turned milk it is better they should have it always a little sour than sour one day and sweet the next. The feeding pails must be kept as clean as possible; they need scalding and scouring as much as the milk cans. The use of bran in the pail largely prevents the calves from sucking each other's ears. They get the mouthful of meal the last thing and work on it until the saliva is dried up in their mouths. Where there are more than a couple of calves to feed it is better to use small stanchions and fasten each calf in place. The amount of milk put into the pail in front of each calf can then be right in quantity for its size. The calves should be left in the stanchions for half an hour after feeding them. They then forget to suck each other's ears. This early use of stanchions tends to break the calves into being handled and they never are as troublesome afterwards.—M. E. Sherman.

SORGHUM FOR LAMBS.

For the past few years alfalfa hay and pasture have been rather expensive rations for sheep or other animals being fitted for the market. They can hardly be fed with profit at the present relative prevailing prices of meat and alfalfa. In order to meet such a condition, various combinations of sorghum in substitution for the more expensive ration, were tested in comparison with alfalfa.

January 18, 1909, four lots of grade Tunis wether lambs, uniform in weight, age, conformation and feeding qualities, were selected, eight to the lot. Each lot was weighed on the three successive days just previous to the experiment; after that once every seven days during the trial and again on the three successive days at the close of the test. The lambs were fed the following rations: Lot 1, sorghum hay and seed; Lot 2, alfalfa hay; Lot 3, alfalfa hay and sorghum hay; Lot 4, sorghum hay.

Each lot received as much feed as was cleaned up without material waste. The waste was not weighed back and the total amount of feed was charged up to the lot receiving it. The following shows the total ration for each lot, total loss or gain, pounds of feed for one pound of gain, total cost of sorghum at cost of production and of alfalfa at $10.00 a ton, and the cost of one pound of gain:

Lot No. 1. Sorghum hay 717 pounds, sorphum seed 407 pounds. Gain was 11 pounds. The feed for one pound of gain was 102 pounds. Cost of the feed was $10.50 or 95.5 cents for each pound of gain.

Lot No. 2. Alfalfa hay, 961 pounds. The gain in this case was 82 pounds. Feed for each pound of gain was 11.7 pounds. Total cost of the feed was $4.81 or 5.86 cents per pound.

Lot No. 3. Combination of alfalfa hay and sorghum, 541 pounds of each. Gain in this case was 74 pounds and 14.6 pounds was required for each pound of gain. Total cost of the feed was $4.19 or 5.65 cents per pound.

Lot No. 4. Entirely of sorghum hay showed a serious loss, 1151 pounds was fed. The loss on the lambs was 49 pounds and the total cost of feed was $3.15.

The combined ration fed to Lot 3. produced the most economical gain, which was nearly equal to the gain of Lot 2. Sorghum hay and seed when fed alone was little more than a maintenance ration, as shown by the results from Lot 1. Sorghum hay alone showed a material loss when fed to Lot 4.

Summary.

1. Under conditions where alfalfa can not be grown to advantage, as on saline soils, when water for irrigation is scant, or following a crop of grain, sorghum may be grown as a forage plant to supplement the usual alfalfa ration.

2. Alfalfa alone produces the greater gain in weight per unit of feed. However, present prices of alfalfa and meat will not leave a very great margin for the profitable feeding of this ration.

3. Sorghum in combination with alfalfa makes the most economical ration, and the gains made are nearly equal to those with alfalfa.

4. Sorghum alone, both hay and grain, is inferior to alfalfa and at best makes little more than a maintenance ration.—F. W. Wilson, University of Arizona Exp. Sta.

COWPOX.

Cowpox is of very little consequence except that sometimes the sores are severe enough to interfere somwhat with milking. It is an infectious trouble and may be communicated from one cow to another by the hands of the milker. For this reason the hands should always be well bathed after milking the infected cow before beginning to milk another. It is also a good plan to bathe the udders of all the cows in an infected herd, whether they have all contracted the disease or not. Use the same wash as recommended below for the infected animals.

The only treatment necessary in cases of cowpox is to bathe the udder several times a day in warm water into which a little carbolic acid has been added. Another good wash is half an ounce of hyposulphite of soda in one pint of water.

If the teats are very sore it may be necessary to use a milking tube for a few days. In any case be as gentle with the operation of milking as possible, so as to cause the least irritation.—Southern Cultivator.

A great many think a hog roots merely for mischief. That is not the case. The animal roots for alkali, which it finds in the soil and which aids him in digestion. Nature helps him out in this way when man is foolis enough to neglect him. In the amount of carbonaceous feed that we feed the hogs, there is too little phosphate for them. Anything that we throw to the hogs, whether lime, bones or oyster shells seem to be greatly relished and seems to be a great help to them in digesting their other feeds, and promoting their general health. Tankage is an excellent feed to prevent the sows and pigs from having an apparent craving for uncommon feeds like bones, old leather and also killing chickens. It also aids them in getting more nutriment out of their other feed by keeping them in a healthy condition. A good plan is to satisfy the craving for "something different" by planting a patch of artichokes, which will give them their fill before putting them on clover or grass.—Rural World.

It is a mistake to be constantly drugging horses unless it is really needful.

Sugar Beet Pulp takes place of green grass as a milk producer. 40c per ton. Los Angeles Sugar Factory.

Deciduous Fruit Culture

FIRE BLIGHT OR PEAR BLIGHT.

THIS disease which is known by a number of names such as "Fire Blight," "Pear Blight," "Twig Blight," "Blossom Blight," "Blight Canker," etc., is one of the most common and destructive diseases of pear trees. It also attacks apples, quinces and a few of the ornamental plants of the apple family. In some sections it also attacks plums and apricots. It is an American disease having been first reported from the highlands of the Hudson river about 1780. So far as is known it does not occur outside of North America. However, in this country it is distributed from the Atlantic to the Pacific and north into the fruit regions of Canada. It is the most dreaded of fruit tree diseases, particularly of the pear. It is distinctly epidemic in its nature appearing suddenly in a locality where it may not again be destructive for ten or fifteen years. Nevertheless it is always to be found every season to a limited extent in any locality, ready when the proper combination of conditions arise to spread rapidly and again work havoc.

The disease is caused by bacteria as has been repeatedly shown by careful investigations and experiments. There is absolutely no question any more as to the cause of pear blight. That these bacteria alone cause the disease is a fact, not a theory and as such is no longer debatable. These bacteria pass the winter in cankers on the body or main limbs of the trees. In the spring the bacteria spread from these cankers into the adjoining healthy bark where they are produced in such abundance that they ooze out in sticky, milky drops. Flies and wasps come to these oozing cankers and become smeared from head to toe with the sticky, milky ooze. This ooze is made up almost entirely of the blight bacteria. These insects then fly away to the opening blossoms which they visit for the nectar or honey leaving some of the bacteria from their feet or mouth parts in the nectar of the blossom. Here the bacteria multiply rapidly, penetrating the tender tissue and kill it causing "Blossom Blight." Bees visit these infected blossoms and spread the bacteria throughout the orchard which may sometimes show blossom blight on practically every spur. This blossom blight is common on both pears and apples and is usually the first evidence of the disease that the grower observes in the spring. The bacteria also ooze from these blighting blossoms from which they are carried by sucking insects such as plant lice to the tips of growing shoots, and "Twig Blight" results. Every grower has seen the growing tips of the pears and apples turn black and wither on the trees. Sometimes sucking insects or the curculio carry the bacteria to young fruits introducing them into the wound which the insect makes, thus giving rise to "Fruit Blight," which is not at all uncommon both in apples and pears. The bacteria work their way down the blighted blossom spur or blighted shoot and spread out into the bark, forming the cankers. These cankers are always marked by a well defined line or crack between the diseased and healthy bark. With the formation of these cankers the seasonal cycle of the disease is complete. The bacteria thus go into winter quarters in these hold-over cankers, becoming active again the next season, providing a source of infection for the spreading of the disease.

This disease is sometimes very abundant and destructive in nursery stock. The source of infection in these cases has been repeatedly located in holdover cankers on old neglected pear and apple trees or wild thorn trees near the nursery. The removal of these trees or of the cankers in them has almost always given immediate relief from the severity of the blight in the nursery stock. The disease is frequently introduced into the nursery stock by bees which visit the stray blossoms on quince or apple trees in the nursery row. From these centers of infection it is spread by plant lice and leaf hoppers to adjoining trees and from these to others thus spreading the epidemic. Mr. V. B. Stewart demonstrated during the summer of 1909 that this disease can be profitably controlled in nursery stock. By a systematic cutting out and disinfecting he was able to save a total of 2317 apple, pear and quince trees which became infected during the season but which were saved by prompt removal of the blighted tips of the shoots. From 130 acres devoted to apple, pear and quince stock he lost only 346 trees during the season, 256 of which were lost from a quince block which was badly infested and many of the trees were beyond saving when he began his work in the spring. By means of an automatic counter he kept a careful record of the number of trees pruned and the number of trees removed.

The secret of success in controlling fire blight is the frequent and systematic removal of all blighted blossom spurs and shoots before the disease can get into the trunk or large limbs of the trees. This means the inspection of the orchard or nursery from one to three times a week, carefully removing the blighted parts and disinfecting the wound wherever a cut is made, with corrosive sublimate, one part in a thousand parts of water. Disinfect the wound. Failure to inspect and remove the blight regularly and frequently means a certain loss of large limbs and often of trees, for the blight may extend into a tree quite rapidly killing long limbs in a few days if not removed. In ordinary seasons one man should be able to handle ten acres of Bartlett pears ten years old by going over the trees once or twice a week. In controlling the disease in nursery stock it will be found exceedingly helpful in preventing the spread of the disease to eradicate the aphis as far as possible. This was very successfully done in one nursery this season by dipping the lice infested shoots into whale oil soap dip, seven pounds to fifty gallons of water.—H. H. Whetzel, Plant Pathologist, N. Y., State College of Agr.

SAVE YOUR
ALFALFA SEED

We continue to warn Farmers that 25 per cent. of their Alfalfa Seed is wasted when the ordinary grain separator is used for threshing.

IT IS VALUABLE

Alfalfa Seed is being imported into this country every year because the Western Farmer does not produce enough seed to supply the demand. With the prevailing high prices of seed you cannot afford to have your seed wasted in threshing. We build the only machine in the world constructed especially for hulling Alfalfa Seed. If your thresherman does not have a "Birdsell" Alfalfa Huller give us his name and address and we will send him our Catalog and you shall have our 1910 and 1911 calendar in colors.

FRUIT GROWN IN ARID REGIONS.

One embarrassment which fruit growers in the West have had to contend with is the lack of definite information as to methods under "our conditions." Books innumerable touching upon Eastern methods which have proved successful may be secured, but until the last few years nothing in regard to arid conditions has been available. Experiment stations and scientists from the Department of Agriculture at Washington have recognized the need and have been working successfully to meet it. It has, however, remained for two horticulturists connected with the experiment station of the state of Colorado to gather together in a 400 page book a fund of information which should be in the library of everyone growing fruit in arid or semiarid regions. The book was written largely with a view to intermountain conditions, and many of the specific examples are taken from Colorado fruit growing sections. Nevertheless the general principles apply in all sections with similar situation from the Rocky Mountains to the Pacific.

The authors are Wendell Paddock, Professor of Horticulture, and Orville B. Whipple, Field Horticulturist, both of the Colorado Agricultural College.

There are 20 pages touching upon the history and development of the fruit industry in Colorado. Location, exposure, soils, irrigation, planting, scientific discussion of orchard plants, study of buds of different varieties of fruits and full discussion of pruning, cover several chapters, especial attention being given to handling of trees under arid conditions and propagation of orchard trees. The chapter on the latter topic deals with an outline of the work, not giving as full detail as a nurseryman would require, but most valuable to the orchardist. Tillage with especial reference to fertilizers and green manure crops is carefully treated. Irrigation, of course, is given prominent place. Picking, packing and marketing, frost protection, pests and their control, are all touched upon.

From this outline it may be seen that the book is a complete manual for the orchardist. It is illustrated with nearly 100 line and half tone engravings. In givng an idea of the march of progress of the whole western country, the short historical sketch in the beginning of the book refers to a speech by Daniel Webster in the United States Senate showing Senator Webster's opinion of the West and doubtless that of many others of that early day. The extract of his speech follows:

"It was in 1838. A measure was before Congress to establish a post-route from Independence, Mo., to the mouth of the Columbia River. During the discussion, Daniel Webster, on the floor of the Senate, opposed it and closed his speech as follows: 'What do we want with this vast worthless area? This region of savages and wild beasts, of deserts, shifting sands and whirlwinds of dust, of cactus and prairie dogs? To what use could we ever hope to put these great deserts, or those endless mountain ranges, impregnable, and covered to their very base with eternal snow? What can we ever hope to do with the western coast, a coast of 3000 miles, rockbound, cheerless, uninviting, and not a harbor on it? What use have we for such a country? Mr. President, I will never vote one cent from the public treasury to place the Pacific Coast one inch nearer to Boston than it now is.'"

The book is published by Macmillan & Co., N. Y., or will be secured by the Cultivator Company if desired.

EVAPORATED APPLES.

The capital invested in the production of evaporated apples is large, and the industry affords opportunity for remunerative employment in rural districts devoid of other manufactories and in the suburbs of large towns in the orchard area. The existence of the evaporating plants adds greatly to the value of the fruit farms, offering a steady market and reducing the waste and loss from slightly imperfect fruit to a minimum. Formerly a severe gale of wind near packing time entailed heavy loss upon the fruit grower. Today the large, mature, but slightly bruised apples are immediately pared and dried for the market. The best and largest apples are thus saved and the orchardist is remunerated. The evaporators are competitors for orchard products with all the buyers of green fruit, purchasing whole orchards, evaporating the large apples and devoting the small ones to other purposes. Most of the apples are sliced in rings across the core, which has been removed in the paring process. In some cases choice fruit is quartered or dried whole for special orders. The best sorted fruit is used in both processes and the fruit is a product sought by the best houses in the country.

The inventive skill displayed in machinery for the handling of apples for evaporation is marvelous. Most of the "intelligent" machines for handling apples are the invention of men engaged in evaporators and who have had practical knowledge of the requirements. A machine that puts an apple on its stem end before slicing may be termed "intelligent" without serious violation of correct speech. The end of invention has not been reached. Handling by machines has insured the utmost accuracy and cleanliness. Evaporated apples are clean and sweet, with a rich fruit aroma that becomes fully evident upon proper cooking.—Green's Fruit Grower.

SHY AT BOOKKEEPING.

Must the farmer always be frightened at the sight of the big account books seen in the stores?

The farmer knows that he has no time for any such elaborate business system in his home, even if he has a desk and a little room he calls an office.

Bookkeeping is essential to modern farming; but it is not the intricate bookkeeping of the manufacturer or of the railroad office.

The farmer must have bookkeeping of his own, and there are a number of these simpler methods of bookkeeping at which he need not shy. It may even be advisable for him to adopt any sort of bookkeeping which he finds and use as much or as little as he sees fit.

The point is that some bookkeeping is essential to the most profitable farming.—Spokesman Review.

A GRAPE VINE 142 YEARS OLD.

A London paper of August 6th states that the famous grape vine at Hampton Court Palace, near London, which is 142 years old, has at the present time over two hundred fine clusters of grapes maturing. It may be added for the information of our growers that this celebrated vine is under glass.

Canvas Goods

IN no country in the world is Canvas used to a greater extent or to better advantage than in California.

We handle the best—Living, Lemon Curing and Fumigating Tents, Irrigating Hose, Picking Sheets, Fruit Picking Bags, Stack Covers, Tarpaulins, Canvas, Khaki and Army Duck Suits, etc.

NOW—
the Time
to Plant
Strawberries

Growers all over the country report the shortest strawberry plant crop ever known—this means high prices for fruit next year. My hardy Northern Grown Plants are demanded throughout California. Our climate and dormant season give my plants unequalled vitality, energy and bearing qualities. One of many valued testimonials from large Southern growers: "*We have been buying plants from you for the past 16 or 18 years and have always found them pure and true to name, large and well rooted*. Write today, special prices, free catalogue.

We All Have Our Troubles.

California producers have doubtless felt that the situation confronting them is more difficult than most others have to face. The great distances to market, the more perfect organization of buyers, and, excepting in one or two lines, the less general organization of the growers, produce discouraging conditions.

Mr. Edward Berwick of Pacific Grove, traveling in England, sends The Cultivator a clipping from the London Daily Telegraph, a communication from "A Fruit Grower" who raises the same point which is troubling California producers. He says:

"It is indeed surprising that such choice and wholesome fruit as the strawberry should seemingly be treated with so much contempt, for the general price obtained in all towns alike was 4d, 5d, or 6d per 5-lb. basket of strawberries, including the basket.

"What remained after all expenses had been deducted was repayment for the grower's trouble, which he had taken for a whole year, and for the support of his household for another. Yet many growers here received, instead of a checque from their agent, a bill from the railway company for the charge on the carriage of the strawberries to agents or tradesmen in London and other towns, who were unable to sell at a price which would cover expenses. I have a return from one of my agents amounting to 2d. Out of that the picker has to be paid 1½d per basket, and the outlay on the basket, a penny, to say nothing of other expenses and the fruit-grower's living.

"In England fruit appears to be very indifferently appreciated, seeing that thousands of baskets of strawberries are sold to the public at 4d per basket, while thousands have to be destroyed for want of reasonable prices.

"The railway companies are much more lenient to their foreign neighbors than to their own countrymen, for little allowance is made in the charge on carriage of quantities, and conveniences are very limited for fruit sent from this district."

The above sounds very natural from the American standpoint.

Importing Agricultural Products.

The United States imports between five and six hundred millions of dollars worth of agricultural products annually. About half of these come into competition with productions of this country. Under this class are such items as sugar, tobacco, olive oil, raisins, prunes and other dried fruits, hay, skins, and some others. The other half is made up of silks, coffee, tea, certain fibers, bananas, etc. It is astonishing that fifty per cent of our imports are of an agricultural nature. As to the one item of olive oil, County Statistician Robertson of Fresno, reports that this country imported in 1908 approximately 65,000 barrels, possibly not a great amount considering the magnitude of our country, but when one thinks of the wealth and attractiveness which would be added by the planting of orchards in our valleys to produce that amount of oil, we get a faint intimation of the meaning to this state and to every other state in the Union if we could produce these goods now shipped from across the ocean. Some fruit growers have felt that it is unwise for California promotion bodies to induce people to come here until a better market is secured for our present output, but if our growers will produce a high grade article and market it on a businesslike basis, there is no reason why California should not furnish its quota of these products now imported, and we do not believe the prosperity of anyone now engaged in the fruit industry would be lessened thereby.

State Fair.

Measured by attendance California's State Fair this year reached the high water mark. Several spectacular features were run in connection which aroused much enthusiasm and secured the attendance of people from all sections of the state. San Francisco was particularly in evidence on Tuesday during the "San Francisco—1915" day.

Agriculturally the showing was fully up to any past exhibits in this state, but the greater attention given to spectacular features is somewhat disappointing to the taxpayers who wish to see the appropriation given for the state fair used to advance the legitimate agricultural interests of the state. But we assume the management has a pride in bringing the institution up to the point of being as nearly self supporting as possible, and suppose this is the excuse for the excess of flying machines, high divers, and similar attractions. It seems to take that class of entertainment to bring out the crowd which swells the gate receipts.

Extra Session.

The extra session of the state legislature convened, remained in session for a few days and adjourned, having accomplished the work for which it was called together. This was to submit to the people the proposition of bonding the state for five million dollars for the world's fair hoped to be secured for San Francisco in 1915; also another amendment permitting the city and county of San Francisco to bond itself for five million dollars for the same purpose.

Assuming that both these measures will be approved by the people, it will give the management of the world's fair a total of seventeen and a half million dollars, seven and a half million having been secured already by the citizens of San Francisco. New Orleans, which is a competitor with San Francisco for the honor of recognition by congress, has pledged herself to gather together ten millions. If there is any advantage in figures San Francisco should have a fighting chance.

The San Joaquin county highway commission is being severely criticised, the claim being made that the construction of roads authorized under the recent bond issue of $1,890,000 is being pushed too hastily and that this will result in faulty work. The objectors maintain that instead of 200 miles of roads as contemplated under the bond issue, they would rather see 100 miles better built. On the other hand the Los Angeles county commission is in hot water because it is charged that it is too slow and that its delays are causing great loss. We doubt not both counties will ultimately have greatly improved road systems, but it goes without saying that such improvements should be watched by the people who are most vitally concerned.

Overproduction.

Estimates are being made as to the coming citrus fruit crop of the state and many claim it will exceed 50,000 cars. The present year's output, including Central and Northern California, will be but slightly over 30,000 cars. The timid ones are beginning to inquire what will be done with this immense output. Admitting for the sake of argument that it will be as big as anticipated—which the more conservative growers deny—it is a safe proposition that if all will keep their heads and let the fruit be properly distributed through the twelve months, even 50,000 cars will go at a profit to every grower. It goes without saying that indifferent fruit should be made into fertilizer or other waste products rather than to pay freight on it across the country and depress the market for high grade fruit. If closer estimates made a few weeks later show the preliminary estimate to be reasonably correct, it must be admitted that great care must be used in handling off-quality fruit. Good fruit almost invariably commands full price, but the lowest grade in a sense fixes values, and in sufficient quantity prove a disaster. From present indications, the coming crop will be of highest quality.

More Co-operation.

We note that the citrus growers of Redlands have formed the Redlands Fruit Growers' Protective Association for the purpose of inducing packers to adopt a uniform system of reports and bookkeeping. The fifteen directors are representative orange growers. They expect to keep oversight of the oranges after they leave the orchards and are in the hands of the packers. In a sense this is to be a clearing house with an auditor to investigate books of the packers and to insure a square deal for the 300 growers who make up the organization. This is doubtless a move in the right direction, but it seems to us that it is a step still further in advance for the growers to hold full possession of their fruit until it is actually sold, as is done in the exchange.

The California Fruit Distributors are taking a wise step to increase the demand for one of California's products which it handles. It is printing hangers, the principal feature of which is two bunches of Tokay grapes in the natural colors. In the background are vineyard and home scenes typical of California's hillsides. Given on the face of the hanger is a list of the members. It is most attractively printed and we believe matter of this kind will greatly help to increase the demand for California fruits.

We have a letter from Prof. Anderson stating that preparations are being made for an exceptionally good program for Farmers Week to be held at Davis the week beginning October 10. The Cultivator will give in a short time an outline of it or possibly the full program. Farmers who can so shape their work as to attend these meetings should surely do so. The advantages of attendance are not confined to listening to valuable papers and addresses nor even to discussions upon them, for the farm affords visible examples of the work done.

Agricultural News Notes of the Pacific Coast

Northern California

The Eureka Fair is being held this week.

The Feather shows the lowest water for thirty years.

Alturas, Modoc county, is planning for a farmers institute.

Pear picking is all finished at Ukiah, Mendocino county.

The Farmers Union of Chico made an exhibit at the State Fair.

Up to September 1st Vacaville shipped 885 cars of fresh fruits.

Corn is being raised at Biggs, Butte county, without irrigation.

Ferndale, Humboldt county, closed a successful fair last Saturday night.

Thousands of pickers are now busy in the hop fields pulling the blossoms.

The Armsby Cannery at Yuba City, Sutter county, is running full handed.

Many cherry trees of Placer county are prematurely dropping their [illegible]s.

One hatchery at Petaluma has forty five-hundred-egg-size incubators in operation.

Some Eldorado county fruit growing sections report frosts on September 3rd.

The largest pear orchard in California is in Yolo county. It has 23,000 trees.

Oroville, Butte county, hopes to see a pre-cooling plant established there soon.

The Driving Club of Ukiah, Mendocino county, will hold a meet on September 17th.

Petaluma Grange is urging the establishing of an agricultural course in the high school.

Sacramento Valley Sugar Company is slicing beets day and night. The run will last about 40 days.

Some Sutter county producers have sold Thompson Seedless raisins as high as six cents per pound.

Horticultural Commissioner Newcomb of Sonoma county urges final spraying of apples for codling moth.

A poultry producer at Healdsburg, Sonoma county, is shipping some exceptionally fine stock to the Hawaiian Islands.

Oroville, Butte county, shipped five cars of dried peaches in one day. It brought the producers five cents a pound.

A new peach produced by Luther Burbank, said to be a cross between the Crawford and the Muir, is declared to be a wonder.

Notwithstanding canneries are in operation in Yuba City and Marysville that section has shipped much fruit to outside canneries.

Wine grape growers at Gridley, Butte county, have pooled their grapes which aggregate about 1400 tons. Picking began last week.

Fruit growers at Red Bluff, Tehama county, are taking steps to protect fruit labels adopted by them which certain shippers are appropriating.

Forest fires in Calaveras county destroyed the power lines so that the current was cut off, preventing the running of cars on many streets in San Francisco.

Central California

Twenty or more cars of apples are shipped daily from Watsonville.

The grain threshing season in San Benito county will extend well into October.

The Watsonville Pajaronian reports remarkable result secured from spraying.

A new packing house is soon to be constructed at Turlock by the Earl Fruit Company.

It is declared that many olive trees will be set in the San Joaquin Valley next spring.

Many grain growers near Hollister are selling barley, prices ranging from 95 cents to $1.00.

The Selma Cannery Co. has finished its year's run, the season having lasted about sixty days.

Stanislaus county vineyard owners are seriously considering the pulling out of wine grape vineyards.

A dairyman at San Jose was arrested last week because of disposing of milk reported below the standard.

Offerings of 3⅝ and 3¾ cents have been made to muscat raisin producers at Hanford, Kings county.

Hollister, San Benito county, reports shortage of threshing machines to harvest the big grain crops in time.

The directors of the Turlock Irrigation District arranged an excursion to the headwaters of the system last week.

Reports from market centers indicate a shortage of the world's dried fruit and that raisins are being held very firm.

Stockton shippers report shortage of hay storage at Coast points and refuse to attempt to deliver either hay or grain.

The large seed companies having lands in the Santa Clara Valley are using steam plows to prepare the ground for next season.

Salinas Valley grain warehouses are filled to overflowing with grain and a lowering in price is noted caused by some forced sales.

Estimates of the output of oranges from Tulare county show full crop and of excellent quality. Present indications are for early ripening.

The directors of the Turlock Irrigation District have opened a campaign on Russian thistle and Johnson grass along the canal right-of-way.

The forest fires in the mountains near Porterville have been brought under control and it is thought the loss will not aggregate more than $100,000.

The management of the Apple Annual at Watsonville to be held in October says that there are 27 carloads of fruit already entered. This will exceed the exhibit at Spokane last year.

The Raisin Day Campaign Committee has reports from some Eastern sections that advertising posters placed before the last Raisin Day are still calling attention to the good points of the San Joaquin Valley raisins.

Southern California

Bean cutting is practically finished.

Corona will grow beets for the new Anaheim factory.

Mountain streams are reported to be the lowest for many years.

Many negro cotton pickers are being brought into the Imperial Valley.

The California Date Co. at Heber, Imperial county, has fine dates ripening on its ranch.

Santa Ana, Orange county, has just purchased one of Ventura county's big bean threshers.

Apple growers of the Yucaipe Valley will make an exhibit at the Watsonville Apple Show.

It is estimated that the shortage of lima beans this year will be not far from 15 per cent.

The Forestry Service has a corps of men in the San Jacinto mountains gathering pine cones.

One ranch in the Antelope Valley disposed of 700 steers from its range during the past year.

The San Bernardino county horticultural commission has started a war on Johnson grass.

The new sugar factory at Anaheim estimates an annual output of 20,000 tons of granulated sugar.

It is reported that most of the cotton grown in the Imperial Valley will be shipped to mills in Japan.

The Los Angeles County Bee-Keepers Club held a meeting in the city of Los Angeles last Saturday.

The directors of the Rivera Fruit Association have planned to build an addition to their packing house.

Many high schools of Southern California will start their first term of agricultural instruction this fall.

The cannery at Hemet, Riverside Co. is closed and is now making daily shipments of carlots to Eastern points.

Fruit growers of the Mt. Vernon section, San Bernardino county, are planning a new packing house and cannery.

The bean growers association has held a meeting and it is understood the starting price on limas will be four cents per pound.

The fruit growers of San Fernando, Los Angeles county, are in arms over the dilatory tactics of the county horticultural commission.

Farmers at Coachella, Riverside county, have organized an advisory committee to study soil conditions and suggest methods of handling.

It has been reported that it is possible a shortage may be suffered by water users under the Laguna Dam in the Colorado river because of filling in of silt.

A new orange shippers association has been formed at Redlands under the name of Gold Nugget Orange Association. Its packing house will be located at Bryn Mawr.

The annual meeting of the Indian Hill Citrus Growers Association, recently held at Claremont, listened to reports showing that the shipments of oranges during the past year aggregated 471 cars.

The Coast

Arizona has an alfalfa acreage of 65,000.

The Oregon State Fair is being held at Salem this week.

One orchard of 1000 acres has been planted at Albany, Oregon.

Grants Pass, Oregon is shipping a carload of watermelons daily.

The Interstate Fair is to be held at Spokane, Washington, October 3-9.

Portland is planning for a big apple show November 30 to December 2.

Late potatoes near Portland, Oregon, have been seriously damaged by the drouth.

Severe windstorms have blown off many unripe prunes in Clarke county, Washington.

The Washington State Fair is to be held at North Yakima, September 25th to October 1st.

There are planted in the Salt River Valley, Arizona, over 1250 acres of citrus fruits.

Hundreds of acres of potatoes were ruined in western Oregon by killing frosts on August 25th.

Stubble catching fire from the engine destroyed an alfalfa hulling outfit at Yuma last week.

Extensive rains are covering the Northwest and bringing the great fires under complete control.

With the short labor supply and big crop peach growers at Parker, Washington, lost much fruit.

The market at Seattle, Oregon, is glutted with the greatest quantity of peaches ever seen on that market.

The first shipment of a carload of honey into Spokane was on August 30th this year. It sold at $3.50 per case.

Many irrigation systems were put out of commission by the recent forest fires sweeping over the Northwest.

Alfalfa dropped two dollars per ton last week at Boise, Idaho, and is now selling there at $10 per ton baled.

There are 20,000 acres of rich land taken by Johnson grass near the head of the Verde and Salt rivers in Arizona.

Agents of the War Department are in Portland seeking bids on 10,000 tons of oats and 10,000 tons of hay for shipment to Manila.

An election is to be called at Le Grande, Oregon, to determine as to the making of an irrigation district of 40,000 acres of land lying near the city.

The Department of Agriculture will urge the experiment station service to make extensive exhibits at the dry farming congress at Spokane October 3-6.

The Northern Pacific Railway is again receiving fruit for shipment. During the great fires it refused consignments because of impossibility of getting trains through.

The government has shipped a large number of pure bred Shorthorns and Herefords secured in Nebraska to the Indians on the Klamath Indian reservation in Oregon.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma
Germain Seed & Plant Co.,
Distributing Agents for

Profit in the Poultry Yard

THE GUINEA HEN.

By Professor M. E. Jaffa.

FOR some years it seemed as if the guinea fowl were destined to disappear from American soil. One could travel for miles over lands devoted to the raising of all kinds of poultry without coming across a single bird of this variety. Little by little, however, the tide seems to be turning and little by little people are beginning to realize that there is a definite place and a definite mission for the once despised guinea hen.

The prejudice against her was not unfounded. She is certainly, by nature, an undomestic, wandering bird with a loud, harsh cry that does not serve to win admiration. But even this disagreeable trait has been turned to good account, by those wise enough to make use of it. She is really a valuable bird to have in countries where hawks or marauders of any kind are apt to visit the poultry yard. Her cry serves to frighten away the menacing party or to arouse the sleeping family. And after all, it is really not more disagreeable than that of ducks or geese.

Another virtue of the guinea hen, if such it may be called, other than serving as a "watch dog" for the poultry yard, is that she will eat large numbers of insects, when allowed to range, and will thus help to free the farm from many pests. She also feeds on weed seeds and helps the farmer in his efforts to eradicate this other enemy to his crops. In many cases it has been found well worth while to keep a few guinea fowl on the farm, for these purposes only. But they may also be reared for profit as other poultry are, in connection with these other unique advantages.

A demand for guinea fowls, in some markets, has been gradually growing from year to year. This has been caused, probably, by the increased strictness of the game laws, which prevent people who are fond of that kind of food from enjoying it at all times, as they would like. A good substitute for game has been found in the guinea fowl, which tastes much like pheasant, partridge or quail. This has long been recognized in Europe, where they have for many years been prized as table birds. Indeed, in some places on the Continent both the bird itself and the eggs bring better prices than can be had from chickens. The eggs are smaller than hen's eggs, but are said to have a finer flavor. It would probably be quite possible, with a little effort on the part of those who wish to keep these fowls, for the purposes mentioned, to create an appreciation and demand for them in their own local markets.

The best plan to follow in installing the guinea fowl on the farm is to set the eggs under an ordinary hen. If possible, another hen should be set, on her own eggs, about a week later, in order to bring out two broods at the same time, the period of incubation being that much longer for the guinea eggs. The broods should then be divided between the two mothers and the little guinea babies will learn obedience and gentle ways by imitating the little chicks. In this way their wild habits can be modified and they can be taught to roost at home, before they are given their liberty.

The newly hatched guinea chicks are very small and unusually active and a fine netting is necessary to enclose and cover the yard, as they can both fly high and squeeze through an inch opening. They must be closely watched at first, else they will get lost. Turkeys may be used for hatching these birds and can cover eighteen eggs.

Guinea chicks seem to need food every few hours. A diet of stale bread, chopped egg, millet seed and sour milk or cottage cheese is recommended by those who have had the most experience. They should be fed almost immediately after hatching, not being able to stand the fast that other chicks can. Later, chopped lean meat and onion and greens may be given. After the first week or two they may roam with the mother hen. No matter how much good feed there may be on the range they should always be fed regularly in the poultry yard at night, so as to teach them to come home to roost. They should not be hatched later than July in regions where the winter climate is severe, as they do not resist the cold very well.

In the wild state guinea fowls tend to mate and therefore it is necessary to keep a large number of male birds in proportion to the hens. Three or four hens may be kept with one cock if the eggs are to be used for hatching, but if they are being used for the table only, the number of hens may be increased. Under proper conditions the fertility percentage of the eggs is very high, and this, together with the fact that the birds are not very susceptible to disease, renders their rearing satisfactory from the point of view of probable loss.

The best age for marketing guinea fowls is from five to eight months, although there is also considerable demand for broilers weighing from one-half pound to a pound. C. F. Langworthy states that one fashionable hotel in New York used 3,000 of these birds between January and April, 1905. He also states that they are usually sold undrawn, and often unplucked, as is the case with game, their handsome plumage probably adding to their attractiveness. Connoisseurs consider that the finest flavored meat is obtained from crosses between the white and the pearl strains.

The sex of the guinea fowl is determined by its cry. The hen utters a two-syllable cry, described by different people as resembling the word "buckwheat, buckwheat," or good luck, good luck," or even "pot rack, pot rack." She calls out frequently The male bird, on the other hand, utters his cry very seldom, and it is a harsh one-syllabled sound like "click!" One is sure to hear it if by accident he passes the nest where the hen is being protected during her laying or setting. He is a very devoted and gallant bird and always bears his share in the work of protecting and rearing the young brood

Guinea fowl are hardy and inexpensive to rear. They are great foragers and find nearly all the food they require as adults. They are not subject to disease, and require little in the way of housing. They much pre

fer to roost in trees, and although many breeders keep them penned until they begin to lay, they do not require houses for protection, except in the most severe climates, and are apt to do better when given their freedom.—San Jose Mercury.

THE MARKETING OF EGGS.

From a discussion of this subject by A. G. Phillips in a bulletin of the Kansas Station the following facts are drawn:

The demand for eggs seems practically unlimited, more especially for the better grades. The growth of the storage industry has tended to equalize prices by increasing the demand in summer when fresh eggs are plentiful and supplying the deficiency in winter when fresh eggs are scarce. Since the demand is greatest for the best grades, it seems obvious that a little more attention to details will result in a profit amply repaying the extra time and labor involved.

It is not the purpose here to enter into any discussion of the ways of increasing the production of eggs, but simply to point out the possibilities of profit as a result of extra care in handling and marketing the eggs now produced; the extra profit is to be made by obtaining the top retail price, and, as consumers become acquainted with the product, by obtaining a premium of from 1 to 5 cents per dozen over the regular price paid for ordinary eggs.

In order to obtain top prices for eggs, they must be uniform in size, uniform in color, and uniform in quality. The uniformity in color is not always important and depends on the market; uniformity in size excludes small eggs and unusually large ones as well; while uniformity in quality calls for absolutely clean eggs that have been gathered promptly after being laid, kept under the best possible conditions, and marketed not more than three or four days after they are laid. It should also be noted that only eggs with firm strong shells should be marketed. One thin shelled egg may not only prove a total loss but may also soil half a dozen others.

In order that eggs may be clean, it is necessary to provide clean nests for the hens to lay in. The eggs should be gathered at least once a day and oftener in warm weather. The eggs should be kept in a clean, dry, cool place. Any small or dirty eggs should be used at home; a dirty egg used at once is as good as any, but it will not keep as well and will spoil the sale of clean eggs. Never put in an egg that is not known to be absolutely fresh.

The time of marketing will depend on local conditions, but should be as often as once a week at any time of the year and at least twice or three times a week in summer. In cases where it is impossible for a farmer to take his eggs himself as often as that, he can arrange with a neighbor to take the eggs on alternate marketing days.

The methods of selling the eggs will depend on the distance from the market, the number of eggs to be disposed of, and other conditions that will vary in different places. Where it can be done in connection with the sale of other produce, such as dairy products, the most profit can usually be made by selling direct to the consumer. In such case it will probably pay to put the eggs either in plain cartons or in cartons which have the name of the farm printed on them. The plain cartons can be bought for 60 cents a hundred, or perhaps for less in large quantities; when printed, of course, the cost would be greater, but it would probably not exceed 1 cent each.

If it is not feasible to sell the eggs direct to private customers, it may be possible to sell them to a grocer who has a high-class trade and will be glad to get absolutely reliable eggs for his customers. In such a case it would be worth while to put the eggs up in cartons, with the name of the farm on them, in order to educate the customers to call for eggs from that farm. When a farmer has a good many eggs and does not wish to bother with cartons, he can often do well by selling his eggs to a hotel or restaurant.

If none of the ways suggested are feasible, then the eggs can be sold to dealers, but an extra price can be obtained from them also as soon as they are convinced that the eggs furnished them are absolutely reliable.

If there are children on the farm, they can be taught to care for the eggs, and will take pride in doing it well, especially if they are given a share in the profits.

It should be remembered that it will take time to work up a demand for selected eggs, but when people are once convinced that the eggs, can be depended on, they will not only call for such eggs, but will tell their friends about them.—Farmers Bulletin 405.

POULTRY QUERIES.

Sucking Eggs.

One of your readers wanted to know how to break a pup from sucking eggs. I have been successful in that line by giving pups all the rotten eggs they would eat. Just lay them around where they will be sure to find them and they will know when they have enough and will soon get so they can't look an egg in the face.

Others are troubled with ticks. I have solved the question of ticks and mites by using about three parts attention to one of kerosene with a wide paint brush to spread it onto the roosts. Distillate will do as well and is cheaper. And do you know I think the mites scatter the roup among the chickens as the Texas fever tick spreads the Texas fever among cattle, for I have noticed that when I have had more mites I have had more roup and that as I suppressed the mites I had less roup.

We keep about two hundred hens and raise a few hundred young chickens every year. In getting acquainted with the business we have blundered through the ticks and the mites and the roup and the limberneck, and have found that one of the best things to give the chickens is attention. One can get plenty of kerosene at any grocery store, but attention is very scarce sometimes, and when it is the mites and roup are very plentiful.—S. T. Fleenes, Ceres.

Too much leniency shown toward sick fowls, and a failure to remove them from the rest of the flock in hope of their ultimate recovery, often lead to the inoculation of the entire flock and the ruin of the enterprise.

A Healthy Chicken is an asset, a sick Chicken is a liability: because it is apt to give disease to others. It's therefore a loss, not a gain

To keep your poultry healthy—to make every hen an asset, regularly use in the feed twice a week,

Coulson's

No. 3 Condition Powders

Give it to well chickens to KEEP them well, give it to sick chickens to MAKE them well.

Helps chickens to digest and assimilate all their food, makes hens lay right up to molting and starts them laying quick after the molting season.

Harrow While You Plow

Put your ground in perfect condition for planting at one operation — by using the Racine Rotary Harrow Attachment for Plows. Readily attached to gang or sulky plow. Follows the furrow and cuts, packs and smooths the soil, keeping in moisture and leaving no ridges.

You know that the best time to harrow is immediately after the plow has turned the furrow—before the sun and wind have a chance to dry out the soil. That means — harrow while you plow. But you must get the right harrow if you want best results.

THE cutting blades of The Racine Rotary Harrow Attachment for Plows are curved. They cut throughout their full length—not simply at the point. Positively cannot clog or wind—self-cleaning. Bury the trash and litter well under the soil instead of dragging it around to the surface as do ordinary blades. If your dealer can't supply you, write direct to us for handsomely illustrated circular. Find out about this big labor-saver—today. A postal will do.

CAN YOU SAW AND HAMMER?

If you can, you can fit out your poultry house with 1910 conveniences. Other poultry keepers who work at their regular trade or business make hoppers, ordinary and trap nests, fireless brooders, fresh-air doors and windows, portable fences, and even fresh-air and portable houses, during their spare time, and you can do the same. Probably you have never been told how these conveniences can be built—everyone doesn't know these things—but you now have an opportunity to learn from the builders themselves.

Simple descriptions and 146 illustrations of everything the builders have found "just what the doctor ordered" are contained in a new book **Built and Used by Poultrymen.** This is the only book that tells you how to make these things just as though you were talking face to face with the builders themselves. Mr. Jensen tells you how he built two kinds of fireless brooders (one is shown above), and so on through the *fifteen chapters.* Read their titles and see the large number of subjects treated.

Modern Breeding Houses. Modern Colony Houses. Modern Brooder Houses. Houses for Indoor Brooders. Houses for Males and Small Pens. Adapting Barns for Poultry. Movable Fences and Fencing. Nests and Trap Nests. Brood Coops, Runs and Pens. Modern Fireless Brooders. Hot-Air Brooders. Shipping Day-Old Chicks and Eggs for Hatching. Food Hoppers and Fountains. Methods of Sprouting Oats. Other Useful Devices.

This valuable 100-page book, bound in a handsome colored cover and filled with helpful reading matter and 146 clear illustrations, will be mailed to you for **one-half** the publishers price, if you accept **our Special Offer.** Act promptly and profit by these new ideas.

Bees

SUCCESSFUL BEEKEEPING.

TO BE a successful beekeeper one should be enterprising and industrious and learn to do the right thing at the right time.

Many people fail in this pursuit not so much from a lack of knowledge as from not giving the necessary attention at the proper time. Thousands of bees are lost every winter because the owner guessed they had enough stores. Thousands of swarms abscond from inattention on the part of the owner during the swarming season. Tons and tons of honey are lost from enforced idleness because the colonies were not provided with room at the proper time.

I once had a man visit me at my home to learn why, after years of beekeeping he had not been successful. After a long conversation with him I said: "There is never an effect without a cause, and it seems you have never expected a crop of honey. If I were to suggest a motto for your shop it would read something like this: 'Blessed are they who expect nothing, for they shall receive it.'" You must have faith that you will get a crop, provide everything necessary to secure it and persistently work to that end. Today this man is one of the large producers of honey and has three fine bee yards and says the most profitable day he ever spent was the one when he found out why he had failed.

Many keep bees for the pleasure they derive from a study of their habits, and, after having overcome the fear of stings, discard both veil and gloves and, by using a little smoke, handle them freely, caring little for a few stings as the system becomes adapted to the poison.

I usually handle them without veil or gloves even on yards where the owners consider it unsafe to dispense with such protection. Some of these men believe that I have a preparation that I apply that makes me immune to stings. Such is not the case. It is only by understanding their likes and dislikes better than their owners. Always use smoke in handling them; not too much, but just enough to keep them quiet. Do not handle them immediately after a long rain or on a cool day if it can be avoided. Do not jar the hives or blow the breath directly on them. Handle them carefully and avoid crushing even a single bee, as the odor of the poison angers them. Avoid being nervous and be kind and courteous. By observing these simple rules a yard may be kept quiet and orderly often for the entire season.

In conclusion I would say that I advise no one to embark in this occupation who believes in luck or that they can succeed without hard labor and diligent study, but I know of no branch of agriculture for the capital and labor invested that pays as good returns, not only in dollars alone, but in health and vigor and the knowledge that your occupation is a blessing to your community and that it brings you in close touch with that infinite mind who has placed in your hands his tiny workmen that will reward you according to your faithfulness.—Charles Stewart, New York Bee Inspector.

ABC AND XYZ OF BEE CULTURE.

Probably one of the greatest factors in successful apiculture for many years has been the "ABC and XYZ of Bee Culture," edited by A. I. and E. R. Root and published by the A. I. Root Co. of Medina, Ohio. It is a cyclopedia of everything pertaining to honey bees; hives, honey, implements, honey plants, and is made up of facts gleaned from the experience of thousands of bee-keepers and, as the editors say on title page, "verified in our apiaries."

As complete as this book has been for many years, a new and revised edition has just been brought from the press, making the astounding number of 130,000 copies, said to be more than the combined publications of present and former works on bee culture in the English language. This book not only has fullest explanations in its text of the various processes in bee culture, but is made of greater value by profuse illustrations. The greater part are half tones, and as we open at random we see six half tones on two pages. Scenes are depicted of bee culture in America and all parts of the world, and the honey plants are so clearly pictured that they would be readily recognized.

The book will be supplied by the business office of the Cultivator if our patrons desire.

A GOOD NEWSPAPER.

The medium which keeps the Cultivator in closest touch with agricultural conditions of the great Sacramento Valley and which seems to be particularly proud of the growth and increasing prosperity of that section, is one published in the city of Sacramento. It is the Sacramento Bee, and is worthy of the liberal support which the people of the great valley are giving to it.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Possibly Blood Poisoning.

Would like to know cause of death of mule. I noticed recently that as the boy drove him in from pasture he lagged behind the rest of the stock; he soon became stone blind. The least exertion put him out of breath, and the act of drinking or taking a bite of hay would cause him to breathe very heavily. Later he would stagger and fall. His eyes were greenish and glassy. In 24 hours he died. He was just getting over a bad wire cut.—Subscriber, Woodlake.

The symptoms described would fit several diseased conditions. The trembling and falling came from heart failure. The most probable cause was blood poisoning from improperly treating the wire cut.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as. "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar Sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY,
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

Irrigation and Forestry

IRRIGATION IN WESTERN OREGON.

DISCUSSING the purposes of the National Irrigation Congress in an address following a luncheon in his honor at the Hamilton Club at Chicago on June 8, R. Insinger, manager of the Northwestern & Pacific Hypotheekbank of Spokane, and chairman of the board of governors, said that in addition to saving the forests, storing the floods, reclaiming the deserts and swamps and making homes on the land, the organization also aims to bring a better and more intelligent class of settlers to the country, with a view to the utilization of every opportunity offered by intensive farming to increase production and decrease the cost of living. He added among other things:

"The National Reclamation Act, adopted by the United States Congress in 1902, is the outgrowth of years of work by this organization to obtain the enactment of such a law. This has given the country 25 projects, representing the reclamation of 3,198,000 acres of land at a cost of $60,000,000, while 13 projects held in abeyance until the completion of the foregoing, will add 3,270,000 acres more to the crop-producing area of the United States. This total of 6,468,000 acres will furnish homes for 3,500,000 persons and add several hundred millions of dollars to the taxable property of the various states.

"The congress, which gained such wide-spread recognition at the Spokane convention, last summer, will have its 18th session at Pueblo, Colo., September 26 to 30, under the presidency of B. A. Fowler of Phoenix, Ariz., who has been actively identified with the organization for years. It is promised there will be several thousand delegates, including practical agriculturists and irrigationists, from all parts of the United States, Canada and Mexico, also from 30 to 40 foreign representatives and diplomatists, heads of national and state departments, capitalists and engineers.

"There will also be an exposition of apparatus for raising and putting water on the land and representative exhibits of products of irrigated tracts, thus bringing together in the heart of the Arkansas valley the most comprehensive demonstration of the value of irrigation in the history of the movement. Colorado has a larger acreage under ditches than any of the western states and, as practically every approved method of distributing water is in use in that state, there will be opportunities to study the various plans of supplying moisture by artificial means to the land.

"In the states from the Missouri river to the Pacific ocean there are fully 3,000,000 acres under irrigation or to be watered in the near frture. Allowing an average of 20 acres to a family and five persons to a family, this acreage will support 750,000 persons. To this number might be added 750,000 more, representing the number of persons needed to supply the wants of these tillers of the soil and to transport their products. Irrigationists claim that an average of 10 acres to the family is high enough; but, to be conservative, an average of 20 is used. On that basis these 3,000,000 arres would furnish a living, directly or indirectly, to at least 1,500,000 people.

"Planted to wheat, producing an average of 30 bushels an acre, this irrigated area would yield 90,000,000 bushels; or 24,000,000 tons of hay, if planted to alfalfa, while if in apples, as grown in the Northwestern states, the yield would be 30,000,000 tons. This enormous tonnage would call for more railroads from the great lakes to the Pacific Coast, millions of dollars worth of new equipment and the employment of hundreds of thousands of skilled machanics and laborers in mills and factories all over the country. It would also mean more business for the banker and merchant.

"One hundred and fifty million dollars has been invested in irrigation canals in 16 arid states and territories and a harvest valued at $250,000,000 is the former deserts' response annually to the intelligent application of water to the sun-scorched valleys. The possibilities of reclamation and its bearing on the future welfare of the nation can be better realized when we consider that fully 35,000,000 acres of arid or semi-arid land can be reclaimed by irrigation, in addition to the acreage now irrigated, and approximately 75,000,000 acres of swamp land by drainage. Between 10,000,000 and 11,000,000 persons are now engaged in agriculture in the United States, and practically all of the arable land in the humid regions is embraced in the 6,000,000 farms under cultivation. The average size of these farms is 146 acres.

"France is a country of only 207,054 square miles and has a population of nearly 40,000,000, yet it is the banker nation of the world and supports its people comfortably. The German empire has 208,000 square miles and a population of 60,000,000. Austria-Hungary has 261,000 square miles and a population of 47,000,000.

"Under irrigation the tendency is to greatly restrict the size of the farm unit. Experience teaches that in most irrigated districts it is impracticable for a farmer to cultivate a large holding. As a consequence the average farm under ditch is much smaller than in the humid regions. Thus provision is made for a larger farming population, with a corresponding increase in the production of farm products, thereby adding immensely to the country's wealth. Irrigation is the most practicable insurance against crop failure, and it relieves the farming industry from the element of chance.

"Irrigation invariably means intensive cultivation and this in turn means larger crops. Through the use of smaller tracts the country districts have become so thickly populated they resemble suburbs of large cities; but there is no congestion nor is there the menace of an underfed and poorly housed population. It means the farm village, lighted by electricity, furnished with domestic water through pipes, and telephones and automobiles and other conveniences. It means a union of the social features of town and the healthful ones of country life and, as some one has well said, 'the disappearance of lonesomeness without the worse evil ot overcrowding.' "—August Wolf.

Curing Lemons.

Please give process of curing lemons.—F. A. Wharton, Fresno.

We have seen lemons picked from the trees, covered with wet sand and left for months. They came out yellowed, velvety and perfect fruit. One orchardist in Los Angeles county thought at one time that he had made a great discovery and treated many loads of them by this process. Such handling is altogether too expensive, however. The usual method is to pile in tiers eight boxes high close together but with small alleyway between rows for circulation of air. The circulation of air is then controlled by tents or tarpaulins thrown over the fruit. During the sweat enough air must be admitted to keep down excess of moisture. To judge this is a matter of experience. Lemons houses are also built to provide a uniform temperature; the curing has been determined to be not so much a question of temperature as of moisture. If the moisture evaporates too rapidly a wilted and comparatively worthless lemon results. To cure lemons from a few trees or for household use we have seen boxes stacked under shed and covered closely with newspapers to prevent evaporation, the newspapers being raised occasionally to ascertain amount of moisture. The curing is sometimes hastened by placing in close rooms and subjecting to moist heat, keeping the temperature at 95 degrees. This will cure them within a few days, while the other method in a cool season may take several weeks.

Keeping Cider.

Please inform me how to keep cider sweet.—T. C. D., Lankershim.

Certain chemicals have been used for this purpose, but they are injurious to health and the pure food law will prevent sale of cider so preserved, excepting that we believe the use of benzoate of soda is permitted in limited quantities. A very reliable method is to sterilize by use of heat. Place cider in cans or bottles and set in cold water using grating of some kind to prevent contact with the bottom of the boiler. Heat water in boiler until cider is raised to a temperature of 160 degrees. Allow bottles to cool and stand a few days when the liquid is racked off and the heating process repeated. While still hot bottles are sealed.

Larger Peaches.

A short time since a correspondent of your paper asked what he should do to secure larger fruit, especially peaches. Conditions and soil may be different but here is my experience:

In the spring of 1904 I planted about half the fruit trees I thought would be necessary to supply my family. The fruit has been large in size and excellent in quality. These are the conditions: Location near Strawberry Park, Los Angeles county; mesa soil, very hard when dry but cultivates perfectly under irrigation; first trees set 20x20 feet but 24x24 feet would have been better.

The first year stable manure was spaded in between the trees and the winter's supply of ashes from the kitchen stove was scattered around the trees, thus supplying plenty of potash. Have irrigated whenever the trees seemed to need it, except that I withhold water when the fruit is ripening and late in the season to allow the new growth of wood to harden before possible freezes.

Peaches of three-fourths pound weight were not uncommon and a small Wickson plum tree bore fruit 2⅝ inches in either diameter.

I clip off nearly all the new growth from the plum trees as soon as the fruit is off, leaving perhaps six inches of the present year's growth and thin the young fruit severely in early summer; more pruning is done in the center of the tree in the winter.—G. O. Lanpher.

Stimulants.

Is kainit or gypsum a plant stimulant? Also is it advisable to apply lime at time of seeding oats, wheat or barley?—Subscriber, Orland.

It is somewhat difficult to tell what our subscriber desires. Kainit contains a large percentage of potash, hence is a fertilizer or plant food. It is not a stimulant in the sense that nitrate of soda is; strictly there are no stimulants in plant life. Gypsum is not even a plant food as it contains nothing which plants require. It does, however, improve condition of many soils. Especially, it makes available the potash in the soil. If gypsum is applied we would not use kainit. Lime, like gypsum, is more of a soil corrector than a plant food, but on sour soils and soils containing a large per cent of magnesia will be very valuable. From 500 pounds to a ton an acre is used. We may add that lime is required by all plants hence is one of the necessary ingredients of soils, but to that extent may be said to exist in practically all soils.

Sowing Lawn.

Can you advise us as to the wisdom of putting in a clover lawn this fall in this locality, and just when should it be seeded?—Mrs. H. S. Stricker, Lankershim.

Lawn can be sown in your section almost any month in the year, but it is easier in the spring or fall. It starts quicker and has some advantages when sown in the spring but if Bermuda is a pest in your section, as it is in practically every part of the state, the fall sowing is better because the Bermuda will not grow in the winter months and the clover or blue grass has a chance to become thoroughly rooted before it begins to grow with the warmer weather. If the ground has been kept wet and hoed during the summer, probably but few weed seeds will be left to bother. Some prefer to manure very heavily in the spring, spade in during the summer, wetting and hoeing constantly. This makes an excellent seed bed when cultivated and fined in the fall. If everything is ready for the sowing we would prepare ground immediately and sow when convenient.

Chlorosis.

I send leaves and fruit of orange tree. What is the trouble? Only a few branches were affected. These were taken from a long, straight limb in a large Valencia tree, presumably from sucker growth, but other twigs are also affected.—F. D., Azusa.

This is the worst case of chlorosis or yellowing of orange leaves we have even seen. The twigs also had some fruit from the size of walnuts up to full size and all of it yellow. This doubtless came from off-bloom caused by poor physical condition of the tree and soil. Hardpan will cause it, as will many other improper conditions. We would refer our inquirer to the Cultivator of August 11th, page 124. This article gives one theory of cause of chlorosis. It is a trouble which has never been thoroughly in-

The Rural Californian

The Rural Californian
115 North Broadway, Los Angeles

vestigated and no one can tell the exact cause. A study of the case and putting the tree in a good general condition will generally result in a cure.

Alkali Pasture.

What is best to sow for alkali land pasture?—Subscriber, Hynes.

Alfalfa makes the best pasture and will stand a certain amount of alkali. Our subscriber does not inform us as to the content of the soil, so we can not tell whether alfalfa will stand the amount he has or not. Where such crops will not succeed, salt grass or even Bermuda have been used. Bermuda is ordinarily considered a pest and is not the best of pasture. The Australian salt bush has done well but like the Bermuda is a makeshift and only desirable for such land as will not tolerate better crops.

Jelly from Tunas.

Can any reader of the Cultivator give me directions for making jelly from tunas or cactus fruit?—M. O. C., Anaheim.

We will leave this entirely to our subscribers as we never have heard of such use of cactus fruit.

Lemon Tips Curling.

Please give remedy for curl tip in lemon trees.—C. H. H., Lakeside.

We will appreciate seeing specimen of these leaves as we could not determine the trouble without examination. We have seen tips attacked by aphis, that were stunted and the leaves somewhat curled. If the curling comes from any fungous trouble the weaker Bordeaux mixture should be applied.

Possibly Old Age.

Recently bought team of old horses and fed heavily of green corn and watermelons. One of them scoured for a couple of weeks, but at the same time gained slightly in flesh and improved in general condition. Later one took sick and died; the other similarly affected, recovered. Were the green corn and melons to blame?—Subscriber, San Bernardino.

When the time comes for the healthy old horse to die he goes out in this way very often. I could duplicate case after case where the old horse was all right in the morning and scoured a little, seemed to have a little pain, and in a few minutes lay down and went to sleep. It is a natural death and if we humans lived as close to nature as the horse we should all live out the fulness of our time and without any impairment of our faculties go peacefully to our death.—M. E. S.

Sorghum Poisoning.

I planted sorghum seed in the middle of July, and on account of dry weather it has a stunted growth; only half the planting is headed, some not more than a foot high where, under proper conditions, it would have been six to ten feet high. I have read of the danger of prussic acid poisoning from stunted sorghum. Would it be dangerous to turn my cows on this field? Have never had any trouble before, but always had good growth. Also would it be dangerous to turn band of horses on it?—Subscriber, Turlock.

I know all the terrible things that are said about sorghum. I have been growing and feeding it for many years and have not had anything happen worse than one case of bloating. This proved to be very mild and was afterwards entirely avoided by feeding less of the sorghum at the first. The prussic acid talked about was found some years ago. The bulletin issued on the subject notes only two cases and no cause could be definitely assigned for the behavior of the plants. As sorghum is a dry land plant and has often suffered from drouth, that is not thought to cause the trouble. It has been found in the East that many cases of disease came from the mildewed and mouldy condition of the stalks of both sorghum and Indian corn.

This year we are in the same trouble you are and have a large quantity of sorghum that will not mature, now that the water is gone from the canals. This we have been cutting and feeding until only that less than than three feet is left. In the meantime the amount fed the cows has been gradually increased for ten days until we thought it safe to turn them into the field. I was down yesterday and after two weeks they had finished the sorghum and returned to the alfalfa in the next field. We have always fed off the second crop of sorghum to the cows and calves without anything worse happening than a few cases of scouring, so we do not fear it as a feed. Try yours slowly and I hardly think you will have any trouble.—M. E. S.

Rose Mildew.

I enclose twig of rose covered with white mildew-like substance. The rose is so situated that it gets but little sunshine. What is the trouble and what can be done?—Subscriber, Long Beach.

The best thing to prevent mildew is to plant roses where they will have full sunlight all day, but where they are already located as this one is, the only remedy is to dust with sulphur or use potassium sulphide. The use of sulphur is the simpler. Merely scatter the resublimed flowers of sulphur over the foliage when slightly moist with dew or fog. However, where the sunlight does not reach the plant so as to vaporize the sulphur, the effect is not so good. If potassium sulphide is used mix at the rate of three-fifths ounce to ten gallons water. This does not color or affect the foliage of the plant, and perhaps for plants in shady situations would be preferable.

Soap Made Without Boiling.

To five pounds of fat free from salt take one can of lye. Red Seal or any 98 per cent lye will do. Dissolve lye in three and a half pints of water, stirring until lukewarm. Heat fat to same temperature and in a fine stream add the lye to the fat, not the fat to the lye. Stir constantly until it begins to thicken and is smooth. Do not beat too long or it will separate. Line a baking tin with cloth or paper, pour in soap and when sufficiently hard cut in squares. This soap will be fine, white and hard.—Mrs. Johnson, Ripon.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

RARE PLANTS.

Psidium Aromaticum—Best Guava ever introduced. Extra vigorous grower; fruits globular, 2½ inch diameter; skin and pulp rose color; highly perfumed and aromatic; none better for jelly in Southern California. Strong, 3½-inch pots, 50 cents each, $5 per dozen. For sale only by the Montarioso Nursery, Santa Barbara, Cal.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

FARM LANDS FOR SALE.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now, $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale or Exchange—70 acres $3,500, 15 miles from St. Helena, joins Aetna Springs. 10 acres vineyard, fruits, nuts, berries, fine hog pasture, well watered, wood. Team, harness and spring wagon. Fully equipped poultry plant. Cow, farm implements, 7-room house, barn, granary. Owner selling on account old age. M. Fulton, Pope Valley, Napa Co., Cal.

Where the Red Apple Grows—If you are interested in apple culture and desire to own 5, 10 or 20 acres of the best producing apple land in Southern California write me for information about the Yucaipa Valley. Land sold on easy payments if you so desire. Address Chas. J. Creller, Sales Agent, 112 Merchants Trust Bldg., Los Angeles, Cal.

For Sale—15-acre vegetable and fruit ranch in the famous Arroyo Grande Valley; 8-room house, barn, etc. Plenty of water. Good nearby markets in oil field. Price $8500, $3500 cash, balance 2 years, 8 per cent. R. M. Plympton, owner, Arroyo Grande, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

2285 Acres Choice, Deep, Sandy Loam—Ideal for subdivision or eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—160 acres relinquishment, small house on and part plowed, surface well, in artesian flowing water belt, good neighborhood; 4 miles from Lancaster, Los Angeles County; $750. Come or write J. G. Mihelitch, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—A 14-acre farm, good for alfalfa, orchards, or small fruit. Good market, 2½ miles from town, ½ mile from school. Frame house and barn. Price $2250. Robert Werner, Loma Linda, Cal.

Fruits, Flowers, Sunshine, Progress—All these invite investigating beautiful Hemet Valley, Southern California. Booklet free. William Kingham, Hemet, Riverside County, Cal.

For Sale—El Cajon Grant Land. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. Hawley, 1548 D St., San Diego, Cal.

For Sale—160 acres in Antelope Valley. Good land and plenty water. Price $17.50 per acre. 160 acre relinquishment for $3.00 per acre; good land. Wm. Ohlson, 305 Mason Bldg., Los Angeles, Cal. Phone Broadway 1842.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

For Sale—A bargain in a 3-year-old orchard and vineyard on main canal. For particulars address Box 49, Route 2, Kerman, Cal.

Sacrifice Sale—$2,000. My ten-acre dairy and chicken ranch with all improvements. Under irrigation. D. Clayton, Colusa, Cal.

For $1,900, Five Acres—Three, deciduous orchard; two, alfalfa. Full water right. F. Neal, Hemet, Cal.

LIVE STOCK.

Milch Goats—Young three-quarter Toggenburg, extra fine buck and several does, hornless beauties. For sale. B. A. R. Stocker, San Luis Obispo, Cal.

Registered Shorthorn Bulls and **Poland China Hogs** for sale. Best breeding. P. H. Murphy, Perkins, Cal.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines and farm machinery that will do the same work as new at half price. Domestic and irrigating windmills and tanks; 2½-H.P. Dempster, 4-H.P., 6-H.P. Fairbanks, 9-H.P. Moore, 10-H.P. Lambert, 20-H.P. Fairbanks like new; 25-H.P. engine and mining hoist; 2-H.P. steam boiler and engine; complete wood sawing outfit, mounted on iron trucks with 9-H.P. engine, complete for $225. Light express wagons, surrey, $35, baler, header; gang, disc, road, riding, and walking plows; cultivator, feed rack, wagon tank, fruit crusher, bone grinder, pipe, Fresno and Slip scrapers. Most anything a rancher wants second-hand. Demmitt Co., upstairs, 120 N. Main St., Los Angeles, Cal.

For Sale—15 H.P. Otto Engine, guaranteed like new. Also deep well pump. Machinery Exchange, Main and Bruno Sts., Los Angeles, Cal.

For Sale—3 H.P. Distillate Engine, also one with Jack attached. Bailie & Brandt Co., 943-945 No. Main St., Los Angeles, Cal.

TREES.

Fine Large Eureka Lemon and Valencia Orange trees, fine for replanting. Choice lot of fine Washington Navels. Order quickly. They are going. Home 'phone 1731. John R. King, Whittier, Cal.

Fruit Trees—Get our advance prices. Choice 4-inch pot roses, 15c. Our tree specials won't last long. Get wise. Ballou's Nursery, Pasadena, Cal.

Marsh Seedless Grapefruit—600 large trees for sale. E. S. Thacher, Nordhoff, Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal.

WANTED.

Farm Manager—Covering years of practical and scientific dairying, sanitary and certified milk, grade and registered stock, East and West, will be open for similar position after September 1st. Or, if preferable, would consider proposition to hire your farm for term of years, on share or cash rental, if carrying 50 to 150 deep milkers, tools, etc.; sterling references. Address Manager, Box 34, Parker, Arizona.

Wanted—Your work pays the expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. United Trade School Contracting Company, 647 Pacific Electric Bldg., Los Angeles, Cal.

Butterman wants a complete dairy of good cows, 75 to 150, on share; party must have alfalfa and feed, good buildings. Have had 16 years' experience in business and can give good references. For further particulars apply to Henry Grandy, Wineville, Cal.

Wanted—Washington Navel and Valencia Orange, and Eureka Lemon trees. State quantity you can supply, also sizes and lowest price. Address P. W. Cheney, 312 Byrne Bldg., Cor. 3rd and Broadway, Los Angeles, Cal.

Wanted—300 farms at once, near coast or good towns. Each must bear close inspection. Can supply buyers and traders for good propositions. Give normal cash-basis price. Parrish Barker, 207 Union Trust Bldg., Los Angeles.

A Young, Industrious American, with thorough High School education, wants position on some large cattle or dairy ranch for sole purpose of learning the business. Address Box P, Cultivator Office.

Wanted—To lease on shares from 30 to 100 acres good alfalfa ranch with plenty water and good buildings. Address A. Bader, General Delivery, Pasadena, Cal

DAIRY SUPPLIES.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey, 108 E. 8th St., Los Angeles, Cal.

POULTRY.

White Orpingtons—Cook Strain. We offer for sale a limited number of trios and pens of utility and exhibition stock at bargain prices for the summer season. Our breeding pens are imported direct from Wm. Cook & Sons, Scotch Plains, N. J., and are sons and daughters of first and second prize winners, Madison Square Garden. Messrs. Cook & Sons say of them: "They are all from some of the finest birds in this country." Book orders now for next season's hatching. Eggs $5.00 per 15. $25.00 per 100. Day-old chicks 50c each. October delivery. Rancho La Solana, Box 143, Chula Vista, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

For Sale—White Holland turkey gobbler, $9.00. Also trio, $20.00. The male and females unrelated. All 3 years old. Prepare for breeding season when stock will be high and very scarce. Mrs. B. Hocking, Route 2, Box 50, Ontario, Cal.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers
Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME.
A few cockerels for sale. C. C. Bonnell, State Vice-President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

For Sale—One hundred 4 months old, one hundred 5 months, one hundred 6 months old White Leghorn pullets, Watson strain. Healthy and clean. W. J. Webb, Santa Maria, Cal.

Lodi Hatchery—Just hatched, chicks from healthy, heavy laying stock. Booking orders for later delivery. T. C. Hawley, 504 E. Elm St., Lodi, Cal.

Single Comb Brown Leghorn Eggs—$5.00 per hundred, $1.50 single setting. Mrs. E. Foran, Box 445, Visalia, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

For Sale—Thoroughbred White Minorca cockerels at $1.00 each and up. T. H. Bourn, R. D. 2, Santa Ana, Cal.

S. C. Rhode Island Reds—Pure bred stock for sale. Pullets at $1.00 each, cockerels for $2.00. L. Haynes, Madera, Cal.

MISCELLANEOUS.

We Sell Patents—We charge $1.00 for our services if we fail and $10.00 if we succeed. We have a list of over 200 American manufacturers who are looking for patents. If your patent can be sold, we can sell it. Send for our list of satisfied clients and full information. The Citizens Protective Association, Latonia, Ky.

For Sale or Exchange—A No. 1 Twenty Century Carbide Gas Plant, 35 burners strong; with two-burner hot plate. Some globes and burners. Cost $100.00, in perfect order. $50.00 cash or would exchange for Bartlett & Kiefer pears and cherries, if No. 1 stock. Address H. L. Bauer & Sons, 737 Spring St., Los Angeles, Cal.

For Sale—Registered Holstein Bulls; 1 to 2 years old. Some sired by Prince Juliana, brother of former world's record heifer, Juliana De Kol. Dam and granddam, A. R. O. cows. Three record-breakers in some of their pedigrees. M. E. Sherman, Minnewawa Vineyard, Fresno, Calif.

THE SPELLING MATCH.

Ten little children standing in a line,
"F-u-l-y, fully," then there were nine.

Nine puzzled faces, fearful of their fate,
"C-i-l-l-y, silly," then there were eight.

Eight pairs of blue eyes, bright as stars of heaven,
"B-u-s-s-y, busy," then there were seven.

Seven grave heads shaking in an awful fix,
"L-a-i-d-y, lady," then there were six.

Six eager darlings, determined each to strive,
"D-u-t-i-e, duty," then there were five.

Five hearts so anxious, beating more and more,
"S-c-o-l-l-a-r, scholar," then there were four.

Four mouths like rosebuds on a rose-tree,
"M-e-r-y, merry," then there were but three.

Three pairs of pink ears, listening keen and true,
"O-n-l-e-y, only," then there were two.

Two sturdy laddies, ready both to run,
T-u-r-k-y, turkey," then there was one.

One head of yellow hair, bright in the sun,
"H-e-r-o, hero," then the spelling-match was won.

—New Orleans Picayune.

THEIR SYMPATHETIC FRIENDS.

THE fresh autumn wind had given Mrs. Kirkland a glowing color and brought the gleam of youth and health into her dark eyes.

"You look very blooming, Jessie," said her sick husband, admiringly from his nest o fpillows on the sitting-room couch. He held her cool hand for a moment and then, releasing it with a sigh, remarked, wearily. "A few hours away from me has done you good. I knew it would brighten you up to go out among your friends. Did you see many of them?"

"Oh, yes, Rob, and they were all very sympathetic."

Kirkland made an effort to look properly grateful. Mrs. Kirkland, smiling, sat down on a hassock by the invalid's couch and prepared to relate the details of her little outing.

"First," she said, "I went over to your Aunt Harriet's, for I knew that even the fact of your having two broken ribs, a fractured collar bone and a sprained ankle would not be in her mind a valid excuse for my not calling on her during the month that you've been ill."

"How was she."

"No worse than usual, but exceedingly bitter against automobiles. She said she was not at all surprised that you got hurt, for automobiling is a reckless and extravagant habit for people in our present circumstances There!"

"Why, didn't she know that I wasn't in our own car and that I sold ours the very day after those signed notes brought us into such trouble?"

"Yes, of course she knows that," said Mrs. Kirkland, "but your accident is a delightful justification of her present theory that all the troubles in the world grow out of automobiling, so she couldn't resist pointing a moral. However, she sent her love to you and said to say you ought to be very thankful that you still have your head on your shoulders and a roof over it.".

Kirkland made a grimace. Mrs. Kirkland went on cheerily:

"Then I dropped in to see Clara Holland. I'm afraid things are going badly with her now. Tom's been drinking again and his mother thinks it's all Clara's fault and won't even help her with the grocery bill. And her baby is sick and peevish. My heart just ached for her until she said that when she thought of what trouble you and I have had lately she felt she oughtn't to complain of her little worries. She feels dreadfully sorry for us, Bob."

"Very kind of her, I'm sure. But we can still struggle with our own grocery bill! Poor Clara means well of course."

"Yes, indeed. It was refreshing to go into the Bowers'es luxurious home after the disorder and confusion of Clara's flat. I gladly accepted Mrs. Bowers' invitation to lunch. Mr. Bowers comes home for that meal now and he looked so sturdy and handsome, notwithstanding the seventieth birthday which he celebrated last week, that it did me good to see him. He was anxious to know how you are getting on, and as I was leaving he said he had a very fatherly feeling toward you, and just as soon as you are well enough he intends coming over to give you a good talking to about the folly of signing notes for people. Don't scowl, Rob. I tell you this only because I think it almost funny. As if you didn't know more about that now than he could ever tell you!"

"Mrs. Bowers sent her love and a box of tuberoses. I left the flowers in the hall because I know you hate the odor of them."

Kirkland made another grimace. His wife continued:

"From there I went downtown to do a few errands. I met George Harris in the bookstore and he inquired after you. He said he knew you would have courage to bear illness and financial loss. He said he didn't know what he would do if he should ever have such a hard run of luck. He looked pale at the idea of such a fate."

"George never was a heavyweight," comented Kirkland, good-naturedly.

"I stopped to speak to Miss Canfield as I was going through Blankley's store. You know she is the woman who sold us the lovely Venetian lace collar you gave me last Christmas. She said she had heard of our 'reverses of fortune' and she felt very sorry for us. I thanked her, and just as I was going on she remarked, 'Well, anyway, Mrs. Kirkland, you still have your real laces. That's some comfort.' That was a consolation I had never thought of before.

"On the street car coming home I saw Mr. Bayley. He said solemnly that he had thought of us often and had intended to call to express his sympathy after a proper period, but he supposed that as yet we desired to see no one but our most intimate friends."

"I hope you assured him that was the case."

"I didn't urge him to call immediately. Do you wonder, Rob, that I felt very happy when I got back to our cozy and peaceful home, where there was no one to remind me of troubles that don't count—that don't matter in the least bit so long as we have each other and you are getting well so fast?"

"You dear girl!" was all the answer Kirkland made.

HAMBURG STEAK.

This name is commonly given to inexpensive cuts of beef chopped, seasoned a little, shaped into small balls or into one large thin cake, and quickly broiled in the way that a tender steak would be. Owing to the quick cooking much of the natural flavor of the meat is developed and retained. The fact should be kept in mind that Hamburg steak must be made from fresh, well-ground meat. It is much safer to chop the meat at home, as chopped meat spoils very quickly. Much depends, too, upon browning it sufficiently to bring out the flavors. Many cooks think that Hamburg steak is improved if the meat is mixed with milk before it is cooked.

In some parts of the country, and particularly in some of the Southern States, two kinds of beef are on sale. One is imported from other parts of the country and is of higher price. The other, known locally as "native beef," is sometimes lacking in flavor and in fat and is usually tougher. Southern native beef such as is raised in Florida is almost invariably, however, of extremely good flavor, due presumably to the feed or other conditions under which it is raised. By chopping such meat and cooking it as Hamburg steak, a dish almost as palatable as the best cuts of the more expensive beef may be obtained. In such cases, however, it is desirable because of the low percentage of fat to add suet or butter to the meat. The reason for this is that in the cooking the water of the juice when unprotected by fat evaporates too quickly and leaves the meat dry. This may be prevented by adding egg as well as fat, for the albumen of the egg hardens quickly and tends to keep in the juices. The proportion should be one egg to one and one-half pounds of meat.

SAVORY ROLLS.

Savory rolls in great variety are made out of chopped meat either with or without egg. The variety is secured by the flavoring materials used and by the sauces with which the baked rolls are served. A few recipes will be given below. While these definite directions are given it should be remembered that a few general principles borne in mind make recipes unnecessary and make it possible to utilize whatever may happen to be on hand. Appetizing rolls are made with beef and pork mixed. The proportion varies from two parts of beef and one of pork to two of pork and one of beef. The rolls are always improved by laying thin slices of salt pork or bacon over them, which keep the surface moistened with fat during the roasting. These slices should be scored on the edge, so that they will not curl up in cooking. The necessity for the salt pork is greater when the chopped meat is chiefly beef than when it is largely pork or veal. Bread crumbs or bread moistened in water can always be added, as it helps to make the dish go farther. When onions, green peppers, or other vegetables are used, they should always be thoroughly cooked in fat before being put in the roll, for usually they do not cook sufficiently in the length of time it takes to cook the meat. Sausage makes a good addition to the roll, but it is usually cheaper to use unseasoned pork meat with the addition of a little sage.—U. S. Bulletin 391.

A GOOD WORD FOR THE FRIVOLOUS.

"Our besetting sin is to be too serious and set too high a value upon sobriety," says Margaret E. Sangster in the Woman's Home Companion for August. "I hold a brief for pure fun. Laughter is wholesome; mirth does more good than medicine. Not merely when we are on a holiday, but in mid-current of the daily round we are the better for an interlude of amusement. The person who was born without a sense of humor is greatly to be pitied. No situation is intolerable if one can see the fun in it. When I hear or see condemnation of a girl's gaiety, I am forced to the conviction that the grave censor never had a girlhood worth the name or else was born under a baleful star. Immoderate giggling belongs to a transient phase and should not be reproved when children are in their teens; rather it should be rejoiced in, and their elders look back in tender wistfulness on their own days of such thoughtless delight. Be as frivolous as you please, dear maiden and matron, in the summer days and be assured that in its place frivolity is the sunshine that dances on the wave. Some of the most portentous people one meets, people solemn and severe, and given to frowning, are fools underneath their masks. Some of the lightest hearted, gayest and most winsome in their capacity for seeing fun and making it are among the great and wise. If one has no native sense of humor, one should endeavor by every legitimate means to acquire it. An evening spent at a play which from the first act to the last scintillates with jests and irresistibly provokes mirth is a boon to tired folk; so, too, is an hour with a novel in which the serious underlying purpose is illuminated by flashes of fun on a summer day or a winter afternoon."

LINEN WALKING-SKIRTS.

The walking-skirts in linen, as a rule, clear the ground by full two inches. Practically all of them are pleated. English models are rather conventional and are followed by the majority of American tailors. They are made with side-pleated skirts, the pleats turning back from a narrow centre-front box pleat and meeting in the back, where they fasten.—Harper's Bazar.

PAY NOTHING
UNLESS
PERFECTLY
SATISFIED
(DON'T SEND A CENT)
YOU MAY ORDER ONE OF THESE
FRENCH CURLED OSTRICH PLUMES
EVERY ONE of them of the HIGHEST QUALITY IT IS POSSIBLE TO PRODUCE

And we will send it to you, allowing you to examine it, criticise it, and unless you are perfectly satisfied that it is a wonderful bargain, worth double our price, and the best Plume Value you ever saw, send it back without paying one cent.

WE IMPORT THESE PLUMES DIRECT FROM AFRICA and save you the combined profits of the importer, wholesaler and retailer, as our prices show. Order from the following:

$4.00 Value, Our Price, $1.98
$5.00 Value, Our Price, $2.98
$7.00 Value, Our Price, $4.25
$9.00 Value, Our Price, $5.45
$12.00 Value, Our Price, $6.75

IN OUR BIG BOOK you will find a large assortment of French curled and willow plumes and ostrich tips, any of which we will send, charges paid, subject to examination.

San Francisco and Los Angeles Produce Markets

Los Angeles Markets

LOS ANGELES, Sept. 14, 1910.

Butter.

Heavy receipts of local butter last week. Prices remain the same on all grades.

Price to trade 2½c in advance of the following Produce Exchange quotations:

Extras	.32½
Firsts	.31
Cooking	.25

Cheese.

Northern fresh	17@17½
Anchor, large	.18
Oregon Daisy	.19@20
Imported Swiss	.30
Domestic Swiss	.22@24

Eggs and Poultry.

All grades of eggs are in strong demand. Prices on local ranch show no change. Others are mounting.

Paying price f. o. b. L. A. is:

Local ranch candled	.43
Case count buying price	.39
Eastern fresh	.35
Eastern Storage	.30@32

Dealers pay for live poultry f. o. b. L. A.:

Hens, per lb	.17@19
Roosters	.8@16
Broilers	.17
Fryers and Roasters	.17@18
Turkeys	.22@26
Geese	.15
Ducks	.16
Squabs, per doz.	.1.50

Live Stock.

The following quotations are f. o. b. Los Angeles, on all stock:

Hogs, 175 to 200 lbs	.9½
Prime Steers	.5
Heifers	.4@4½
Calves, per lb	.6½
Sheep ewes, per head, shorn	.4.00@4.50
Lambs, per head	.3.50
Wethers, shorn	.4.00@4.50

Potatoes.

Wholesale prices are:

Local Burbanks, ctl	.1.25@1.40
Highlands	.1.30@1.50
Salinas	.1.60
Sweets, Yellow, per ctl	.2.00

Onions.

Hay.

Scott, Magner & Miller says:

Arrivals of hay for the week have amounted to 5000 tons; this is considerably less than the average that we have been receiving on the San Francisco market for the last few weeks. It is a good thing that shipments have decreased to this extent, for if we had continued to receive as much hay as has been coming of late, it would have been nearly impossible to have handled it here to any satisfaction.

The condition of the market has remained just about as it has been for the last few weeks. Arrivals have been so large and have continued to come so steadily that it has been most difficult to obtain movement of the hay from the cars and boats from day to day.

The bulk of the hay that has been arriving has been marketed here at between $8.00 and $10.00 per ton. Any hay selling above $10.00 must be something exceptionally nice. Purchases in the country of late have been decidedly light, as there has been no attraction in the situation to induce operations to any extent.

There has been some hay shipped lately for export account and the demand for coastwise shipment has also improved a little.

Alfalfa hay has been arriving freely and has been readily sold at full quotations. Shipments of alfalfa to the northern coast cleared this market of any accumulations or surplus, leaving the situation in good shape.

Fancy wheat	.12.00@12.50
No. 1 wheat or wh and o	.9.50@10.50

Deciduous Market

SACRAMENTO, CAL., SEPT 10, 1910.

The following from the circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, September 9th, 1910.

Peaches.

154 cars: Shipment of this week shows a marked falling off from the preceding week and the difference will be even greater in the seven days to follow. Salways are now practically done and there is not a great deal of stock available outside of Levy's Clings.

Pears.

52 cars: Shipment of this fruit shows a further falling off and as is the case with peaches this will be even more noticeable during the coming week. The crop is now practically shipped.

Grapes.

301 cars: Grape shipments consist almost entirely of Tokays, although there are few Malagas moving in car lots and small shipments of other varieties such as Black Morocco and Cornichon are now going forward in assorted cars. The grape movement has been a little less than was expected this week, and from present appearances will remain at about the same figure for the week to follow. Stock is universally admitted to be much finer than usual.

Weather conditons remain exceedingly favorable. With warm days and cool nights the coloring of the fruit is going on rapidly and these conditions are also favorable to the full and perfect development of the fruit.

Citrus Market

LOS ANGELES, Sept. 14, 1910.

Probably not 500 cars of Valencias are yet to go and this small quantity forces proper consideration of the merits of the fruit, and fair prices are being maintained in every market. Another favorable feature is the cleaning up of the the low grade 'dry" fruit. Though a little of it still appears at times, the bulk of such stock is out of the way. The green colored fruit is still on hand, but fortunately this is getting no worse as the season advances. Last week's quotations, or even better, are being maintained.

The lemon market is not only holding its own, but probably is even better than a week ago. Foreigns are in light supply and nearly all sections, and especially the Southern states, are exhibiting keenest desire to secure California fruit.

Shipments.

Shipments of all citrus fruits to date since November 1, 1909: 29,093 cars, of which 24,603 were oranges and 4490 lemons. To same date last year: 36,543 cars, of which 30,600 were oranges and 5943 lemons.

NEW YORK, Friday, Sept. 9.—Four cars sold; market unchanged; cloudy and warm.

VALENCIAS—	Avge.
Gabriella XC, Independent Ft. Co.	.$3.15
Citrus Belle SD, Ind. Ft. Co.	2.30

THE RUSSIAN THISTLE.

Continued from Page 243.

Leaves long and needle-like, averaging from ½ to 3 inches. The tip is armed with a sharp spine.

Flowers borne in the axils of the leaves and protected by the spiny bracts. Color, white to purple, with prominent yellow stamens.

Seed made up of a long green embryo coiled so as to be in the form of a round flattened snail-shell. It is attached horizontally and becomes dark when ripe. The covering consists only of a thin skin, with no protecting coat. This lack of albumen makes it impossible for the seed to remain long in the ground without germinating and is an important factor in the methods for controlling the weed. The vitality of weed seeds is very important when we consider methods of combating them, for it is difficult to eradicate a weed when its seeds may germinate any time within fifteen years. This is true of mustard, clover, wild carrots, and corn. Pumpkins, peas, beans, etc., germinate almost entirely in one year, and to this class belongs the Russian Thistle.

It is very improbable that any of the seeds of the thistle will remain vital in the ground for a longer time than 2 years, while the great majority of them germinate before the end of the first year. If buried shallow the germination is much more rapid than when buried deep in the soil. All dry weeds then should be plowed under very shallow in the fall of the year and most of the seeds will germinate early in the spring.

In the laboratory, under favorable conditions, the seeds have been germinated in 10 hours.

It is interesting to note that the seeds will not produce well if sown on wet soil. It is strictly a dry soil pest, and a wet spring is unfavorable to its growth.

Destructiveness.

"A weed new to America made its appearance a few years ago in the wheat-raising region of the Northwest, and has already caused damage to the estimated amount of several millions of dollars. Spreading rapidly as it is over a new territory and becoming more destructive in the region already infested, it threatens serious consequences unless prompt measures are taken to subdue it."—Bull. 15, U. S. Dept. of Agri., 1894, p. 7.

As a pest to cultivated crops, the Russian Thistle cannot be compared to Morning Glory, Canadian Thistle. Johnson Grass, or White Malva. But to grain and uncultivated crops it is the worst weed pest known. It not only crowds out all other growths, but takes from the ground a large amount of nourishment which is always needed in a grain field.

In reproduction it is remarkably prolific. The following worked out by Mr. L. H. Dewey will give some idea of this:

"A single plant of average size, two to three feet in diameter, and weighing two to three pounds at maturity when dry, is estimated to bear 20,000 to 30,000 seeds. Single plants have been found six feet in diameter, weighing about 20 pounds when thoroughly dry, and estimated to bear 200,000 seeds. At maturity the heaviest and strongest parts of the plants are the seed-bearing twigs. The inner branches receive little of the wear incident to tumbling about and are only strong enough to hold the plant together."

Methods of Control.

In controlling weeds we have two distinct classes to deal with, according to the method of growth. One class is constantly sending up new shoots from an underground stem and can be controlled only by constant summer knifing. To this class belong Morning Glory, Canadian Thistle, Johnson Grass, and White Malva. They are especially harmful to such cultivated crops as beans, beets, berries, and other small fruits. To the second class belong plants with only one tap-root from which must come all nourishment to produce seed for next year. They are absolutely dependent upon seed for reproduction, while the members of the first class may be produced by seed, but usually from a growth on the underground stem. To this last named class belong the tumbleweeds including the Russian Thistle. In the methods of control, then, we are to deal with a plant when once cut off destroyed forever, and if cut off before the seeds mature, the next generation is immediately stopped. The main thing is to know when and now to go about the work in the different crops.

Hay and Grain.—This year is the time to prepare for next year's crop. As soon as the hay is baled the ground should be plowed shallow, so as to enable most of the seeds to germinate before time for the first spring plowing. If the last crop was left for grain and headed, the stubble should be burned. The heat from the fire alone will destroy a large percentage of the seeds, for it has been proven that the thermal death point is between 72° and 78° C. By plowing after burning the grower will find few thistles the next year. In burning great care must be taken not to fire the brush on the hills, or other uncut grain. It may be impossible for the foothill farmers to fire on this account.

The spring plowing will destroy what seeds have germinated after the fall plowing, and the next important step is to get the grain in before a dry spell, so that it may get a start of the thistle.

In some localities it has been necessary to resort to summer fallow, but in this county much of the land will raise cultivated crops, and the pest is easily controlled by cultivation.

In sowing it is of course important to sow clean seed. Farmers in the infested district should not plant seed raised on their own land, and farmers in other parts of the country must avoid seed from infested areas.

No flax, wheat, barley, oats, millet, alfalfa, clover, nor other grain or grass seeds, nor shelled corn should be obtained from the farms in Ohio, Indiana, Illinois, Michigan, Iowa, Wisconsin, North or South Dakota, Nebraska, Kansas, Idaho or Canada, for planting until the grower has first made sure that such imported seed has not been raised in a Russian Thistle district.

"Oats, when properly grown, often choke out the thistles, and hence escape injury. If, on the other hand, they are sown thinly or on poorly prepared land, the thistles may completely ruin the crop. Millet, the only grass largely cultivated for hay in the Dakotas, is such a rank plant that it is injured very little by any weed."—L. H. Dewey.

Crop Rotation.

The possibilities offered by this system of eradication in this county make the problem here much simpler than in some other places where only hay and grain can be grown.

Much of the land shown in the chart as infested with the weed is now in orchard and cultivated crops.

Over five hundred acres in the neighborhood of Simi are in sugar beets, and where properly hoed the thistle is not to be found, while in other poorly tended fields it is yet a pest. Of course, it is not an easy task to take a badly infested field and keep it clean without great expense and effort, but after the first year it ceases to exist as a pest in a cultivated field, and the field may again be sown to hay or grain.

Higher land, unsuitable for beets, produces good beans and offers the same opportunities for cultivation and hoeing as sugar beets. One of the best examples of bean raising as a method of combating the thistle is on J. Rousse's place, situated in the very heart of the Russian Thistle district. He planted beans this year on a piece which was very badly infested in years past, and today it is practically free from weeds. By rotating in this way, and reclaiming his land he will soon have a clean place. Other farmers can do the same thing, greatly to their own profit.

Other local farmers have also demonstrated the practicability of crop rotations as a method for controlling this weed by planting not only beans, beets, and cultivated crops, but alfalfa as well. This crop, constantly irrigated and cut soon does away with the thistle.

Orchards demand repeated summer cultivations and give the best possible opportunity of getting rid of the thistle, though some young orchards have lacked proper care and cultivation. Here the weed is never able to do material damage, except by sapping the ground.

I should recommend, then, that the system of rotating crops be employed by all farmers whose land is capable of such a method, which includes practically all of the now infested area.

On Highways.

It is useless to clean up infested fields if the weeds are allowed to grow and mature along the public and private roads. Such is the case at present ,along private roads.

The Southern Pacific R. R. Company has also co-operated in the work and has given orders to keep it from its tracks. In the barnyards, corrals and fence corners the weeds must be removed to prevent reseeding the fields.

Co-operation and Concerted Action Necessary.

The one important factor necessary in the eradication of this pest is concerted action of all the farmers. It is useless for one man to clean up his fields if the first winter wind is going to bring a host of rolling thistles from his neighbor's place to reinfest his own. Such is too often the case.

Important.

1. Let no weeds seed.
2. Get grain in early.
3. Fire stubble, if possible.
4. Plow immediately after the crop has been harvested.
5. Plow shallow.
6. Destroy the weeds now before the seed ripens.
7. Plant cultivated crops or alfalfa.
8. Co-operate with your neighbors and with the county commissioner.

The Citrus Convention with a Message

Growers of California are asking, "At what age shall the Orange Tree be Oslerized?"

FROM ORANGES TO SNOW IN THE POMONA VALLEY.

THE conservation of citrus orchards, or the preventing of decadence of trees which have reached the age of fifteen to twenty-five years, was the topic considered at the Pomona meeting of citrus growers. The discussions brought out many divergent reasons for trees ceasing to bear profitable crops. Among them are:

Natural stage of old age where the only remedy is removal and planting of new trees. Heredity. Seed and buds not selected with idea of longevity. Variations or mutations of buds. Overworking trees, then neglecting them. Lack of proper pruning to admit air and light to all parts. Suckers allowed to grow up through top, taking sap and ultimately smothering out lower parts. Lack of fumigation or spraying, permitting fungous and insect troubles to lower vitality. Too much spraying, especially with distillate. Covering leaves and clogging pores with road dust or dust from cement works or factories, thus preventing proper elaboration of sap. Soil unfit when tree was planted or made unfit for best work of roots by improper tillage. Too little humus. Too much nitrogen. Lack of aeration which might be corrected by deep tillage or tile draining. Too much subsoiling or disturbing of roots lessening power of securing nourishment. Too shallow culture permitting formation of hardpan or plow-sole for which the remedy is sub-soiling. Sub-soil too close in texture and holding too much moisture, or else too open which permits loss of water and fertility. Deposits of silt about tree making impervious sediment which creates unhealthy conditions. Trees set too deep. Trees not set deep enough. Too many trees to the acre, preventing access of light and air. Lowering of vitality by frost or continued cold.

Hulled
Melilotus Clover

Produces 15 to 20 tons green manure to acre. Has heavier root system than Burr Clover or Vetch. At the prices we quote it is the cheapest of all. Write for prices and pamphlet entitled,

"Melilotus Clover, the Great Cover Crop."

We are headquarters for Vetch, Field Peas and all other cover crop seeds. Write for prices.

Longer Life Through Seed and Bud Selection

Address by William Wood of Whittier before the State Citrus Growers Convention

IT has been said by many growers who have observed the growth and fruitfulness of citrus orchards in Southern California in the past twenty-five or thirty years that citrus orchards of the more recent planting do not thrive and yield as good crops as did orchards of the first planting —age of orchards being equal; that citrus trees of the first planting were not nearly as subject to disease as they have been in the later planted orchards; that, in orchards of the more recent planting, many trees begin to decline and the fruit to deteriorate at a much earlier age than did the first orchards; and that this decline and deterioration has been quite noticeable in many of the later planted orchards where the natural conditions were apparently good, and in many of these orchards the care has been better than was given the earlier planted orchards.

If these statements are true, what has brought about so radical a change? I do not think such a change should be laid to any one condition. It must be remembered that citrus orchards in the past thirty years have been planted on all kinds of lands, often where the conditions were very unfavorable, such as heavy soils underlaid with clay or hard pan and with poor drainage; soils underlaid with sand or poor gravel; soils that had been cropped and impoverished with wheat, corn, barley, etc.; soils that never had sufficient of the needed elements to sustain an orchard for a great length of time. Improper irrigation, such as holding water in basins, allowing the soil to bake under and about the trees; allowing the trees to suffer for moisture for a long time and then forcing them with water. Under such treatment I have known orchards where many trees soon develop gum disease.

Heredity a Factor.

All these are conditions unfavorable to the healthfulness of the orchard trees, but back of all this, may there not have been a hereditary weakness transmitted from the parent tree that has made a large per cent of the trees susceptible to such diseases as we find common in the orchards of today, and must we not look for some improvement from carefully selected seed?

Under the conditions I have named, we often find good, healthy trees yielding good crops of fruit, while the nearest trees growing under the same condition are weak, diseased, dead or dying. In such a case it would seem that some trees are weakly constituted and are more susceptible to disease than others. Now when we consider what kind of seed stock trees are grown from, is it any wonder why we have so much weakness and disease in many orchards?

Selecting the Seed.

In laying the foundation for a citrus orchard, we cannot lay too much stress on the importance of the careful selection of seed. I believe the seed should be one of the first considerations. If we save seed from fruit known to have grown on good old healthy seedling trees, we may reasonably expect much stronger, healthier, and long-lived citrus orchards as the result. It may be said that there is no certainty that the trees will all be like the parent trees because of the cross polenization from the weak trees. From my own observation I have found that this is only true to a very slight degree and that seedling orange trees produce after their kind almost invariably.

Let us compare the foundation we have used in the past twenty-five years with that known to have been used in the first orchards planted in California. I have not much data as to what kind of orange trees the seed plants were grown from, but I have good reason to believe that the seed did not come from the poorest fruit that grew, as has been the case in the later planted orchards of California; but rather from decayed oranges such as were found in the markets of San Francisco, which was probably the best fruit grown in the Hawaiian Islands, or the countries from which the fruit came.

Seed from Any Old Fruit.

I think that every one who has been connected with the growing of orange seed-bed plants will agree with me that all sweet orange seed grown in the past twenty-five or thirty years have been propagated from poorest seedlings, budded fruit, and a large portion from sick and weak trees. I think I can make myself better understood by explaining how orange seed is obtained.

In the past thirty or thirty-five years nearly all orange seed has been gotten from cull seedlings or any oranges that have seed in them, such as are thrown out at the packing houses for culls. A large per cent of these culls came from sick, diseased, weak and dwarfy trees. If there are any such in the orchards, the fruit almost invariably is picked from them and brought to the packing houses with the best. When the fruit is sorted, a very large portion of this fruit from the sick or diseased trees is thrown into the culls, consequently a large per cent of the seed comes from the very poorest and weakest trees in the orchards.

Now if this weakness is hereditary, and I believe it is to quite an extent, what may we expect if we go on planting trees from such stock? Who of you would knowingly plant the poorest seed of grain, potatoes, corn or anything except oranges? Why then should we not be just as particular, and more so, in selecting orange seed?

It has been said by many California growers that sour stock is immune from gum or foot rot disease. From my own observation I have found this not the case. I have seen a few cases where sour stock gummed quite badly. I have also had quite a bad case of foot rot in my seed bed nursery. In this case the condition was caused by heavy soil and too much water, and the root rot affected both sour and sweet stock the same.

In the past three or four years seed of the wild sour orange trees of Florida has become generally used by the nurserymen of California.

I understand the demand for this seed has been so great that all of this kind of fruit has been used for seed. Sour stock as a healthy long-lived stock to bud onto has been very highly recommended by Florida growers.

I believe this stock is much less subject to gum and root rot diseases than such sweet stock as we have been using, possibly because the seed has been saved from all of the fruit and not from all the poorest as has been the case with the sweet stock seed used.

I believe if all of our seed was saved from the best trees instead of the poorest, we would have a much larger per cent of good, healthy, long-lived trees. The picking out of good old healthy trees to save seed from applies to sour oranges as well as to sweet.

I am appreciative of the fact that the problem of decadence in orange tree production is is fraught with influences from many sources; the one I have written on being only one. In spite of that, however, I believe it important, and can only hope that others will follow up the lead.

Orange Groves of Pomona Valley as Seen From the Hills of Ganesha Park.

In Prof. Quayle's correction of an article on spraying for pests of the apricot, he did not take into account the fact that Mr. Essig wrote it with an idea to Ventura county conditions only, and the "Santa Clara Valley" mentioned was not the Santa Clara Valley of Santa Clara county, but the little valley in Ventura county along the Santa Clara river. It was a case merely of duplication of names which is quite common in our state and always confusing.

James Boyd of Riverside, has a peach tree which is 37 years old and which is bearing an exceedingly heavy crop this season.

Decadence of the Navel

A Pomona Orange Packing House. Courtesy Pomona Board of Trade.

WISHING to please her guests at a feast, Juno, queen of heaven, told her attendants to bring of the products of the field. Of all the choicest, the golden apples brought by the goddess Pomona were the most acceptable. These Juno commanded to be planted and cared for by the Hesperides, but so attractive were they to both gods and men that the trees were constantly despoiled, and finally to protect the priceless fruit a hydra-headed monster was placed in the garden. When one of this creature's heads was cut off many others grew from the stump, so the apples of the Hesperides were most effectually guarded until Hercules by the aid of Atlas, overcame the hydra and carried off his golden spoil.

This myth was the preface to the address made by Prof. Elmore Chase at the citrus fruit growers' convention at Pomona last Tuesday and Wednesday, September 13 and 14, and aptly illustrated the situation confronting citrus growers. For a quarter of a century has been proved the ability of California soil and climate to produce apples of gold which have been turned into harder gold for the producers, but for the past few years those who have worked faithfully with the eariler planted orchards have found that some monster has taken possession of their groves so that they can no longer grow their fruit with the profit formerly secured. Some of them have said that these trees have reached an age where they can no longer bear profitably. Oranges in Florida and in Italy are known to live to an age covering scores or even hundreds of years. But California's experience has been almost exclusively with the Washington navel, so this age limit is as yet a conundrum,—though there are some of our closest observers who say that at fifteen or twenty-five years the profitable bearing age is passed and orchards must be taken out and replanted.

Decadence but not Death.

This was not the general opinion at the Pomona meeting, however. In fact, by a series of resolutions passed unanimously, the feeling was expressed that there are yet many years of use for these old trees providing we can solve the question of supplying proper conditions to renew their life. It was not the intention of calling the convention to solve this question immediately, rather it was realized to be too big to handle so quickly. The help which the citrus growers have received already from trained investigators encourages them to think that when this present problem is taken up intelligently a solution will be reached. Resolutions passed called for the appointment of a committee of seven orange growers to encourage investigations by securing the aid of the U. S. Department of Agriculture, the State Experiment Stations, and any other forces which might aid in determining a remedy. The committee is to be appointed by State Horticultural Commissioner Jeffrey with the aid of a committee of three named by the convention, A. F. Call, P. J. Dreher, and C. C. Teague. Thinking it might be desirable to include some of these three in this committee of seven, the convention ordered that the state commissioner should be at liberty to appoint them should he deem it wise.

A Hummer.

The convention was the largest gathering of fruit growers ever held in this state. As an indication we may say that at the opening session on Tuesday 610 people were in their seats, at a later meeting 725 were counted and it may be added that a brighter and brainier bunch never met to discuss questions of fruit culture. We believe one reason for this unusual attendance was the fact that one specific and vitally interesting topic was set before the growers. Heretofore a state fruit growers convention has been announced simply as "A Convention." Fruit growers were present not only from the seven citrus growing counties of the South; but Tulare also sent a good sized delegation to enter into the discussions as did Sacramento county.

Reasons for the Meeting.

Touching upon the meeting and the reasons for its call, Commissioner Jeffrey said:

"The objects of this meeting should be:

"First, to determine if there is serious deterioration of the citrus fruit trees or a marked decline in the productiveness of our older groves which have been given proper care.

"Second, if it is found that our orchard conditions are not what they should be, we should get all possible information before the convention relating to the causes of unfruitfulness and decadence, and from this information determine upon definite lines of scientific research for the future and designate its character and scope. Also by discovery to the best of our ablity of the causes and effects of decline, to afford some present relief to the growers whose trees are not doing well.

Experts' Aid Demanded.

"Third, having decided upon definite subjects of research, to take steps to secure scientific experts equipped for long and patient investigation.

"Fourth, from the results of this conference we should make broad and positive declarations upon the present status of the citrus industry, that shall set forth to the public a correct view of the business from all sides.

Excluding the esason of 1908-9, there has been no material increase of citrus fruits during the last ten years. The total output in ten years ending in 1908 was 248,206 carloads, an average of 24,820 carloads per year. In 1900-1 the crop was 25,000 carloads. The 30,000 mark has been reached but three times. By all rules of natural increase, the output should have reached perhaps 50,000 cars long before this. And it is a fact that low yield often means inferior quality and abnormal sizes of fruit.

"It is not foreign to the purpose of this meeting to state that our strongest claim to a protective tariff lies in our ability under protection to supply the markets of North America with cheaper and better citrus fruits than would be supplied by foreign growers should the California industry be crippled.

"No one must get the idea that the industry is in the slightest danger of collapse. New methods of marketing, the splendid productiveness of many of our old orchards and the planting of new orchards, in soils best adapted to citrus fruits and cared for in the light of our long experience, insure the future of the industry. But some of the best orchards in the state are becoming unproductive, suffering from decadence or at least stagnation. Experts are complaining that they do not know how to meet these adverse conditions of later cultivation."

There were a few of the ever ready who advanced solutions of the problem; some of these may be seen in all their contradictions on the cover page of this issue, and even this list does not give them all.

Some Features.

Mr. Wood's address, quoted on the preceding page, shows how one of the questions discussed was handled. Many of his hearers thought his suggestion of the proper selection of seed and buds the more important answer to the question. Other addresses touched upon soil conditions, upon pruning in its varied phases, etc. Mr. Chas. R. Paine of Crafton, spoke as he has before on the importance of admitting light and air to all parts of the tree. His address will be given almost in full in a later Cultivator. Dr. J. Eliot Coit discussed the relation of bud variation, or, more properly, bud mutation, to decadence. Full report of this will appear in the columns of The Rural Californian for October.

The only failure of the program, and one which was much regretted, was in not being able to hear from Mr. P. J. O'Gara, formerly pathologist in connection with the Department at Washington, but more recently employed by the fruit growers of Hood River, Oregon. Prof. O'Gara was to discuss frost and its effects on the permanent health of citrus trees, but his recent change from the Department to a position with the apple growers of the North necessitated giving up his trip to California.

Generally the impression prevailed that we must look to the soil and its conditions, both mechanical and chemical, for the solution of the problem. This subject was discussed by Prof. Elmore Chase of Fairoaks, and his address will be given later. Prof. Ballard of the Bureau of Plant Industry, Dr. Snowden, Soil Engineer, of Los Angeles, and Mr. Macoun, assistant superintendent of the Arlington Heights Orchards at Riverside, were also among the prominent speakers. Mr. Macoun's belief is that aeration through deep culture, and the working of humus into the soil to prevent formation of plowsole or hardpan are the principal remedies of the condition discussed.

No Royal Road.

An excellent spirit prevailed and every address was of great value. The one who went with his question as to how his deteriorating orange tree may be renewed, possibly went home disappointed. There was no royal road outlined, through many hints were given which with common sense application will be of great value.

Generally the convention looked at the larger aspects of the industry and set in motion that which will accomplish results.—C. B. M.

CONVENTION NOTES.

Pomona proved herself a most entertaining hostess. The convention lasted only two days, which did not allow of any extended social functions, but early on Wednesday auto-

Continued on page 287.

Frost --- Methods of Protection

The time for **Decision** and **action** has arrived. What is the grower of citrus fruits in Southern California going to do to protect his orchard the coming season against frost?

He must either equip to protect, or take chances. The lesson of last year to those who took chances was an expensive one, excepting, of course, those who escaped.

With those who have decided to protect, it is simply a question of method, which includes the questions, also, of efficiency and cost.

Three materials, only, for the purpose are available in Southern California, namely, **coal, oil** and **smudge fuel.** By "smudge fuel" we mean shavings and fruit pits saturated with petroleum, to be burned in a self-ventilating stove.

Coal is effective for the purpose, and unobjectionable, but very expensive. To burn coal means one hundred coal baskets to the acre (assuming 100 trees to the acre), one hundred bundles of kindling, one hundred careful fillings of baskets, coal at $10.00 per ton, or more, and an army of men to start the fires and keep them going. This is the most expensive method of protection.

Oil is less expensive than coal, but much less effective. It will produce smoke, but not enough heat. It is also objectionable in that it smuts the fruit. Smoke alone will never provide protection against frost. It has been tried for years and always without success. It is useful only when a saving degree of heat is generated, but heat is the saving agent.

Smudge Fuel is at once the cheapest and most effective of the three materials named. When made of light oil, fruit pits and shavings it gives great heat, all the smoke required, and does not smut the fruit.

A gallon of oil, when burned alone, will protect one tree four hours, and no longer. That same gallon of oil, with pits and shavings added, will make smudge fuel enough to protect four trees for from five to six hours, and generate more heat than the oil alone. These statements are based upon actual competitive tests.

In addition to the question of method of protection, the grower must make up his mind to **be ready** when frost arrives. In this connection procrastination, and a disposition to gamble on chances, are the manifest faults of too many growers. "Fire up or freeze" is the lesson of last year in a nutshell.

We cannot make deliveries of fuel and stoves in time to afford protection if orchardists, as many have done heretofore, wait till the eleventh hour. If orders are received now, or soon, we can deliver the goods in ample time—payable, of course, after delivery. Write for order blank and any further information that may be desired.

Prices: Smudge Fuel (sacked), $10.00 per ton in car lots (minimum car 15 tons); Stoves 45 cents each, both F. O. B., Los Angeles.

Deciduous Fruit Culture

APPLE AWARDS AT WATSONVILLE.

OFFICIAL advices received by The Cultivator give every assurance of a great exhibit of apples at Watsonville, October 10 to 15, and also a wide and keen interest in the event among all classes of fruit growers. For it should be remembered that the coming event is not merely local in character, but has been arranged for on sufficiently broad lines to give it state importance. This is strongly indicated in the premiums that are being offered, which include awards on whole carloads, with many for exhibits of smaller dimensions. The following are the more salient features in the way of premiums, honors, specials, etc.:

Class 1, Carload Lots—Best carload each variety, gold medal; second, silver medal.

Best car mixed varieties, gold medal; second, silver medal.

Best carload at the show, special sweepstakes, gold medal.

Class 2, 100-box exhibits—Best 100 boxes, single variety, gold medal; second, silver medal.

Best 100 boxes mixed varieties, gold medal; second, silver medal.

Class 3, 10-box exhibits—Best ten boxes each single variety, gold medal; second, silver medal.

Best ten boxes, mixed varieties, gold medal; second, silver medal.

Class 4, 5-box exhibits—Best five box each single variety, gold medal; second, silver medal.

Best five boxes mixed varieties, gold medal; second, silver medal.

Class, 5 single box exhibits—Best box, each single variety, gold medal; second, silver medal.

Best single box, one variety, exhibited, sweepstakes, gold medal.

Class 6, plate exhibits—Premiums in this class blue ribbon first, red ribbon, second, sweepstakes prize a cup.

Class 7, evaporated apples—First, gold medal; second, silver medal.

Class 8, factory products—First, gold medal; second, silver medal.

Class 9, canned apples—Same premiums.

Class 10, cold storage apples—Best display grown in 1909, gold medal; second, silver medal.

Futurity prize, best exhibit of apples grown in 1910, to be exhibited again in 1911, special gold medal.

Class 11—Domestic by-products—First, blue ribbon; second, red.

Class 12, appliances and auxiliaries—No premiums.

Class 13, largest apple—Cup, suitably engraved.

Class 14, feature exhibits—First, $100; 2nd, $75; 3rd, $50; 4th, $25; 5th, $15; 6th, $10.

Other prizes have been offered by outside parties and it is expected many more will be offered.

It is also hoped that a substantial sweepstakes prize will be offered for the sweepstakes car. If it is possible to induce the parties before whom the proposition has been placed to offer a cash prize of $500 or more, the committee recommends it be made a condition that this car be taken to Chicago and exhibited before the Irrigation Congress which meets in November.

Tulare County Fair is declared off for this year.

SOIL CONVENTION.

On Monday morning, October 3, one of the most important conventions which will have to do with agriculture will begin its sessions in the Chamber of Commerce building, Los Angeles. Two noted speakers, Dr. F. H. King of Wisconsin and Dr. Cyril G. Hopkins of Illinois, will give addresses twice daily from Monday morning till Friday afternoon. Representative Californians will preside each day.

On Monday Dean Wickson will preside and deliver the opening address. Dr. Hopkins will lecture in the morning on "Soil Fertility in Relation to State and National Prosperity."

In the afternoon Dr. King will lecture on "Physical Features of Soils which Influence their Ability to Feed Crops," and Prof. J. H. Norton of Riverside will speak of the "Management of Citrus Orchard Soils During Autumn and Winter."

Tuesday, Oct. 4—Prof. A. J. Cook presiding. Morning:

"Factors in Crop Production," Dr. Cyril G. Hopkins.

"The Soil as a Culture Medium; the Relation of Temperature, Moisture and Air, as well as Plant Food, to Bacterial Development," Dr. C. B. Lipman.

Afternoon:

"Development and Maintenance of Good Physical Soil Conditions," Dr. F. H. King.

"The Management of Citrus Orchard Soils during Spring and Summer," Professor J. H. Norton.

Wednesday Oct. 5.—Mr. C. C. presiding.

Morning:

"Established Principles Relating to Soil Improvement," Dr. Cyril G. Hopkins.

"The Relation of Soil Bacteria to the Nitrogen Question; Ammonification, Nitrification, Denitrification," Dr. C. B. Lipman.

Afternoon:

"Functions and Duty of Water in Crop Production," Dr. F. H. King.

"Soil Management of Citrus Orchards during Spring and Summer" (Continued from previous day), Professor J. H. Norton.

Thursday, Oct. 6.—State Commissioner of Horticulture, J. W. Jeffrey, presiding. Morning:

"The Application of Science to Local Soil Conditions, Dr. Cyril G. Hopkins.

"The Relation of Soil Bacteria to the Nitrogen Question; Nitrogen Fixation; Symbiotic and Non-Symbiotic," Dr. C. B. Lipman.

Afternoon:

"Conservation and Application of Water in Crop Production," Dr. F. H. King.

"The Soil Work of the Citrus Experiment Station at Riverside," Professor J. H. Norton.

Friday, Oct. 7.—Dean Wickson presiding. Morning:

"What kind of Soil Work the State Experiment Station should Undertake," General Discussion led by Dr. Hopkins.

Reports of Committees, etc.

Afternoon:

"Soil Bacteria in Relation to other Plant Foods in the Soil; Relation of Manures and Fertilizers to Soil Bacteria," Dr. C. B. Lipman.

General Discussion.

PRUNING THE APRICOT.

Touching upon apricot pruning in California Fruits, Mr. J. B. Neff, of Anaheim writes:

"Pruning the apricot requires some skill and considerable judgment; which can only be formed by experience and observation of the habits of the tree. Trees of four to five feet in height are preferable for planting, and when planted should be trimmed to a single stem and cut off at eighteen inches from the ground. These will throw out shoots vigorously and frequently two or three shoots from one bud. These shoots should be thinned out, leaving not more than four or five, no two of which should come from one bud, nor be directly opposite. The first shoot

Plows

You don't buy a plow for speculation—you want it to dig dollars out of the ground with it.

A good plow means good work; good work means more dollars.

No one ever heard of a better plow than the Deere—because there is no better plow.

Plowing is a steady, all-day pull; if the pull is too heavy the team is soon jaded and loses its proper capacity for work.

Deere plows do not "drag" the horses. They pull light because they are shaped right—easily handled because made right—outlast others because the best materials that can be put into a plow go into the Deere.

Made in styles for every plowing purpose.

Deere Cultivators, Deere Harrows, Deere Cotton Tools and all other Deere implements are of the same high class.

Harrow While You Plow

With the world-famous Kramer Rotary Harrow Attachment. Awarded Gold Medal and Diploma at A. Y. P. Exposition, Seattle. Also Diploma by Dry Farming Congress Convention. First on the market. All others are imitators. Over 50,000 sold.

The Kramer Attachment is recommended by the leading Departments of Agriculture, and is so light-running that your team will never notice the additional draft. Can be attached to any gang or sulky plow. Mulches the ground to any depth and produces the Ideal Seed Bed. Combines all the functions of Harrow, Packer and Pulverizer.

should start twelve inches from the ground, the others in such a manner as to divide the space and make the branches balance, leaving the top shoot to form the central part of the tree.

"It will be necessary to go over the trees several times the first year to remove shoots that may start where not wanted, but no general heading back should be done, as it tends to dwarf the tree; though if some of the limbs are making an overgrowth they should be pinched back to keep the head balanced.

"The pruning of the second year should be done in January, as the tree will not be dormant until then, if it has been kept in a thrifty condition. The first year's growth should be cut back to within five to ten inches of the body of the tree, and all forks should be cut out, even if it necessitates forming a new head, as it is much better to lose some growth on a young tree than to run the risk of splitting down when the tree begins to bear fruit.

"When the shoots start for the second year's growth, take off all that come on the under side of the limbs and thin to one, two, or three, as may be needed to balance the tree, bearing in mind that an apricot tree inclines toward the coast breezes in this locality.

"The second year will require much more attention than the first year, in order to keep off suckers and all lateral growth that may start on the under side of the new limbs, the obejct being to make the limbs grow as nearly upright as possible. The remark on heading back holds good for the second year also.

"The trees will become dormant earlier the second year than they did the first, but should not be trimmed earlier than December, and a month later is preferable, as the ends of the drying limbs are not exposed to the drying winds so long before the sap begins to flow and consequently will heal over better. The second year's growth should now be cut back to within fifteen to twenty inches of the old wood, except the central stem, which may be left twenty-four to thirty inches long, depending upon the number of laterals it may have thrown out. When the new shoots start they should again be thinned down to two or three inches on each limb, and all taken off that tend to turn down or out at right angles, but do not take off the fruit spurs.

"The trees will need to be gone over about three times before July to remove suckers and lateral growth that may start on the lower side of the limbs, as the tendency in the third year is to make an immense growth of downward laterals, and these must be taken off so as to develop wood that is to be left for fruit. If the orchard is on good land and has been properly irrigated and cultivated, the trees should now be large enough to begin to yield fruit. The object in trimming during the first two years and the first half of the third year has been to grow a vigorous upright tree, with strong limbs, capable of carrying a heavy load of large fruit, and to get the fruit as close to the body of the tree as possible.

"There will be a few specimens of the fruit the third year, and as soon as these are gathered the trees should be summer pruned for the first time, care having been taken that the land shall have been allowed to become moderately dry so that the trees may be partially dormant. If the downward growth of the laterals has been cut off, all that remains to be done is to cut off about one-half of all this season's growth all over the tree, using the same judgment as before with reference to prevailing winds and symmetry of tree. If this is properly done and water at once turned on the orchard, a new growth will be made and the fruit buds for the next year fully developed.

"The only pruning necessary in the following winter will be to take out any cross limbs and sprouts that may have been overlooked in the summer.

"After the trees begin to produce regular crops they will not grow so vigorously, and the numerous prunings of the first three years will not be necessary, as almost all can be done by summer pruning until the trees get so old that they need the old wood taken out. This can be more readily done without damage to the trees where from 24 to 30 limbs are grown, than in the old method of leaving only eight to ten large limbs.

"When it becomes necessary to take out old wood—as the best fruit grows on new wood—a few limbs can be taken out each year until a full top of new wood is again made.

Thirteen cars of Gravenstein apples were shipped from Sabastopol one day last month.

FALL CLIPPING INCREASING.

In most sections of the country the practice of clipping horses in the fall months is growing rapidly.

Perhaps one reason for this increase in clipping, since owners recognize its advantages, is the fact that it can be done very quickly and with little exertion through the use of the modern clipping machine. One large manufacturer makes a machine that is generally regarded as the best, is superior to anything else on the market and as this outfit complete, lists at only $8.50, it is no hardship for any owner to have one in his stable.

Malthoid Roofing

WATER PROOF MALTHOID WEATHER PROOF

Most roofing guarantees are a joke.
Experience teaches the longer a roofing is guaranteed to last, the poorer it is.

Manufacturers inexperienced in making roofings—without knowledge as to their dependability—without responsibility as to their own financial standing, will very often guarantee their roofing for any number of years simply to get the order.

The roofing generally fails and so does the firm that makes it and they never live to make good their guarantee.

Malthoid Roofing is made to make good and while its manufacturers guarantee it, their guarantee is unnecessary because the roofing in itself is sufficient to do all that is claimed for it.

For twenty-six years, the makers of Malthoid Roofing have made and guaranteed their roofing and not one single purchaser can ever say that this Company has failed to make good a guarantee.

You can depend upon the responsibility of the makers of Malthoid Roofing, and you will never have to bother about guarantees if you use Malthoid Roofing.

It's free

Send for it. A new and valuable book on the **"Care of Roofing."**

No matter what your experience has been or what roofing you have used, this book will enable you to take better care of it. Sent free.

Improved Babcock Tester

Babcock's Milk Tester, an extremely simple, light, compact and carefully designed apparatus, especially adapted for use in the dairy and also on account of its light weight to the Traveling Dairy Inspector.

The working parts are entirely enclosed in a handsome cast-iron case, and consist of but two cut gears, namely, bronze spiral gear and steel spindle with worm thread.

The Tester is fitted with swinging pockets and malleable iron head; it turns very easily without any vibration or jar and can be readily attached for operation to any table or bench. The bottles are perfectly horizontal when rotating.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE ORPHANS.

By Mrs. M. E. Sherman.

ON a farm it sometimes happens that the dam dies and leaves a baby colt of calf to be raised by hand. Raising a colt or calf is easily done if the dam lives long enough to start the little one to eating. The colostrum, or first milk of the dam is intended by its cleansing purgative properties to start the action of the gastric juices, as well as to cleanse the stomach and bowels of their tar-like substances. When this colostrum is lacking the young animal begins life at a disadvantage and must be helped by medicines in many cases. When the animal is twelve hours old, if no natural action has taken place from the bowels, then give a teaspoonful of castor oil mixed with a tablespoonful of olive oil in a teacup of warm water. Follow this up **at once**, with an enema of half a pint of warm water containing a teaspoonful of glycerine. After the bowels are acting freely begin to feed milk.

The Colt.

Cow's milk is richer in butter fat and poorer in sugar than mare's milk. It is necessary to modify it for feeding a colt. A pint of warm milk has one-quarter more hot water added and a heaping teaspoonful of cane sugar. A shallow pan is the best for feeding. When a pail is used the colt will draw some up his nose and that terrifies him beyond all reason; I have known colts that never seemed to recover from this terror. A colt is more timid than a calf and more liable to nervous shock. During the first four weeks a colt should be fed every four hours, if possible, though many omit the feeding in the middle of the night. After he is a month old, three times a day will carry him along nicely. Now begin to add a little bran to the milk, a mere pinch at first, and increase it so that by the end of the month he is receiving a teacupful three times a day. Then begin to add rolled barley so that at five months old he is getting half a teacupful with a teacupful of bran. Then begin to give him water in the milk until he has only the moistened meal.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Pets.

These orphan colts become great pets, and also great pests, around the barn. We find it best to put them with the cows on this account and they come in and out with them after they are two months old. When left around the horse barn they have a way of nipping the older horses that often results in their getting kicked, and then too, they get into the stalls with some good natured animal and gorge themselves on the rolled barley until it sometimes proves fatal. These pet colts are very hard to break and have little regard to the wishes of trainers. They often prove hard to confine, as they become wise on the fastenings of gates and doors. As soon as the little fellow has learned to eat hay and to graze freely he is better off to be turned out with the other horses,. The grave old mares certainly give the youngster good council and he forgets his human friends rapidly and becomes shy with them. He is easier handled later on if not too familiar with the human race.

Orphan Calves.

While the same treatment would be equally good for the calves we feel that they rarely get as much care as the colts. Sentiment probably has to do with it, for on a ranch the men will feed the horses and let the cows starve. When there is a scarcity of milk the calves may be raised with very little hay by the use of hay tea. Gather the leaves that have fallen from the alfalfa hay into the bottom of the mow. Put into a gallon of water a quart of the loose leaves and let them come to a good boil, then cover the boiler and place on one side where it will steep for half an hour. Pour off the liquid portion which should have the color of black tea. This substitute for milk is added gradually to the skim milk after the first three days. When the calf is a month old add gradually to the tea a little cooked bran or oil meal gruel. This must be well cooked and stirred into the hay tea. At first a good teaspoonful is enough; then this can be increased to a teacupful at each meal. Hay tea is one of the culture mediums for bacilli and must be fresh or it will play the mischief with the calves.

Hay Tea.

It is not always convenient to make this every day, so it may be made in larger quantities and canned for use. Twelve two-quart Mason jars are filled with the tea while it is boiling hot and screwed up carefully. At feeding time in the morning two jars can be heated and one fed while the other is packed into a hay lined box down at the barn for the evening feeding. The jars are heated by putting them into a boiler of hot water and are not opened until ready to use. When the calves are six weeks old, they may be coaxed to eat a portion of their food dry. A small low feeding trough is supplied with a mixture of one quart of rolled oats, one quart of corn meal, four ounces of oil meal, one tablespoonful of blood meal, one tablespoonful of salt, two tablespoon-

fuls of baking soda, and one of ground anise seed. This makes a good growing feed for the calves, and the hay tea may be dropped if there is any pasture for them to nibble at the same time.

Richer Ration.

Sometimes this ration is a little too narrow for calves that are desired for show animals; it may be modified as follows. (We think this is better for winter feeding at all times). One quart of bran, one quart of cornmeal, one quart of barley meal, one tablespoonful of blood meal, one of salt and two of baking soda. Add the anise if there is any lack of appetite in the band of calves.

The barley meal is secured at the horse barn by shaking it on a sieve and taking the fine portion for the calves, leaving the coarser parts for the horses to eat.

LARGE BLACK HOGS.

By G. E. Morton, Colorado Agricultural College.

The Large Black Hog, an English bacon breed, is little known in this country. There are only four herds, so far as is known, in the United States. They are a long, deep bodied, narrow hog, with enormous drooping ears. They are not prepossessing in appearance, but their great fecundity recommends them to corn belt farmers. A sow shipped recently by the Colorado Agricultural College to Mr. J. H. Decker, of Calloway, Neb., farrowed fifteen strong pigs soon after arriving. The pigs are strong and active even though farrowed in the coldest weather. Litters of the Large Black breed have pulled through when both Poland China and Tamworth pigs died as the result of the thermometer dropping to eighteen below.

As a bacon breed the Large Black has a distinctive advantage in an unusually light shoulder. The carcass is rather limp and unprepossessing in appearance, but the bacon cooks as crisp as any. The bacon is rather a surprise upon the table, after one has seen the carcass, The meat of the carcass is rather colorless.

A Large Black carcass was entered in the carcass contest at the January, 1910, Western Live Stock Show, in Denver, and elicited rather unfavorable comment from the judge, who was a prominent retail butcher of Denver. Too much stress should not be laid upon this, however, as our western markets are notoriously lard markets.

A cross of Large Black and Poland China proved fairly satisfactory. I believe the Large Black should prove useful by infusing new prolificacy into herds of grade Poland Chinas or Berkshires that have run out through excessive corn feeding.

DISTEMPER IN HORSES.

Distemper, or strangles, is a disease principally affecting young horses. It is due to a germ belonging to the streptococcic group. The disease is accompanied by high fever, catarrhal inflammation of the mucous membranes, especially of the nasal passages, and as a result of this condition, a discharge from the nose. There is a swelling of the lymph glands under the jaw, which later results in abscess formation.

A horse with distemper can communicate it to a healthy one.

The germs are found in the discharge from the nostrils and in the pus from the abscess which forms under the jaw and later breaks.

The majority of cases of distemper occurs before the age of five years.

The constitutional disturbances caused by the shedding of the teeth, and cutting same, as well as impure air in poorly ventilated stables, overworked and poorly fed animals, are factors that weaken the resistance and make infection possible to produce the disease.

The disease is more common in the spring and fall of the year, particularly the former, on account of the chill received as a result of the sudden changes at these seasons of the year.

The disease can also be transmitted from dam to offspring through the milk.

The animal usually develops the disease in from three days to three weeks after being exposed to the contagion.

Animals affected with distemper should not be sold. Young animals should not be brought in contact with those affected nor watered out of the same bucket, nor come in contact with any other property until it has been thoroughly disinfected. An animal should not be castrated while suffering with strangles.

A vaccine made from the specific germ causing this disease is very useful in combating distemper, both as a preventive and as a cure, and promises to be of as great value as the antisuppuration vaccine made from the germs which causes poll evil, fistula and wound infections.

Like the antisuppuration vaccine, to get the best results it must be used by one who is trained in the diseases of the lower animals and understands the use of vaccines on same. It is therefore advisable to have it used by a competent graduate veterinarian. —B. F. Kaupp, Colorado Agricultural College.

DID YOU READ IT?

In Hoard's Dairyman, in the report of the meeting of the Maryland Dairyman's Association, Mr. C. B. Lane said this:

"There are three classes of cows: —those that eat food and produce beef from it; those that eat food from which they produce milk; and those that eat food and the Lord knows what they do with it. We must have better cows."

Now the question is, in which class do your cows belong?

"The truth is, no one man can say he had more to do with the formation of the Poland-China breed than another. It was the result of the labors of many. It grew out of the introduction of the China hogs by the Shakers of Union Village, Ohio, their crossing with the Russian and Byfield, and the subsequent crossing with the Berkshires and with the Irish Graziers. After 1841 or 1842, these breeds ceased to exist in either Butler or Warren counties and have had nothing whatever to do with the Poland-China breed for the last 34 years." Controversies as to the precise crosses and by whom and under what particular circumstances they were made, prior to the middle of the last century, to form the breed, may interest a few; but what is vastly more important to the practical swine breeder is the fact that there was produced a race of swine now bearing the name of Poland-China that has been able to hold its own for three-fifths of a century as the most popular and most widely distributed pork-making machine in the foremost pork-producing region of the world.—From Coburn's "Swine in America."

Sound Separator Logic

So many claims are made by competing separator manufacturers that it may seem difficult to decide which machine will give you the best service.

Here is just one fact that it will pay you to keep in mind:

De Laval Cream Separators

are used exclusively by 98% of the world's creameries.

There can be no better recommendation for the DE LAVAL than the fact that the men who make the separation of milk a business use the DE LAVAL to the practical exclusion of all other separators.

The more you come to know about cream separators the better you will understand the superiority of the DE LAVAL.

The Ornamental Garden

ALKALI RESISTANT ORNAMENTALS.

SOME of the richest land in California is tinged with alkali, sometimes to the destruction of all vegetable life, sometimes to only a limited extent which prevents some trees from growing. Those having homes or grounds located on such soils, and wishing to give as much beauty to them as possible, are perplexed as to what plants will succeed in alkaline soil. Mr. O. M. Morris of the Morris & Snow Seed Company of Los Angeles, has furnished to us the following list of shrubs and trees which take kindly to such locations. We hope this will be of value to many Cultivator subscribers.

Acacias.

The acacia family is one of the largest in the vegetable kingdom. Bailey's Cyclopedia catalogues 53 varieties and gives a supplementary list of dozens more. They grow of all sizes from small shrubs to large forest trees. Many are gorgeous in flowering. Desirable varieties which will stand alkali are:

Armata or Kangaroo Thorn, a shrub which grows from six to eight feet, said to be an excellent hedge shrub with magnificent spring bloom, and as with other acacias, of course, yellow.

Latifolia, growing to the height of 25 feet or more. It is one of the most popular trees in Golden Gate Park, San Francisco. There it has been planted in the sun where the wind is very strong, and does exceptionally well, even down the slopes of the hills and to the edge of salt water.

Pycnanthea, a 20-foot tree.

Seligna, growing from six to 20 feet. It has bright yellow flowers.

Casuarina.

Sometimes called beefwood or she oak, another Australian tree and one of remarkable beauty. Bailey's Cyclopedia says: "It will grow well in brackish and alkaline soil and is especially valuable for holding seashore sands from drifting. It is propagated by seeds and cuttings. It takes its name 'beefwood' from the bright red, beefy appearance of the wood when cut. The branches are long and slender; wood very hard and brittle. The name 'casuarina' is from casuarius (cassowary) given to it because of the resemblance of the branches to feathers. The tree has been known in Australia to grow as high as 150 feet, but 50 to 80 feet is nearer its growth in this state."

Pittosporums.

Pittosporum comes from the Greek meaning pitch seed, because of the resinous coating over the seed. There are 100 species, most of them hardy, evergreen shrubs, though some grow to be 50 feet high. One Pittosporum undulatum (Victorian box) in Singleton Court, Los Angeles, is 28 years old and something over 25 feet in height. The branches are as broad spreading as the tree is high.

Melaleuca.

There are more than one hundred species to be found in this family. Like the casuarina, it is valuable as a sand binder. The tree will thrive in very salty ground and water. It is said to be a corrector of fever conditions. The wood is close-grained, hard and durable. Trees grow from four to 50 feet in height.

Eucalyptus.

The swamp mahogany and a number of others of the eucalyptus family will stand alkaline conditions.

Salt Bushes (Atriplex.)

Several varieties will stand alkaline conditions. They grow from three to ten feet high.

Cassia.

One of the leguminous families in which there are several hundred herbs, shrubs and trees. The cassia tree grows about ten feet high.

Monterey Cypress (Cupressus Macrocarpa.)

This is a native of the state, growing from 50 to 70 feet in height, often used for hedges and kept suppressed, but under these conditions is not proving to be long lived, and its use as a hedge plant has been largely discontinued.

Monterey Pine.

This is a very beautiful tree and grows to a height of 70 feet.

Cocas palm.

One of the very handsomest palms grown in California, the plumosa being especially fine. Rather slow growing, but well worth waiting for. It reaches a height of 30 to 40 feet.

Washingtonia Palm.

The most common of the fan palms are the Washingtonia filifera and robusta. Mr. Morris speaks of these as attaining a height of 30 to 50 feet, but we are sure we have seen robustas much higher.

Tamarix.

A very ornamental deciduous tree of pyramidal habit, growing to a height of 20 feet or more. Two varieties are especially good, Gallica and Africana. This tree will also stand coast influences and quite salty lands.

Fabiana.

A shrub from South America, dwarf in habit, though some varieties grow to 20 feet in height. It will not stand low temperatures. Produces pure white tube-shaped flowers in great profusion, and when in bloom is a most beautiful shrub.

Veronica.

The Veronica is a shrub growing some four or five feet in height. Imperialis and Traversii are the varieties more largely grown though there are dozens in the family.

Caesalpina.

There are 50 members of this family, ranging from shrubs to the taller trees. Valuable for tanning material and dye-stuffs. Has very showy flowers. One of the best varieties for alkaline situations is coriaria.

Algaroba, St. John's Bread.

The Algaroba grows to a height of 130 feet.

Arundo Donax.

This is a perennial grass which resembles bamboo. It grows as high as 15 feet. It is found all along the streams and even dry washes in California. It is sometimes called the giant reed.

Vetch

(Vicia Sativa)

The most valuable plant for cover crops now being used in California. Should be sown in September or October, if possible, and plowed under early in the spring. Also very valuable as hay and when so used should be sown with oats or barley to hold up the vetch.

Avicennia.

Extra good on salt, muddy flats, grows to be a large tree.

Callitris.

A conifer, a handsome timber tree from Australia.

Coccoloba.

Shrubs growing 6 to 10 feet.

Albizzia.

A leguminous tree 30 feet in height. Generally classed with acacias. Ornamental with graceful foliage, yellowish flowers in summer. Culture same as that of the acacias.

Leptospermum.

Leptospermum is from the Greek meaning slender seed. It belongs to the myrtle family, and is an Australian tree also. Dr. Franceschi reports that this tree stands drouth well in California. It will grow from cuttings. It is covered with a mass of white flowers. A tree which will stand much hard usage. Grows to 20 feet. Bailey says "it deserves greater popularity." This and probably the Pittosporums are the finest ornamentals yet introduced from Australia and are very hardy.

Myoporum.

A shrub growing ten feet high. The name comes from Greek words referring to the translucent resinous dots on the leaves. The different members of this family have been brought from Australia and New Zealand. It is recommended for near sea coast and will stand salty conditions. In Paris one gardener grows 30,000 of these plants every year, potting and selling when in flower. Flowers are snow white and borne in great profusion. Berries are also ornamental.

Callistemon, Bottle Brush.

The name of this evergreen shrub comes from kallos (beauty) and stemon (stamens). The stamens are mostly of a beautiful scarlet. Seedpods are regular and button-like, very close to the stem, and remain closed imprisoning seed until broken from the tree. Will also grow from ripened cuttings, and reaches a height of four to 20 feet.

* * *

The Arizona Agricultural Experiment Station recommends for that section the following alkali enduring shrubs:

Salt Bushes:

Lycium Gracilipes and L. Fremontii, squaw bushes. Fleshy-leaved plants, desirable as winter and spring ornamentals, being very conspicuous at these seasons by reason of their wealth of bright green leaves and many small bell-shaped flowers, which are soon followed with red berries. In the summer season these plants are entirely leafless, and need no attention as concerns watering or other care. Under native conditions the former species, in particular, inhabits rather alkaline areas, though it appears to grow as well with a little care in the ordinary mesa and valley soils.

Atriplex Lentiformis.

This is another of our native salt bushes which invariably frequents alkaline situations, likewise becomes attractive with cultivation. This plant has silvery-gray foliage throughout the year, the appearance of which is heightened in the fall with masses of golden-yellow and silvery-white flowers. It is a robust growing species, ordinarily attaining heights of twelve to fifteen feet, though it endures heavy annual cutting back.

Atriplex Numularia.

A round leaved salt bush, and is a native of Australia and similar to the above. It grows about six feet high and has an abundance of deep green, rather fleshy leaves, being more compact in habit of growth than the former species.

Tamarix.

The various species of tamarisks also flourish in soils more or less alkaline.

THE DAHLIA AND ITS CULTURE.

There are three methods of propagation of the dahlia—from seeds, from cuttings, from tubers started under glass, and by divisions of old clumps.

Seedling plants are unsatisfactory, as there is only a small proportion of good ones for the effort expended.

Green-grown plants give in most cases the best results for cut flowers in a number of ways.

My preference is for divisions of old tubers cut as small as possible, planted about May 15th. When about four inches high, top them. If they are in good, rich soil and conditions are very good, I would top these a second time as soon as they make growth enough to do so, and give good culture; but they should be planted deeply and, as they progress, should be cultivated so that the soil makes quite a ridge.

The culture should be with a view also of firming the soil as much as possible for the best results, as the radiation of moisture from loose soil is trying to dahlias striving for best results.

The whole idea in growing dahlias is to have them make a constant, rapid growth.

When green plants are wanted they should be started into growth at any time after Christmas, and cuttings taken as soon as large enough to do so. These should be potted up as soon as ready out of the sand beds into poor soil, as rich soil induces a soft growth. The poor soil makes a better plant and more vigorous, and less liable to damage while under glass.

We top them when planting about June 1st and give a second topping as soon as possible; thus the plants remain shorter, and the yield is greater. But in any event we allow but one stem to grow. The dahlia is a gross feeder and should have plenty of water.

If these plants are given the attention as above there is no reason why any one should not have an abundance of blooms.

The following are very good early, free-blooming sorts:

For show—A. D. Livonia, pink; Arabella, yellow, suffused rose at tips; White Swan, fine white; Hector, rich brick-red; Frank Smith, maroon, mottled white; Amos Perry, rich scarlet; Countess of Lonsdale, salmon-red; Floradora, rich maroon crimson; J. H. Jackson, very dark maroon; Standard-Bearer, fine red; Winsome, best white; William Castle, rich yellow.

For DecorationC. W. Burton, rich yellow; Black Beauty, maroon black; E. L. Bassett, rich purple; Jack Rose, rich "Jack Rose" red; Orange King, orange red; Sylvia, fine pink; Wm. Agnew, rich scarlet.—Farm World.

Shortage of water is compelling many alfalfa growers at Tipton, Tulare county, to install motors.

CITRUS CONVENTION WITH A MESSAGE, Cover.

LONGER LIFE THROUGH SEED AND BUD SELECTION, 267.

CITRUS.—Decadence of the Navel: 268, 269, 287.

DECIDUOUS FRUITS.—Apple Awards at Watsonville; Soil Convention; Pruning the Apricot: 270, 271.

LIVE STOCK AND DAIRY.—The Orphans; Large Black Hogs; Distemper in Horses: 272, 273.

ORNAMENTAL GARDEN.—Alkali Resistant Ornamentals; The Dahlia and Its Culture: 274, 275.

EDITORIAL.—Soil Convention; National Irrigation Congress; Robbing Peter to Pay Paul; Decadance of Citrus Trees, 276.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST. — Northern, Central, Southern, The Coast, 277.

PROFIT IN POULTRY YARD.—Indian Runner Ducks; Poultry Queries; English Red Caps; The Farmer's Fowl; Poultry Show Dates; Poultry at Orange Street Fair; The San Jose Show: 278, 279, 280.

GENERAL AGRICULTURE.—Concrete Fence Posts; Farm Names, 281.

QUERIES AND REPLIES.—Pruning Pepper Trees; Yellowing Leaves; Hard Soap; Sulphuring Grapes; Olive Varieties; Trees for Land Not Irrigated; Preparing Land for Potatoes; Peach Borer; Jelly From Tunas; Paraffining Orange Blossoms; Lotus; Budding Nursery Trees: 282, 283.

HOUSEHOLD.—The Sum of Living; The Rich Poor Horse; Benefits of Candy; Lying Hurts the Liar; To Clean Parasols: 284, 285.

PRODUCE MARKETS.—Los Angeles Market, San Francisco Market; Deciduous Market, Citrus Market: 286, 287.

Soil Convention.

The greatest problem confronting the soil tiller has to do with the physical and chemical condition of the soil. These questions are not simplified for the California tiller; in fact, it has been asserted that the question is more complicated here than in the East.

The University of California is conducting a series of experiments which it is hoped will lead to material results. It has now taken a different step, securing two of the greatest authorities on soils which this country has produced. These scientists are to come to California, make a critical examination of soil conditions, and later deliver a series of addresses on what they have found, and we doubt not will tell us what to do to better conditions. Dr. Cyril G. Hopkins, Professor of Agronomy in the University of Illinois, Chief in Agronomy and Chemistry, Vice-Director of the Illinois Agricultural Experiment Station and author of "Soil Fertility and Permanent Agriculture," is one of these. The other is Dr. F. H. King, formerly Professor of Agricultural Physics in the University of Wisconsin and author of "The Soil," one of the most quoted of books on soil fertility. Dr. King will lecture on soil chemistry, rational fertilization, plant foods and irrigation, soil water, soil physics, and tillage.

This course of lectures will be delivered in the Chamber of Commerce building, Los Angeles, October 3-7, a solid week of exceptional educational advantage to every soil tiller.

In addition, Prof. Norton of the Experiment Station at Riverside will give a description of his work at the Citrus Experiment Station, and Dr. Lipman will lecture on soil bacteriology.

Arrangements have been made with the railroads to give reduced rates.

Prof. J. H. Norton informs us of the schedule which will be followed by Drs. King and Hopkins on their arrival in California: Sept. 25, Limoneira Orchards, Santa Paula, Ventura county; Sept. 26, afternoon, looking about Riverside, with banquet at Glenwood in the evening; Sept. 27, detail investigations of Arlington Heights orchards at Riverside; Sept. 28, making the loop through San Bernardino, Redlands, Crafton, Mentone, and Patton, and back to Riverside at night; Sept. 29, Rialto, Etiwanda, Cucamonga, Ontario, staying over night at Pomona; Sept. 30, investigating foothill section between Pomona and Pasadena, spending the night at Pasadena; October 1, Fullerton, Anaheim, Orange, Santa Ana, and other Orange county points.

National Irrigation Congress.

Next Monday morning, September 26, the gavel will call to order what will probably be the most important session of the National Irrigation Congress at Pueblo, Colorado. This is the eighteenth meeting of the national organization, and already believers in national control of our great national resources are lining up to battle with another powerful class which believes in state control.

Amongst those who believe in national control are Gifford Pinchot and his large following. On the other side are those who believe that the state will advance more quickly if these lands are opened up to private interests. It is often claimed that with the latter class are lined up the larger interests, and that with the former lie the interests of the people.

The slogan of the Congress is, as it has been for years, "Save the forests; store the floods; reclaim the deserts; make homes on the land."

More than 300,000 families in the United States are today living in homes of their own on lands made productive through irrigation. The 13,000,00 acres under water are yielding up annually harvests valued at more than $250,000,000.

The 40,000,00 acres of irrigable land for which there is water available, will, when reclaimed, provide homes for 1,000,000 families or 5,000,000 men, women and children, and, together with the towns and cities developed in connection with their settlement, will support a population of 10,000,000 people.

Gifford Pinchot's address is on the topic, "The Actual Battle." This gives range for imagination as to his particular handling of it, but it is safe enough to predict it will be along the line of his well known belief in the reclamation service.

Robbing Peter to Pay Paul.

The Cultivator has it on what it considers reliable authority that the railroads interested in California citrus fruit shipments have given a tentative proposition to the growers that if it is insisted that they carry lemons at a rate of $1.00 per hundred instead of $1.15, it will be incumbent on them to make specific weights on all shipments to take the place of conventional or estimated weights, as has been the practice up to the present time. The force and significance of this move will best be appreciated when the several factors to the problem are carefully considered. For instance, to quote the case as it is presented by the railroads: "Ever since the first move on the part of the exchange the Santa Fe and the Southern Pacific have been keeping tab on the actual weight of oranges and lemons, and the statistics prepared show that the average weight for a period of time is 9 per cent greater than the basis on which the rate is now made, which is 72 pounds for oranges and 84 for lemons. Figure this out, and it will only be a matter of about $35 per car if the rate is figured at actual weight. Last year there were more than 40,000 cars of oranges and lemons shipped from the state. If the railroads put this actual weight into effect, it would cost the growers of California $1,400,000 per year, or four and a half times the amount they saved on the lemon rate. The railroad officials say they never would have started the actual weight proposition if the exchange had not been looking for trouble. They are simply waiting to see what the courts decide, but in the meantime they are getting ready for all kinds of things."

The Interstate Commerce Commission has given its decision that the $1.15 rate is excessive, evidently having failed to realize that the conventional or estimated rate per box was in favor of the growers. It is debatable whether this contingency can be overcome. Precedent and custom will hardly present a sufficient argument to sustaint a plea that it should be allowed to so remain, because its application would certainly effect rates on all similar freight shipments. The proposition is certainly fraught with serious economic considerations to the citrus industry in this state.

But the negative influences calculated to overcome the $1 rate do not end here. It is further claimed that the railroads will withdraw the privilege of diverting cars of fruit in transit from one town to another; such diversions will in future be charged in the freight bill. Why should an increase of 50 cents per hundred on the duty of lemons bring about so much trouble? And who will be the man to unravel the complications that seem to be piling up? Who and where is the fellow that weighed the boxes, and who preceded him in overweighing them? Had we better lighten up the packed box in the future?

Decadence of Citrus Trees.

Real estate men and those interested in boosting California, as practically all of us are, regret to hear expression of deterioration of any industry of our state, but as much as we may regret to admit an undesirable situation in our orange groves, plainly a condition exists which calls for earnest consideration. There were many in the convention recently held at Pomona who openly deplored the fact that decadence of orange trees had been brought to the attention of the outside world. Most of these were honest in the belief that the trees had not passed their profit bearing age, but, as was expressed by one speaker, the decadence was rather in the man than in the tree, shown in neglect to renew its profitableness. By resolutions passed, a similar feeling to this was shown to be the unanimous belief of those attending.

A consideration of this question will force upon orange growers the advisability of more conservative figures. Indeed, we believe this will be the part of wisdom for several reasons. As one speaker remarked, "Why doesn't the assessor visit my place when he figures high values upon orange land; my trees don't pay, and the assessment rate is altogether too high." Therefore, if it is a possibility that an orange grove ceases its profitable producing in a score of years, the profit and loss account must be charged with an amount sufficient to cover this deterioration. Again, when Congress has to deal with an increase or decrease in tariff, claims for great profits made in California will be used liberally to force a lower protective rate.

It goes without saying that California has thousands of acres yet undeveloped, and this development must come not only from our own efforts, but from inducing immigration of new blood and new capital. This the state needs and must have, but let us figure more intelligently than we have in the past, and induce people to come by telling them the truth as to what orange and lemon and other industries can do for them and have done for us.

The official call for the Dry Farming Congress to be held in Spokane, Washington, October 3-6, directs attention to an event which will mean much to farmers of semiarid America. The people of Spokane are putting forth every effort to make this a notable meeting, and the energy of that town will be remembered by those who attended the Irrigation Congress held there last year. In addition to the Congress will be held a Dry Farming Exposition in which there are expected to be 5000 entries.

The Fifth National Dairy Show will be held in the Chicago Coliseum, October 20th to 29th, 1910, instead of in Milwaukee, as previously announced.

Agricultural News Notes of the Pacific Coast

Northern California

Santa Rosa vineyardists are securing ten dollars a ton for wine grapes.

The Healdsburg Enterprise reports prunes as going up in price, the best figure realized was 5¼ cents or $140 per ton.

Central Creamery Company in Humboldt county is making plans for the erection of a dried milk plant to cost about $75,000.

An alfalfa meal mill is to be constructed at Biggs, Butte county. It will contract for alfalfa at seven dollrs per ton delivered at the mill, contracts to cover ten years.

The harvesting of peaches and pears throughout the Maywood Colony (Tehama county) district has just been completed and the crop has been a big one. Prunes and almonds are now being harvested.

The receipts of fruit money at the banks of Vacaville show that the net returns to the growers are over $70,000 more this than last year. In 1909 up to July 28, 551 cars of fruit had left Vacaville. This year on the same date 642 cars had left.

The uses of the great American business hen are certainly increasing. Bihn brothers, of Petaluma, recently gave 1000 head to a church fair in Santa Rosa, presumably to be given away to every handsome girl that will enter a kissing bee or a spelling match.

Mr. Walter Storey of Healdsburg is the owner of a pigeon farm with 2000 head. His market is San Francisco. Shipments are made twice or three times a week, and the birds bring from $3.50 to $4.50 a dozen, varying of course with conditions of the market.

In a comparative statement issued by the California Fruit Distributors published in The Reporter; it is announced that 8,151 cars of fruit have been shipped to the markets of the east from California this season as against 8,067 at corresponding date in 1909. The shipments consisted of cherries, apricots, peaches, plums, pears, grapes and apples.

Two of the prize taking carlot exhibits at the recent Sebastopol Gravenstein apple show were sold by the Earl Fruit Co. The car that was awarded the first prize brought $1,371 at auction in Chicago, which is a fraction over $2 per box for 664 boxes. The third prize car was sold in New York at auction for $2.30 per box. Both prizes were gross.

Manager J. P. Dargitz of the California Almond Growers' Exchange reports that the almond operators are trying to undo the work of that association. They bought Drake seedlings at 10 cents and paper shells at 11 cents, 12 cents and 13 cents, and then resold the Drakes at 11¼ cents, while the better varieties went for 13¾ cents, 11½ cents and 14¾ cents. The exchange has already sold 20 out of 100 carloads which it controlled this season. The crop this year in California aggregated about 200 carloads, and of this amount the trade has already taken up fifty cars.

The taking of the irrigation census in California and Nevada, in accordance with the general census law of 1909, began from state headquarters in Berkeley September 19 and will continue until its completion about March 1, 1911. The information irrigators are required by the census law to furnish is covered by ten different schedules, one each being provided for reclamation service projects, Carey Act projects, irrigation districts, co-operative or mutual enterprises, corporate enterprises, private or partnership ditches, private pumping plants, private reservoirs, private flowing wells, rice irrigation companies, and private plants irrigating rice.

Central California

San Joaquin Valley fig crop will be ten per cent of normal.

A farmer at Coalinga, Fresno county, has succeeded in growing cotton.

Work at the Spreckels Sugar Factory began on September 1st. The fields all promise an excellent crop.

The veterinarian of Tulare county reports small number of cases of hog cholera with the disease being brought under control.

Suit has been entered by an alfalfa grower at Hanford, Kings county for damages for the destruction of 110 acres of alfalfa by band of cattle.

A prominent dairyman in Modesto estimates that there are ten thousand cows being milked daily in Stanislaus county. He is also of opinion that there is room and need for ten thousand more.

The Standardization Association has had posted in the Lodi fruit sheds the following notice: "For the purpose of collecting the tax levied by the San Joaquin County Standardization Association, one-fourth cent per package will be charged on all grapes shipped from this shed."

The harvesting of the sunflower crop in south San Joaquin is going on. Hundreds of acres were planted to sunflowers this year, as the seeds bring a good price when sold to the oil manufacturers. A. G. Ballenger has fitted out a sunflower harvester with which he is now at work at Manteca.

At a recent session of the Tulare county broad of supervisors an appropriation of $6000 was set apart for the use of the forestry board in parking the Mooney Grove, now the property of the county. The money will be subject to the demands of the foresters appointed some time ago by the supervisors.

Kings county's raisin crop for 1910 is estimated at 10,000 tons, about 2000 tons more than produced last year. The grapes are now nearly all on the trays and ready for turning. Some early varieties have already been sun-cured and delivered to the packing-houses. The crop this year has been uniformly better and of a better average yield than last year.

The records of the secretary of the Modesto irrigation districts show that 28,196 acres are under irrigation in that section. It shows that the number of trees and vines has decreased this season, while alfalfa has shown an increase. It is stated that many of the growers, discouraged by low prices, have pulled up their grapevines and replaced them with alfalfa.

The proposed West Side Irrigation district of the San Joaquin embraces all the irrigable lands on the west side of the valley extending from Vernalis on the north to Whites Bridge on the south and according to the latest geographical survey embraces 2,001,300 acres of land situated within the following counties, to-wit: Merced county, 88,500 acres; Fresno county, 668,200 acres; Stanislaus county, 44,600 acres.

It seems reasonable to assume that cotton may be grown in some of our interior valleys outside of the Imperial section. Samples of cotton have been produced in Tulare county that certainly possess quality. A. Sustarich, one of the well known farmers of the Poplar section, has been conducting a few experiments in the culture of cotton and he is convinced that the Porterville region will produce as good cotton as any portion of the country. He raised only a few plants this year, but quite enough to show that the plants will grow there. Samples placed on exhibition at the Messenger office, which men, experienced in the cotton industry, have pronounced the equal of the best of the long stable grown in the south.

Southern California

The Fullerton chamber of commerce will take steps to interest ranchers in a project to build dykes to prevent the overflow of the Santa Ana river in that section.

One company has filed on 2000 inches of the Mojave river in San Bernardino county and will plan to irrigate a large tract of land.

W. B. Morgan, fish, fire and game warden of Los Angeles county, died on Friday afternoon last, at the home of his daughter, Mrs. Henry Baetz, 526 Sichel street, Los Angeles.

C. Paulsen Visel, has leased 2000 acres of fine grazing land in the San Jacinto mountains from the Southern Pacific Railroad and in a short time will stock it with a big herd of cattle.

Los Angeles' Board of Health is sending out a circular letter to growers and shippers, accompanied by a copy of the ordinance of this city, warning them to be careful and not ship wormy fruit to this market.

The largest producer of walnuts in this country is Orange county. The crop is now being harvested, and it is estimated that 7,000,000 pounds will be harvested from that county alone. This means returns of $800,000 to $900,000 at current prices.

A deal is on for the sale of the Gregory & Langford peach orchard of 418 acres, near Colton, together with the San Bernardino sewage contract by which irrigation is secured for the tract, to a syndicate of Los Angeles and Santa Monica parties.

The beet growers of Compton have incorporated under the name of Beet Growers Realty Company and bought ten acres on Temple street south of Main. This will be leased to the Government for a term of five years for the purpose of carrying on experimental plantings to sugar beets.

The July pool of the Tustin Lemon Association has been issued and pays to its growers from 1.47 to 4.39 cents a pound or an average of 3.84 cents on all grades. Seven cars have been shipped during the month of August all of which sold at good prices. Another sweat room has been added to the packing house.

Stockholders of the Glendora citrus fruit association recently held their annual meeting. The report of the secretary showed that 152,510 boxes of Washington Navel oranges, 41,032 boxes of Valencias and 7,796 boxes of miscellaneous oranges were marketed during the season. For this fruit the growers received $275,268.98. The average for navels was $1.28½ per box.

For several months many orange growers located witihn a mile or two of the Riverside and Colton cement plants, have complained that the dust from the large cement plant injured their oranges. Some weeks ago the growers near the Riverside plant also organized, with a view of taking some steps to overcome the nuisance. In view of the installation of a newly patented process for its control that will put the dust nuisance out of business altogether, it is claimed there will be no possible chance for future complaints.

The Riverside Press says that a number of young men was encounttered in the Cleveland forest reserve gathering pine cones for the government. No less than nine were employed, some making as high as $5 and $6 a day. The government pays 30 cents per sack for the cones. The cones must be cut from the limbs with a pair of clippers, just as an orange is picked. They are dropped to the ground, where they are sacked and checked up by the rangers. At the rangers' headquarters the cones are spread in the sun and air on canvas, the seeds popping out after a brief exposure. The seeds are then sacked and stored for future disposal.

The Coast

Rains did much damage to harvested grains of Nez Perce, Idaho, the first of the month.

One apple grower at North Yakima, Washington, has netted over $500 an acre from his winesaps.

A large prune grower at Salem, Oregon, is urging the doubling of the planting of prune orchards.

A station under direction of the forest service will be maintained on the Island of Mindanao, P. I.

Weiser, Idaho, is shipping both prunes and apples. Some days as high as seven cars of prunes are forwarded.

That the potato crop in Oregon will be short is said to be a certainty. The rain that has fallen came too late to do much good. Hot winds a short time ago did much damage.

The first actual movement of winter apples this season at Wenatchee, Washington, took place September 5 when a mixed carload of Winter Bananas, Grimes' Golden and King David left for the Chicago market.

Through Mr. H. P. Wood, secretary of the Hawaii Promotion Committee, at Honolulu, two introductions of seeds of rattan palm have been made from Java. It is reported that a large percentage of these have germinated and are doing well.

From the Bitter Root section in Montana ten cars have been shipped so far, and the work of packing and picking is now on in earnest. The apples shipped so far are: Wealthy, Alexander, Iowa Beauties, Dutchess, Yellow Transparent and Transcendent crabs.

The entire output of apples from the Hood River (Oregon) orchards has been bought by Steinhart & Kelly of New York. The crop this year will amount to 400 cars, or about 250,000 boxes, consisting of Spitzenbergs, Newtowns, Arkansas Blacks, Ortleys and Jonathans.

Umatilla county farmers have sold half of the wheat produced there this season, or 2,500,000 bushels. The market at the latest quotations seems to be on the down grade with 76 cents the mark for club. Fortunately the heaviest selling took place in the earlier part of the last 10 days and most of the growers secured 80 cents, not any selling below 75 cents.

Recently W. B. Cloyd placed on exhibition in the pagoda of the Yuma (Arizona) Commercial Club at the Southern Pacific depot a bunch of Peruvian alfalfa on which the seed has almost ripened. This was from the second crop raised on the same land this year. The first crop produced 600 pounds to the acre and much of it has been sold at fifteen cents per pound which means an income of ninety dollars per acre.

The twenty-fifth annual fruit show of the Oregon Horticultural Society will be held in Portland from November 30 to December 2 inclusive. The preliminary announcement gives the information that not only will apples and pears be entered in competition, but prizes are also offered for grapes, nuts, dried fruits, dried berries, dried vegetables. Fine lithographed diplomas will be given all prize winners. Printed prize ribbons to winners.

The horticultural staff of the Hawaiian Experiment Station has been augmented by the appointment of Mr. Valentine Holt, a part of whose time is being devoted to horticultural work. Mr. Holt has collected and prepared exhibits of a large number of fruits and other products shown at the Alaskan-Yukon-Pacific Exposition. He has begun work in the selecting and propagation of varieties of papayas with a view of systematic breeding.

Baby Chicks, Laying Hens, Pullets, Etc.

On hand every day of the year. Free 32-page catalog gives prices, descriptions, etc. We ship to every town in the West. Our prices are lower than any other dealer, as we buy more and sell on less margin of profit. We can fill orders for White and Brown Leghorn hens, 10 months old, Barred Rock, Rhode Island Red and Black Minorcas 10 months old. We have Black Minorca, Rhode Island Red and Buff Orpington pullets 2, 3 and sometimes older. Send today for catalog. State what yo' wish—kind, age and quality, and we can name the price.

We can fill orders for Reds and Barred Rock chicks ever' Tuesday at present.

Pioneer Hatchery Co., 112 E. 8th, Los Angeles

If you want your hens to lay more of those high-priced eggs, feed

West Coast Egg Food

Nothing better made for the purpose, and the price is now only $1.80 for 75-lb. sack, or $45.00 for a ton. If not sold by your dealer, sent to us. Or, if you are distant from Los Angeles, and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

West Coast Mill

Office and Salerooms, 115 Winston St.
Los Angeles, California

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

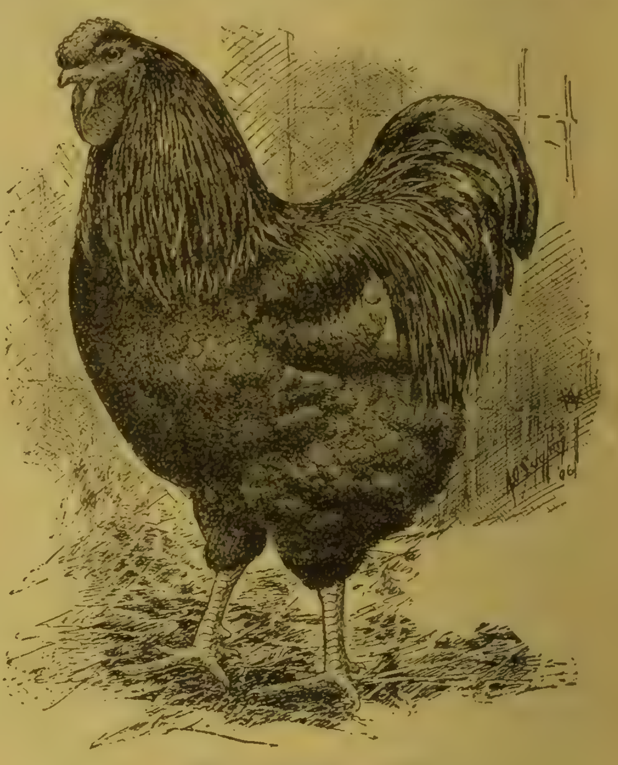
Profit in the Poultry Yard

THE INDIAN RUNNER DUCK.

ALMOST every one has raised a few chickens some time or other and knows something of the magnitude to which the industry has now grown, caused by its splendid inducements of recreation and pecuniary gains, but to date, duck culture is in its infancy and to those who now take advantage of the immense possibilities in its development, there is a snug fortune. Heretofore the industry has been hampered by the lack of a suitable duck—in combining both utility and fancy, but as the ideal has now been reached in the Indian Runner, it offers unheard of advantages and subsequent profits.

The Indian Runner Ducks originally came from the West Indies, where they had been bred for years as egg producers, making their first appearance in the United States some fifteen years ago. They derive their name from their native land and their very racy, upright carriage and activity.



Buff Wyandotte Cock.

In general they are admittedly the most beautiful in color markings and distinctive in type of any of the duck family.

In color they are fawn and white, being handsomely marked about the body and head. Bill is yellow splashed with green when young, and green with black bean when fully developed; shanks and toes a deep bright yellow. The body is long and narrow and carried very erect; neck long and thin with finely formed, long head.

In size they are not so large as some, the standard weight being 4½ pounds for the drake and 4 pounds for the duck, but they usually run over these weights. While lacking bulk as market ducks they excel in quality of meat, which is fine grained, juicy and especially well flavored. They grow rapidly and reach a marketable size of 3½ to 5 pounds in ten weeks.

The chief value of the Runners and the point which has made them the most talked of in duck history, is their great laying habits. It is from this fact they have been aptly termed "the Leghorns of the duck family." In England breeders claim individual records as high as 260 eggs per duck in a single season, but we consider this unusual and unsafe for calculations here. A pen of four ducks with good care often produce 1,000 eggs per year, and a flock of 100 will run from 175 to 200 eggs per duck in 12 months. They are very persistent layers, laying nearly every day after March, continuing through the summer, fall, winter and earl spring.

Contrary to the general idea of duck eggs, eggs from the Runners are of the very best quality and are superior to hen eggs for staple and fancy edible use. They are much larger than hen eggs, two of them being fully the equal of three of the hen's product, and are of such a mild, delicate flavor that a brisk demand has been created for them in the cities at an advance from 5 to 20 cents per dozen over hen's eggs.

As the Runners are related to the wild Mallard, they are very hardy, and being of such an active nature more can be yarded on the same ground than of other ducks, and if permitted free range will forage and gather the greater portion of their living.

They are not troubled with contagious diseases; are not infected with lice or other vermin; do not have scaly legs; are not subject to roup. They require no water except for drinking purposes and will thrive on any kind of land in any locality. A 24-inch fence will confine them and makes yarding a small cost. The fence can be portable by driving the stakes into the ground and gates are not needed as the attendant can step over the fence.

Yards 24 by 100 feet will accommodate a pen of 30 layers, thus minimizing space. The houses need not be costly or especially built for warmth, but should be dry. Eggs are usually fertile and can be hatched in incubators.

Ducks are profitable as layers for three years, and the drakes are fit to use as breeders for eight. They fatten readily and bring good prices. Their feathers are quite valuable and net a substantial revenue.

There is a steady demand for fancy show individuals, ranging in price from $5.00 to $25.00 each, and an overwhelming demand for eggs for hatching purposes, at attractive prices.

115 Winston St. - Los Angeles

The University Farm School began on Monday the fifth.

Taking everything in consideration, there is certainly no other duck that affords a greater profit for the time, experience and outlay of capital than the Indian Runner. And from their many advantageous points we predict for them a great future.

In conclusion, we wish to state that the possibilities of the Runners have been almost unlimited and as meritorious as they are, are going to be pushed to the front more and more. The better breeders have banded themselves together for concentrated effort by the organizing of a club, and through it we hope to have "more and better" Indian Runners.—American Poultry Advocate.

POULTRY QUERIES.

Inflammation of the Liver.

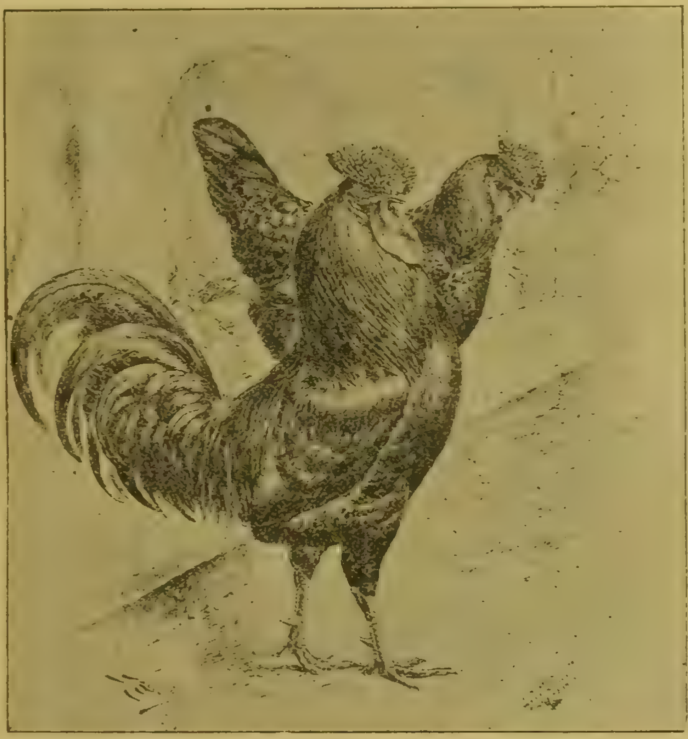
Some of my chickens have been having what appears to be indigestion. They become dumpish, usually refuse food, and the droppings are very soft, bright green or light yellow and odorless. One or two have had very light attacks, one had very high fever, one was crop bound with a very full crop and remained in that condition for about ten days in spite of treatment but after I had operated on it to remove contents of crop its recovery was rapid. My usual course of treatment with them is to give a dose of castor oil, isolate them from the rest of the flock and give them water containing one of the commercial disinfectants with chick feed and scalded sour milk when they begin to show hunger.—May B. Ames, Riverside.

You fail to mention the condition of comb in your birds; if dark purplish in color, general ruffled appearance of plumage, and brownish watery discharges, it indicates congestion of the liver. If the droppings turn yellow, inflammation of the liver has developed. Liver diseases are usually due to overfeeding. If the stage indicates congestion, use a good liver pill, and of course alter wrong conditions. If allowed to reach the stage of inflammation, treatment is invariably of no avail. As a general proposition, it is a good practice to always quarantine ailing birds from the healthy ones.

Enlarged Crop.

Can you give the cause and remedy for an enlarged crop? A seven months old turkey's crop is so large it strikes the knees; it seems to be filled with water, otherwise the bird is healthy and eats well.—M. M. Hix, Imperial.

Enlarged crop can be treated by cutting out a part of the skin and sewing up; usually a hazardous operation, and hence hardly worth the trouble. We suggest sending the bird to te block, then to the pot, and then to the family table, which is the usual ending of all good turkeys.



Pair English Red Cops.

Feed for Poultry.

Is barley and alfalfa meal a complete feed for laying hens, at least as much so as whole wheat? Do you know of a cheap hand mill for grinding alfalfa?—W. T. F., Orland.

Barley and alfalfa, according to analysis, will make almost a perfectly balanced ration, but we do not believe as good results will come from feeding such ration as a more varied one. The hens will have keener appetites and make better use of elements of food they relish. It goes without saying that a certain amount of change in stock feed is as desirable as with humans. A little wheat, a little corn and also a limited amount of meat would, we believe, more than pay for the additional cost. Dr. Twombly, at one time in charge of the poultry department of the Cultivator, maintained that barley was almost a completely balanced ration. As to a grinder we cannot give you information other than that the usual method where the commercially ground meal is not used, is to set the cutter so as to chop the hay in very short lengths. These clippings are then thoroughly moistened with hot water, covered and allowed to steam, when poultry takes to it almost as readily as to green cut alfalfa.

THE ENGLISH RED CAPS.

Sometime during the late eighties and the early nineties, there were a number of fanciers in and about Los Angeles that gave this breed some attentioin; of late years it has, however, apparently gone out of fashion. It belongs to the English class, and stands rather higher than any of its classmates, as a good egg-producer, records of 200 eggs per hen being not unusual. The most prominent feature of the variety is what gives it its name, the comb being bunchy and cap-shaped as shown in our illustration. The ground color of are striped with black; beak horn plumage is red. In cocks the hackles color; eye red; headgear red. Males weigh about seven pounds and females a pound lighter.

THE FARMERS' FOWL.

Of the American class the group of Wyandotte varieties has always been popular in California, with possibly the Whites slightly in the lead. This popularity is based quite as much on economic grounds as on grounds of beauty, as the bird possesses a symmetry and carriage peculiarly its own and of graceful curves. The young mature rapidly, and for this reason the Wyandotte has always possessed an attraction for broilers, fryers and roasters. The hens are good layers of fair sized eggs possessing a brown or tinted shell. They stand confinement well, and are considered among our best all-purpose breeds.

EGG MAKER

I Have Ten Hens and Get Ten Eggs Each Day

by feeding "Lee's Egg Maker." Without waiting another day, go out and count your hens—count them carefully. For a week keep an accurate daily record of the eggs you get. The guarantee below means *you*.

WE GUARANTEE

that no matter what you are feeding, and regardless of the number of eggs you are getting at the present time, if **Lee's Egg Maker is added** to the daily ration — make a portion of it — the increased egg yield resulting therefrom will more than pay the cost of the Egg Maker, cost of labor required, and **100 per cent profit** on said labor.

We don't care what your hens are doing *now*, we ask you to buy Lee's Egg Maker on our *guaranty* of an *increased* egg-production at a *reduced* feeding cost. Could we make you a better proposition?

The amount of good *digestible* protein is what counts for results in poultry feeding, and America's big feeders say Lee's Egg Maker contains more *digestible* protein than any other poultry food they can buy.

Lee's Egg Maker is almost entirely a meat food and with an actual tested protein feeding value in *excess* of *80* per cent, and you'll find in it the essentials entirely lacking in other prepared poultry food. The best feeding authorities in the country endorse it—and *use it*. *You* can't afford *not* to feed it, whether you have 10 hens or 1000, the proportionate profit would be the same.

Price: 2½ lb. pkg., 25 cts., 25 lb. pail, $2.00. Ask your dealer or send direct to us. We pay freight in 100 lb. lots.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

POULTRY AT THE ORANGE STREET FAIR.

New Orleans has her Mardi Gras, Los Angeles her Fiesta, and Orange has her street fair, which in some respects is more strikingly original, and certainly very unique. The dates are September 22, 23 and 24. Not the least of its attractions will be a fine showing of pure blooded fowl, for which there will be an entry fee of 25 cents per pair on fowls and chickens and 50 cents for pens consisting of male and four females, any age, of the same variety. Birds entered in pens may compete in pairs when properly leg-banded to designate exhibitor's choice. The awards will be $1.00 and ribbons on pairs of all leading varieties for first prize, and ribbons for second prize and to designate winners of specials. An entry of 10 cents will be charged on bantams and pigeons, and prizes of 25 cents on pairs with ribbons will are not awarded in classes or on specimens from failure to fill, the committee reserve the right to re-adjust same.

Something like 50 special premiums have been offered by the enterprising business men of Orange, in addition to which there are three silver cups and sweepstakes.

THE SAN JOSE SHOW.

Premium lists and entry blanks to the San Jose show coming off October 5-8, have been issued, and are now in the hands of breeders. This fixture promises to open the regular show campaign in good shape. Owing to the dates being before December 1st, when the weight clause goes into effect, the show will be judged by the comparison method, and by the rules of the American Poultry Association. Those who have in the past entered birds say that the San Jose is the one show that no exhibitor can afford to stay away from. No pains nor expense are being spared to make it better and more pleasing to every exhibitor. A first class superintendent, in W. E. Lewis, is assured to look out for the welfare of birds, and one of the best known and well-liked poultry judges, in Robert J. Venn, of Fresno, has been selected. The great Auditorium Rink, where the show will be held, is centrally located.

General Agriculture

CONCRETE FENCE POSTS.

CONCRETE—cement, sand, gravel, and water combined in proper proportions—has become one of the leading building materials of the day. It has shown its worth as a substitute for wood; houses built entirely of cement, the trimming and supports of wood being merely for decorative effect; it is used by the Government, by railroads, by farmers in hundreds of ways, either alone or reenforced; and has been found to produce even good fence posts. Its moderate cost, its durability, the ease with which it is handled, the wide distribution of the sand, gravel, and stone of which it is composed, commend it to the consideration of all builders.

As a material for fence posts concrete has been found to possess but few of the disadvantages of wood, to have practically all its advantages, and to be superior in some respects to timber. Of course, the first cost may be more or less than the best wooden posts, but that depends on local conditions—the timber supply, deposits of sand, gravel, and rock, the skill of the workman. If manufactured as usual and cured for three months concrete posts are as good as the best wooden posts. After three years wooden posts possess only one-third to one-half of their original strength, whereas concrete grows stronger with age and needs no repairs as neither weather nor fire injures it. Under ordinary circumstances concrete posts will last forever; and even if in the course of years a few should be broken by unusual strain, it is cheaper to replace them than to replace an entire fence of decayed posts with a material with the same lack of durability.

Concrete posts are attractive in appearance because of their uniform size and color, and can be made either square, triangular, or round, either straight or tapering towards the top. They can be purchased from dealers or made at home, and this latter plan together with suggestions as to the construction of the fence after the posts are made and cured is the theme of Farmers, Bulletin No. 403, recently issued by the U. S. Department of Agriculture. The author takes up in detail the selection of sand, gravel, crushed rock, and cement; the choice of molds—either steel or wooden, and if wooden, the proper way to make square or triangular molds. Reenforcement—the insertion of steel rods or wire in the molds when making the posts, is discussed as to the principle involved and the kinds of reenforcement best suited to certain needs. The work of mixing, molding, and curing is explained with minuteness, and the variety of styles which can be produced described. Under "fence building" is given instruction as to setting the posts, attaching the wire, stretching the fencing, and the use of line anchors. Patents have been issued on special types of reenforcement, and they can not be generally used without danger of infringing patent rights; but none of the simple forms described in the bulletin is patented or patentable, and they are just as good as the special forms advertised and recommended by the agents. No one need hesitate to use the simple form of construction recommended, for it has been in common use in all countries for a number of years, and all claims that the general use of reenforced concrete fence posts is controlled by patent rights are unjustified and untrue.

FARM NAMES,

Another name is added this week to the Cultivator's list. It is the name of a ranch at Covina some 20 miles east of Los Angeles. Information concerning this ranch is sent in by the owners on a beautiful bond embosed letterhead giving the name of the ranch and of its three owners and stating that the owners are citrus fruit growers.

Hespero Arboleda, Covina, Los Angeles county. Owners, M. E. Roush, treasurer, Wm. L. Steele, secretary, and J. H. Breckenridge, managing partner. Regarding the ranch and its arrangements Mr. Breckenridge writes:

"The above is the name chosen by us to designate a 51-acre ranch comprising sixteen acres Valencias, twelve acres navels, five acres lemons, fourteen acres walnuts, the remaining space being covered by a beautiful ornamental park. A pergola in natural wood with name in gilt and black letters suspended by chains marks the entrance to driveway which is studded with Robusta palms and ragged robbins. There is a 600,000 gallon reservoir and 600-foot well appurtenant to the ranch in addition to 100 shares of water stock.

Hespero, Venus as Evening Star; Arboleda, tree plantation or grove of trees. So you have the Star of the West Tree Plantation, or The Groves of the Western Star, or some other free rendering of the words to suit translators' fancy. We shall also use it as our firm name (Aparceria) meaning co-partnership. Mrs. Roush, Mr. Steele and myself constituting the firm. We have been subscribers to the Cultivator and readers for the past eight years and have adopted its "Ranch Name" suggestion as we have many other of its recommendations in ranching.

Although the question of road improvement is of direct interest to the residents of our towns and cities, it is, and must always be, one of prime importance to the farmers. By far the greater mileage of our roads is located in the farming districts, and the chief use of these roads is by the farmers in getting their products to market, and for social intercourse with their neighbors. In recent years the invention of the motor vehicle has served to bring about the general use of our highways by tourists travelling for pleasure, but although this use will doubtless be greatly increased in the future, the bulk of the travel on the country roads will continue to be that of the farm wagon or buggy—T. C. Laylin, Master Ohio State Grange.

Hon. W. A. Evans, Commissioner of Health of the City of Chicago, last week authorized the announcement that his department would offer every assistance possible in making the educational features of the National Dairy Show effective. The campaign made by this department for pure food products has aroused the people of Chicago and this announcement by Dr. Evans is very important,

So long as your knife is a
KEEN KUTTER

it is immaterial whether the handle is pearl, ivory, bone or wood—the blades possess that same distinctive *KEEN KUTTER QUALITY* which makes your knife a lifelong friend.

Keen Kutter Safety Razors give the true barber's stroke and are so scientifically adjusted that they *cannot* shave wrong. Whether used in right hand or left, they shave through light or heavy beard with the greatest ease and comfort.

PEERLESS IRON WORKS, 126 O Street Sacramento, Cal.

CAN YOU SAW AND HAMMER?

If you can, you can fit out your poultry house with 1910 conveniences. Other poultry keepers who work at their regular trade or business make hoppers, ordinary and trap nests, fireless brooders, fresh-air doors and windows, portable fences, and even fresh-air and portable houses, during their spare time, and you can do the same. Probably you have never been told how these conveniences can be built—everyone doesn't know these things—but you now have an opportunity to learn from the builders themselves.

Simple descriptions and 146 illustrations of everything the builders have found "just what the doctor ordered" are contained in a new book **Built and Used by Poultrymen.** This is the only book that tells you how to make these things just as though you were talking face to face with the builders themselves. Mr. Jensen tells you how he built two kinds of fireless brooders (one is shown above), and so on through the *fifteen chapters.* Read their titles and see the large number of subjects treated.

Modern Breeding Houses. Modern Colony Houses. Modern Brooder Houses. Houses for Indoor Brooders. Houses for Males and Small Pens. Adapting Barns for Poultry. Movable Fences and Fencing. Nests and Trap Nests. Brood Coops, Runs and Pens. Modern Fireless Brooders. Hot-Air Brooders. Shipping Day-Old Chicks and Eggs for Hatching. Food Hoppers and Fountains. Methods of Sprouting Oats. Other Useful Devices.

This valuable 100-page book, bound in a handsome colored cover and filled with helpful reading matter and 146 clear illustrations, will be mailed to you for **one-half** the publishers price, if you accept our **Special Offer.** Act promptly and profit by these new ideas.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pruning Pepper Trees.

I have a row of peppers planted along a roadway of my orange orchard which have made a phenomenal growth this year, being planted in April. They have some large branches which are too low, but which I have neglected prunning on account of it being such warm weather. I supposed these should be pruned in the late fall or early spring. But the branches are growing so tremendously, and desiring the trees to grow up as soon as possible on account of the shade, I would like to know if now would be a poor time to prune these trees, leaving just the middle limb and thereby throwing all the growth into this one limb, which will make the trunk of the tree.—Subscriber, Visalia.

We think you have made no mistake in allowing the trees to grow as they have. This first season's effort should be given to establishing a strong root system and trunk large enough to carry weight of top. If side branches are suppressed entirely this is impossible. If the growth is too rank in them, repress by clipping a few inches of the ends of the ends off, thus favoring more upward growth. Then, toward spring cut off clean at junction with trunk. This will give a stocky trunk which may not need staking.

Yellowing Leaves.

Leaves of young orange trees are spotted with yellow. Is this serious sign.—Subscriber, Visalia.

Doubtless chlorosis. It may be from poor physical condition of soil. Cultivate deeply. Break up any hardpan. See answer to similar queries in former Cultivator.

Hard Soap.

Take two quarts of cold soft water, add one can of good concentrated lye, and three tablespoons of pure borax. Stir well with a clean stick and let stand over night. When adding the lye, be careful not to get your face so near that you will inhale the fumes. Next morning warm five pints of grease, rendered and clean from any sediment; it should not be hot, but about milk-warm, simply melted. To this add the solution of lye, and stir until it "sets." I generally have it a little thicker than thick cream, but one must use one's own judgment at first. Pour into a shoe box and put to one side, watching to see that it does not yet too hard before marking it off in bars. This makes ten nice cakes of soap. In the light of the moon is the best time to make soap as it does not shrink away so much at that time.—Mrs. J. A. D., Highland.

Sulphuring Grapes.

I have a grape vine, which bloomed last spring showing very large, finely shaped bunches. Not a grape formed, both the bloom and stem of same, dried and dropped off. What was the matter?.—E. S.

It might be several different things, from this brief discription. I will venture to guess, knowing the region and season ,that it is mildew and if the vine had been carefully sulphured when it first started growth and again when it blossomed the fruit would have set all right. Be patient. Young vines are like other young things often a failure at first. Next season sulphur and see if the fruit does not set properly.—M. E. S.

Olive Varieties.

Will you give suggestions as to three or four of the leading varieties of olives? The Mission, Manzanillo, Obliza, and Ascolano are all favorably spoken of here. Mission are hard to secure this season, and the question with us is what to plant as substitutes. Also what distances for planting olive trees.—C. E. M., Lindsay.

The Mission olive is a little harder to start from cuttings and the nurserymen never have enough of them for their orders.

All four varieties are highly recommended for California planting. The Mission is the only one that has been well tried out as a producer. The Manzanillo has been tried for twenty or thirty years and until last season was satisfactory as a producer. Last season a small number of th ripe fruit showed rot at the pit. W do not know that this will occ again, but if it does come it w spoil the olive for a ripe pickle.

The Obliza is recommended h but has not been very extensi planted as yet. The Ascolano ha poor coloring that makes the fru undesirable for pickling either ripe or green.

The money in olives at present comes from the sale of the ripe pickles, the oil is practically only made to get back the money expended in the harvesting and growing.

Olive trees are usually planted twenty to twenty-five feet apart. At twenty years old the alternate diagonal rows are removed to give the trees more sun and light. We planted over forty feet apart and placed a peach tree between each one. Now the peach trees are about all gone and the olive trees are taking the room up pretty well.

The olive tree does best on heavy land and needs plenty of water, two summer irrigations, one as late as possible helps the fruit out finely as to the size of the berries.—M. E. S.

Trees for Land Not Irrigated.

What are some of the best quick growing shade or ornamental trees to plant between house and road where soil is good alluvial loam, but overful of river gravel, which dries out badly. Even weeds die in summer, but grape vines and alfalfa once established, hold on. Would any kind of hedge make good in these conditions?—B. S., San Luis Obispo.

On land which will grow alfalfa or grapes without irrigation almost any of the ornamental trees will do well. Of course it goes without saying that when the trees are young they should be given some water, with buckets or in some other way, to keep them alive until the roots reach the lower moist sub-soil. Almost any of the eucalypts and most of the acacias, as well as others, would be satisfactory if planted in this soil. Any deep rooting tree which would answer for a hedge would probably do well. We think the Monterey cypress would meet the conditions, as would also the California privet.

Preparing Land for Potatoes.

I have a piece of very sandy land which I wish to prepare for fall pota toes next season. What is best to plant to turn under this winter? Land is irrigated. Will oats, or vetch and oats or Canadian peas make good hay or cow pasture? When should they be sown? When should millet be sown for seed?—Subscriber, Hemet.

The best plant for winter growth for green manuring is the vetch, though the Canadian field pea crowds it closely. In this case where you have prepared the land we believe we would plant vetch, and if you desire a greater amount of humus it is possible the addition of a little rye would add to the quantity. We would plant the vetch just as soon as we could get the seed in the ground. Irrigate the land heavily so as to get an early start. Then if there is good fall growth we would plow under in February and plant cow peas for the summer growth. This, again, could be plowed under in June and put in condition for your fall potato crop. Millet should be planted for seed in California in April or May.

Peach Borer.

What shall I do with my young peach trees They seem to be worm eaten about the crown, in many cases so badly that the trees break off at the ground. Only nursery stock planted this spring is affected; seedlings are untouched.—Subscriber, Lakeside.

In this case the inquirer gives such meager details that it is impossible to give a very intelligent answer. "Worm eaten" may mean the work of cutworms, cutting young herbaceous growth until the tree topples over, or perhaps older wood is affected by flat-headed borers working in the heart wood. In the former case, poisoning with bran mash and arsenic is the method to be followed; in the latter probe with wire the wounds in the trees occupied by the borers. In either case the protection of the young trees with yucca tree protectors will be advisable.

Jelly from Tunas.

Mr. G. P. Rixford who is connected with the Bureau of Plant Industry writes us that if the inquirer who wishes to know how to make jelly from tunas will send 25 cents to the Superintendent of Documents, Government Printing Office, Washington, D. C., for Bulletin 113, Bureau of Plant Industry, he will receive a 23-page pamphlet, beautifully illustrated, entitled, "Tunas as Food for Man." This book tells how to make Miel de Tuna and other foods. The so-called jelly is more of a syrup.

Paraffining Orange Blossoms.

Is there a method of putting paraffine on lemon and orange blossoms to keep them indefinitely?—M. F., Pomona.

We cannot give the details of the process, but believe it is simply a dipping of the fresh blossoms in warm paraffine. Of course it must not be too hot or blossoms will be destroyed. Dip not only blossoms but stems and leaves. If any of our subscribers can give us more details of the process they will confer a favor by so doing.

Lotus.

What is the plant I send? It is growing wild over the hillsides and spreading rapidly.—E. F. P., Reedley.

Its botanical name is Lotus Americanus, and it is found plentifully over the hills in the interior. It seems to revel in drouth and heat. There is little prospect of its ever becoming a pest. It is an excellent green manure plant, but we think of little value as a forage plant.

Budding Nursery Trees.

My sour orange nursery trees are from one-fourth inch in size down. Are they big enough to bud this fall? —E. F. P., Reedley.

The larger trees certainly will answer for budding this fall. The budding of the smaller ones will be determined by your experience as you work.

BUSINESS EDUCATION A NECESSITY

The writer recently visited the Isaacs-Woodbury Business College, located on the fifth floor of the Hamburger building, Los Angeles, and was much impressed with the magnitude of the school quarters and equipments, and especially with the character of the training given young people. This is strictly a business school—a miniature business world in fact. The instruction and training are along two main lines—one along the broad, general commercial line embracing the subjects of bookkeeping, banking, corporations, office practice, arithmetic, penmanship, commercial law, business English, spelling, business ethics, etc. This prepares the student for general office work, or for conducting business intelligently either for himself or for others. The other course of training is that which qualifies the student for office work along the line of shorthand and typewriting. It was learned through President Edward King Isaacs that there is constant demand for well-qualified stenographers and general office help, and that the school is unable to fill more than about one-half of the calls made upon it for its graduates.

The great business world is the best field for successful endeavor, and the Isaacs-Woodbury Business College—now in its 27th year, having kept pace with the growth of the city—offers unequaled advantages to ambitious young people desiring to be successful and to make the most of themselves.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

MISCELLANEOUS.

Learn Wireless and R. R. Telegraphy! Shortage of fully 10,000 operators on account of 8-hour law and extensive "wireless" developments. We operate under direct supervision of Telegraph Officials and positively place all students, when qualified. Write for catalogue. Nat'l Telegraph Inst., Cincinnati, Philadelphia, Memphis, Davenport, Ia., Columbia, S. C., Portland, Ore.

For Sale or Exchange—A No. 1 Twenty Century Carbide Gas Plant, 35 burners strong; with two-burner hot plate. Some globes and burners. Cost $100.00, in perfect order. $50.00 cash or would exchange for Bartlett & Kiefer pears and cherries, if No. 1 stock. Address H. L. Bauer & Sons, 737 Spring St., Los Angeles, Cal.

For Sale—Registered Holstein Bulls; 1 to 2 years old. Some sired by Prince Juliana, brother of former world's record heifer, Juliana De Kol. Dam and granddam, A. R. O. cows. Three record-breakers in some of their pedigrees. M. E. Sherman, Minnewawa Vineyard, Fresno, Calif.

For Sale—Cement pipe tools. Complete set of 8-inch cement pipe tools, including 300 rings. Good condition. 2 jackets, one core, hopper, reamer, tamps, scoop. Rings alone worth price. $75.00 cash, F. O. B. Covina. Ben F. Thorpe, Covina, California.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines and farm machinery that will do the same work as new at half price. Domestic and irrigating windmills and tanks; 4-H. P., 6-H. P. Fairbanks, 9-H. P. Moore, 10-H. P. Lambert, 20-H. P. Fairbanks; like new; 25-H. P. engine and mining hoist; 2-H. P. steam boiler and engine; complete wood sawing outfit, mounted on iron trucks with 9-H. P. engine, complete for $225. Light express wagons, surrey $35, baler, header, gang, disc, road, riding, and walking plows; cultivator, feed rack, wagon tank, fruit crusher, bone grinder, pipe, Fresno and Slip scrapers. Most anything a rancher wants second-hand Demmitt Co., upstairs, 120 N. Main St., Los Angeles, Cal.

For Sale—Gasoline Engines of all sizes, new Alamos, none better on the market. We also have a good stock of second-hand engines taken in exchange, and we guarantee these like new and still save you money. An investigation will pay and convince you. Bailie & Brandt Co., 943-945 N. Main St., Los Angeles.

For Sale—11 H. P. distillate engine just secured. Perfect in every particular. Can make attractive price if purchased at once. Machinery Exchange, Main and Bruno Sts., Los Angeles.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

FARM LANDS FOR SALE.

For Sale—Los Angeles' new water supply from the Owens River Valley opens up the most fertile land in all Southern California. This land is wonderful in its productiveness beyond belief. Potatoes that run as high as 500 bushels to the acre with an average of 330. Alfalfa 3 tons to the cutting. Timothy with 12-inch heads. Corn 70 bushels to the acre. Famous for onions and hogs. The world's prize at Portland Exposition for honey. The finest apples grown on the Pacific Coast, Spitzenburgs and Wine Saps being the favorite varieties. No better poultry country in California. No other land in California to compare with it. Foothill land with gentle slope, giving perfect drainage. One of the most complete gravity concrete water systems in the State now being installed by men whose irrigating systems in the orange belt of Southern California stand as models for modern orchard irrigating. Water from the hundreds of lakes in the high Sierras. An inexhaustible and assured supply. The Southern Pacific's new main line to the East, now nearing completion, places this valley in close touch with all markets. The choicest apple land will be subdivided into tens, twenties and forties. The elevation is 4000 feet. Typical California summers with no excessive heat and cool and restful nights. Mild winters with thermometer at 10 degrees above being the coldest. Practically no rain, about four or five inches during the entire year. Three hundred days of sunshine. Absolutely no fog. The finest scenery in America. The high Sierras at your very door. Trout streams within walking distance. You can leave the Valley in the morning, go to the summit of the Sierras, 11,000 feet elevation, pass a dozen beautiful mountain lakes and return to your home the same evening. Special inducements to early settlers. This land is not for speculators, but for real serious farmers who know the value of good land, water and climatic conditions when they see them. Will send kodak pictures and full descriptive matter upon application. JAMES R. H. WAGNER and H. S. COOK, Room 13, 329 South Hill St., Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

Fresno County—For sale, 320 acres; 160 alfalfa, 160 Muscat vines; fenced, cross-fenced, 1000 tons of alfalfa this year, 60 tons raisins, abundance cheap water, fine buildings, implements, 8-ton wagon scale; show profit 20 per cent, can make 30 per cent. Can subdivide. E. E. Bush, 805 Union Trust Bldg., Los Angeles.

For Sale—15-acre vegetable and fruit ranch in the famous Arroyo Grande Valley; 8-room house, barn, etc. Plenty of water. Good nearby markets in oil field. Price $8500, $3500 cash, balance 2 years, 8 per cent. R. M. Plympton, owner, Arroyo Grande, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

2285 Acres Choice, Deep, Sandy Loam—Ideal for subdivision or eucalyptus growing. Can be cultivated any day in the year. Southern Pacific Railroad runs through the ranch. Also close to deep water for shipping. Free from wind and frost. Now all planted to grain. Price $100,000.00 for limited time. Geo. W. Sill & Co., Watsonville, Cal.

For Sale Cheap—$300 buys a 160-acre relinquishment claim, fine rich level land, plenty of water at 150 feet. Close to a fine market. This is the best bargain you ever heard of. No exchanges. Wm. T. Mantz, Pattiway, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—A 14-acre farm, good for alfalfa, orchards, or small fruit. Good market, 2½ miles from town, ½ mile from school. Frame house and barn. Price $2250. Robert Werner, Loma Linda, Cal.

Fruits, Flowers, Sunshine, Progress—All these invite investigating beautiful Hemet Valley, Southern California. Booklet free. William Kingham, Hemet, Riverside County, Cal.

For Sale—El Cajon Grant Land. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. Hawley, 1548 D St., San Diego, Cal.

For Sale—160 acres in Antelope Valley. Good land and plenty water. Price $17.50 per acre. 160 acre relinquishment for $3.00 per acre; good land. Wm. Ohlson, 305 Mason Bldg., Los Angeles, Cal. Phone Broadway 1842.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

For Sale or Exchange—Walnut ranch, 17.72 acres, good crop. Free water. Near El Monte. W. G. Eisenmayer, Box 213, Los Angeles.

Sacrifice Sale—$2,000. My ten-acre dairy and chicken ranch with all improvements. Under irrigation. D. Clayton, Colusa, Cal.

For $1,900, Five Acres—Three, deciduous orchard; two, alfalfa. Full water right. F. Neal, Hemet, Cal.

DAIRY SUPPLIES.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans. Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey 108 E. 8th St., Los Angeles, Cal.

POULTRY.

White Orpingtons—Cook strain. We offer for sale a limited number of trios and pens of utility and exhibition stock at bargain prices for the winter season. Our breeding pens are imported direct from Wm. Cook & Sons, Scotch Plains, N. J., and are sons and daughters of first and second prize winners, Madison Square Garden. Messrs. Cook & Sons say of them: "They are all from some of the finest birds in this country." Book orders now for next season's hatching. Eggs $5.00 per 15. $25.00 per 100. Day-old chicks 50c each. October delivery. Rancho La Sonata, Box 143, Chula Vista, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

For Sale—Eggs for hatching, Black Minorcas, Barred Plymouth Rocks, and Rhode Island Reds, $1.00 per 15, $5.00 per 100; chicks, 12½c each. Also pullets and cockerels. L. W. Neilsen, R. R. 2, Box A 1, Petaluma, Cal.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers
Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME.
A few cockerels for sale. C. C. Bonnell, State Vice-President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

For Sale—One hundred 4 months old, one hundred 5 months, one hundred 6 months old White Leghorn pullets, Watson strain. Healthy and clean. W. J. Webb, Santa Maria, Cal.

Lodi Hatchery—Just hatched, chicks from healthy, heavy laying stock. Booking orders for later delivery. T. C. Hawley, 504 E. Elm St., Lodi, Cal.

Single Comb Brown Leghorn Eggs—$5.00 per hundred, $1.50 single setting. Mrs. E. Foran, Box 445, Visalia, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

THE SUM OF LIVING.

If you have a friend worth loving,
  Love him. Yes, and let him know
That you love, ere life's evening
  Tinge his brow with sunset glow.
Why should good words ne'er be said
Of a friend—till he is dead?

If you hear a song that thrills you
  Sung by any child of song,
Praise it. Do not let the singer
  Wait deserved praises long.
Why should one who thrills your heart
Lack the joy you may impart?

If you hear a prayer that moves you
  By its humble, pleading tone,
Join it. Do not let the seeker
  Bow before his God alone.
Why should not your brother share
The strength of "two or three" in prayer?

If you see the hot tears falling
  From a brother's weeping eyes,
Share them; and by kindly sharing
  Own your kinship with the skies.
Why should anyone be glad
When a brother's heart is sad?

If a silvery laugh goes rippling
  Through the sunshine on his face,
Share it. 'Tis the wise man's saying—
  For both grief and joy a place.
There's health and goodness in the mirth
In which an honest laugh has birth.

If your work is made more easy
  By a friendly, helping hand,
Say so. Speak out brave and truly,
  Ere the darkness veil the land.
Should a brother workman dear
Falter for a word of cheer?

Scatter thus your seeds of kindness,
  All enriching as you go—
Leave them. Trust the Harvest Giver,
  He will make each seed to grow.
So, until its happy end,
Your life shall never lack a friend.
—Boston Transcript.

THE RICH POOR HORSE AND THE POOR RICH HORSE.

THE poor rich horse, driven by a tall coachman with high hat and white gloves, looked very gay as he pranced up to the door of an elegant establishment on the avenue. The breast of the noble creature was covered with foam, and he held his head very high. His mouth was stretched wide open, and he tossed his head up and down and back and forth, and pawed the air with his fore-feet. So high were his eyes—almost looking toward the sky—that he scarcely seemed able to see a fat old dray-horse that stood near, regarding him with a sort of sleepy wonder, and considering him as belonging to another "set" than his, entirely. The old horse did not suppose it would do any good to pass the time of day with his neighbor, as the rich horse undoubtedly regarded himself as far too grand to communicate with such a humble personage, so he changed the bit around in his mouth, and was just about to drop into a gentle doze when a sound of distress from the rich horse caused his plain neighbor to open his eyes wide and to regard the former with considerable curiosity, which at length expressed itself in this wise: "You look very gay, neighbor; are you not comfortable with your fine silver-plated harness and shiny trappings?"

"I can hear you, though I can scarcely see you," answered the poor rich horse, "for my harness, although undoubtedly very handsome, is a perfect torture to me. You can see for yourself how my head is tied up by a new-fangled contrivance they call an over-check. My eyes are almost blinded by the glare of the sun, and my neck aches, and my head throbs, and I am really quite miserable."

"I don't know much about check-reins," bluntly said the rich poor horse, "and I have never hauled fine ladies around in their carriages. I supposed, by the way I have seen them petting you with their soft white hands, that they wouldn't want you to be dressed up so you would be uncomfortable or suffer by it."

"O, they don't think," sighed the poor rich horse, "they doubtless suppose I have a very fine time with nothing to do but draw this pretty doll's wagon. If I could only have my choice I would change places with you. I would rather haul a dirt wagon without any check-rein on than to be dressed up in this fine style and suffer as I do."

"You'd find the dirt-wagon pretty heavy hauling," replied the rich poor horse.

"But I'd have my neck free, and be allowed to exert my full strength doing it," retorted the poor rich horse with some spirit, and as he gave an extra strain at his check-rein, the rich poor horse noticed the blood was starting from the corners of his mouth. "Is it the check-rein that makes your mouth bleed?" asked the rich poor horse.

"Oh yes! I'm getting quite used to that. Very often my mouth is so sore I can scarcely eat, and then they think I'm ill, and a surgeon with a great long name—v-e-r-y-t-y-r-a-n-n-y I believe they called him—comes in with a black bottle, and ties up my head, and pours some dreadful medicine down my throat, and whips me when I kick at him."

The rich poor horse now opened his eyes wide and surveyed his companion under the light of some new idea.

"O, well, you don't have much hard work to do," said the rich poor horse, "you ought to appreciate that and make the best of your condition."

"I'll change places with you at any time," replied the poor rich horse. "My load becomes heavier than yours commonly is, because I am so tied back and curbed and reined, that half my strength is spent trying to relieve my aching muscles and neck. When I don't have to wear the over-check, then they put on the bearing (check-rein) rein, which is no better. And then when we fashionable horses grow old, and lose our style and spirit, we are sold to somebody who forgets we are not used to labor which develops the muscles, and we are whipped when we can't pull heavy loads, and have to endure exposure and all sorts of other hardships when the least prepared for them."

"Poor rich horse," said the compassionate attache of the dray, "I think I will try and be content with my lot after this."

Just then the drayman came around with some nubbins of corn. The gay coachman mounted his box and with a crack of his whip sent the poor rich horse flying down the street. The rich poor horse rubbed his nose on his master's shoulder and told him what he had heard about poor rich horses, and the two jogged off together the best friends in the world.—Pleadings of Mercy.

BENEFITS OF CANDY.

Give children plenty of pure sugar, taffy and butterscotch and they'll have little need of cod-liver oil. Sugar is, after meat, bread and butter, easily our next most important and necessary food. You can put the matter to a test very easily. Just leave off the pie, pudding or other desserts at your lunch or mid-day dinner. You'll be astonished to find how quickly you'll feel "empty" again, and how "unfinished" the meal will seem. You can't get any working man to accept a dinner pail without pie in it. And he's absolutely right.

The only thing that can take the place of sugar here is beer or wine. It is a significant fact that the free-lunch counters run in connection with bars furnish every imaginable thing except sweets. Even the restaurants and lunch grills attached to saloons or bars often refuse to serve desserts of any sort. They know their business! The more sugar and sweets a man takes at a meal, the less alcohol he wants. Conversely, nearly every drinking man will tell you that he has lost his taste for sweets. The more candy a nation consumes, the less alcohol.

The United States government buys pure candy by the ton and ships it to the Philippines to be sold at cost to the soldiers in the canteens. All men crave it in the tropics, and the more they get of it, the less "vino" and whisky they want.

In fine, the prejudice against sugar is born of puritanism and stinginess, equal parts. Whatever children cry for must be bad for them, according to the pure doctrine of original sin; besides, it costs money. I know families in the rural districts yet where the head of the family groans over every dollar's worth of sugar that comes into the house as a sinful and "unwholesome" luxury.—Dr. Hutchinson in Woman's Home Companion.

HOMELESS CHILDREN

Want fathers and mothers. Cultivator readers have taken hundreds of them, and they tell us of mutual happiness and satisfaction.

No home is complete without a child in the house.

Favorable arrangement can be made.

LYING HURTS THE LIAR.

"All boys," an old philosopher says, "are born liars."

Perhaps it is because lying is the diplomatic refuge for helpessness. The instant we learn to know punishment, desire to escape it becomes a prime instinct.

Morality, like knowledge, is not hereditary, but attained. The child must learn that lying is a sin and a self-injury, just as it must learn by being burnt to avoid the fire.

Until this lesson is learned, the child, youth, man will continue to lie. Many never learn it. Perhaps none ever learn it very thoroughly.

Lying comes not of aggressive shrewdness, but of cowardice and a shallow cunning that is often treacherous and tricks the lie into transparency.

But it is not the danger of being found out by others that is most to be dreaded; far more dreadful is it that the liar must know himself to be a liar.

His self-respect suffers; the leaven in him loses strength and leaves him dead dough.

The cunning that leads to lying is a rot that must permeate the whole character and make a man ever uncertain of himself.

It distorts his perspective, obscures his vision, and warps his comprehension.

Nothing else so shakes the confidence of one's friends as known lying does; nothing so shatters one's own self-confidence as does lying, whether known to others or not.

The tangled web makes it all the harder for the liar to succeed in even an honest undertaking. His lies are a ball-and-chain upon his foot. He flounders along, most of his energies being required to overcome the impediment, while the truthful man easily outstrips him.—Memphis "News Scimitar."

A HERO.

Tommy's mother had made him a present of a toy shovel and sent him out in the sand lot to play with his baby brother. "Take care of baby now, Tommy, and don't let anything hurt him," was mamma's parting injunction. Presently screams of anguish from baby sent the distracted parent flying to the sand lot. "For goodness' sake, Tommy, what has happened to the baby?" said she, trying to soothe the wailing infant.

"There was a naughty fly biting him on top of his head, and I killed it with the shovel," was the proud reply.—Lippincott's.

TO CLEAN PARASOLS.

Do not remove the cover from the frame to launder your parasol. Instead, open it out and wash the covering thoroughly, using brush, cool water and some good white soap. After rinsing, set it in the sun to dry, if the material is white; in the shade, if the material will fade. The wire frame will not rust, and your parasol will be found beautifully clean and dainty. It is well to wash it again in this manner in the fall, and not put it away in a soiled condition. Wrap in tissue paper, then in newspaper.—From Woman's Home Companion for August.

TO REMOVE COFFEE-STAINS.

"Coffee-stains, even when cream has been put in the coffee," says Woman's Home Companion for August, "may be removed from table-linen by rubbing the spots with pure glycerin. Rinse afterward in lukewarm water."

The right protection

You ought to have roofs made of the real, natural waterproofer—Trinidad Lake asphalt—for every building on your farm.

Genasco Ready Roofing

is made of Trinidad Lake asphalt. It doesn't crack, rot, rust, or blow off; and it lasts longer than any other roofing.

The Kant-leak Kleet insures against leaky seams. Does away with cement. Supplied with Genasco when specified.

Write for samples and the Good Roof Guide Book. Ask your dealer for Genasco, and look for the hemisphere trade-mark. Mineral or smooth surface. A written guarantee—if you think it necessary.

Honey.

W. W. Comb '10	.15
Dark Comb	.12½
Extracted W. W.	.8
Extracted, dark	.6½
Beeswax, per lb	.24@30

Hay.

Scott, Magner & Miller report:

Arrivals of hay during the week have been 6500 tons, or an average of over 1000 tons per day. This amount has been considerably more than enough to supply the demand, and the market has continued along in about the same overstocked condition that we have seen it in for the last three weeks.

In some sections the hay fields are becoming rapidly cleared, and it is expected that within a few weeks all of those who have hay in the fields will have been taken care of. The little rain that we have just had will tend toward this end, for the reason that those who have hay in the efilds will endeavor to market same as quickly as possible from now on.

Some round lots in the fields have been sold during the last week for immediate shipment. This has been about the only class of purchasing that has been done of late. Hay that is in store has attracted very little attention from the buyers as yet, and until the fields are cleared up, it is not thought that the stored hay will change hands to any extent at all.

Shipping demand has been fairly active of late, and quite a little hay has been moved from this market on coastwise or export account, and this outlet recently has been a great relief to the situation here.

Alfalfa hay continues to arrive in quantities, and is being taken care of steadily at current quotations. The feeling on alfalfa is decidedly firm.

We quote the wholesale prices in round lots, on today's market as follows:

Fancy wheat	.12.00@12.50
No. 1 wheat or wh and o	.9.50@10..50
No. 2 wheat or wh and o	.$8.50@9.00
Choice tame oat	.10.50@11.50
Other tame oat	.8.00@9.50
Wild oat	.7.00@9.00
Stock hay	.5.00@6.00
Alfalfa	.9.00@12.00
Straw	.40@50

Grain.

Wheat No. 1	.1.55@1.62½
Barley, good to choice	.$1.00@1.02½
Barley, poor to fair	.95@97½
Oats, white	.1.57½@1.62½
Rye, new crop	.1.65@1.70
Corn, large yellow	.1.55@1.60
Alfalfa seed	.14@15
Mustard brown	.4½
Millet	.2¾
Flaxseed	.5@5½
Broom corn seed, per ton	.23.50

Feed Stuff.

Bran, per ton	.25.00@26.00
Feed cornmeal, per ton	.36.00@37.00
Cracked corn	.36.00@37.00
Ground barley, per ton	.22.00@23.
Rolled oats, per ton	.30.00@32.
Middlings	.34.00@35.0
Oil cake, per ton	.40.00@41.5
Cocoanut cake per ton	.26.0
Mixed feed, per ton	.24.00@27.0
Shorts	.27.00@28.0

Deciduous Market

Sacramento, Sept. 17, 1910.

The following circular of the Cal fornia Fruit Distributors gives numbe of cars of deciduous fruit shipped fror all points in California for the weel (7 days) ending Friday morning, Sep tember 16th, 1910:

Peaches.

Ninety-nine and one-half ears. few Salways are still going forwar but the bulk of the movement has bee of Clings. There are very few mor of either variety available and thi coming week will probably mark th close of the season.

Pears.

Twenty-four and one-half cars. Shi ment of this variety has now reache very small proportions and there a very few left in the state.

Grapes.

Four hundred and ninety-six ar one-half cars. The grape movemei shows an increase of nearly 200 ca over last week. This consists almo entirely of Tokays, as the Malaga shi ments continue very small and wi continue to be of small volume durin the remainder of the season. Toka are showing fine size and color a are giving splendid satisfaction in markets. Movement during the comin week can be expected to be maintain at about the same volume as during t past seven days. Emperor and Co nichon grapes are showing up in goo shape and will be ready to go forwa in straight cars in about two weeks.

Weather Conditions.

Last Wednesday night and Thursd light showers of rain fell in this se tion of California. The storm was fo lowed by clearing and very favorab weather and it is not anticipated th the Tokay crop has been injured the least. The effect of the storm expected to prove beneficial rather th otherwise. Picking now going on all sections.

THE ALMOND SITUATION.

Manager Dargitz, of the Califor Almond Growers' Exchange, reports u der date of September 13 in Bulle No. 14:

It took time and attention to tablish our Inspection Bureau and st the shipping and arrange finances; this is all working nicely now. are now shipping, having shipped six cars last week and two more ready to go in a day or two. The new bleaching plants at Antelope and Fair Oaks are working nicely and those at Live Oak and at Oakley are starting. Yuba City will start up in a day or two.

Telegraphic and telephonic inquiries are very brisk in the past two or three days and we look for very encouraging business now in two or three weeks, possibly sooner, very soon after the walnut growers set their prices. In the meantime supplies are being reduced, getting into fewer hands, which always means better markets. Those who have been edging up under our umbrella are now about cleaned up and out of the way.

Citrus Market

LOS ANGELES, Sept. 21, 1910.

The orange market still promises good returns for the small amount of first-class fruit yet to go. Unfortunately many small sizes and other low grade fruit are in a less satisfactory condition. There are not more than 300 or 400 more cars to clean up before November 1 ,when new Navels are supposed to begin the new year's shipments.

Lemons are in keen demand with most satisfactory prices, but with only a few lemons to take advantage of the situation.

Shipments.

The total shipments for the season beginning November 1, 1909, aggregate 29,276 cars, of which 24,738 were oranges and 4538 were lemons. To same date last year 36,839 cars, of which 30,872 were oranges and 5967 lemons.

NEW YORK, Monday, Sept. 19.—Eleven cars sold. Market very steady on good fruit. Cloudy and cool.

DECADENCE OF THE NAVEL.

Continued from Page 269.

mobiles were pressed into service and the guests were shown all parts of the valley. Perhaps some of the orchards passed had trees that showed deterioration, but their well kept appearance would not indicate it to the passerby.

All those in charge of local arrangements did excellent work; trains were met and badges supplied to every attendant. Mr. P. J. Dreher, who acted as chairman of the local committee, was assisted by such workers as F. J. Smith, Hervey J. Nichols, Walter A. Lewis, V. V. Le Roy, E. C. Robinson, and A. A. Tait, and every other Pomona resident joined in making the visitors welcome.

Col. Firey, Mayor of the city, turned the joke on Commissioner Jeffrey neatly. A delay in the proceedings was made necessary because of the non-arrival of the stenographer from Sacramento. Wishing to crowd the full program as fast as possible, Mr. Jeffrey remarked, "Our opening proceedings will probably have little of interest, so we may proceed with them while waiting for the stenographer." Immediately he called upon Col. Firey for his address of welcome. Col. Firey responded that it lessened his embarrassment somewhat to know that special importance was not attached to his address, but nevertheless he had a most hearty welcome for everyone within the gates of Pomona.

A little amusement was created near the close of the last session because of the delay of the Los Angeles County Horticultural Commission. At the opening session reports were asked from the various county commissions. All the others responded but Los Angeles county was not prepared. All contended that there was no decadence in their counties. This was considered by the convention the natural backwardness of Californians to admit any weak point in their particular sections, and later resolutions were passed endorsing the calling of the meeting, and stating that there was abundant cause for immediate and emphatic action. After this resolution was passed, the Los Angeles Commission came in stating even more emphatically than the other commissions that their county was exempt.

Frederick Maskew, Assistant Superintendent of the Insectary at Sacramento, made an efficient secretary. In his hands will be placed the papers read and the shorthand reports of addresses and proceedings. These will be edited and later issued in book form by the state commission.

Expressions of appreciation were freely made of the work of the Whittier Pathological Station, and also of its branch, the Citrus Experiment Station at Riverside, as well as of the work done by Pomona College.

A. F. Call's extempore talk on gum disease was listened to intently. He gave many valuable points. He has proved that gum disease is in no sense contagious, merely a physical condition caused by obstruction of sap, which may be brought about at any time by pruning or injuring the roots or trunk. Redwood stakes left in contact with roots, stones obstructing free flow of sap, roots intertwining, or any similar physical condition will cause the disease. Removal of the cause, together with furrowing vertically the trunk of the tree and oiling the bark to soften it, using neat's foot oil, will give satisfactory results.

Some had thought that the orange growers exchange would use the occasion to boost for itself, but any who "feared" such a calamity were soon set at rest. The California Fruit Growers Exchange is not in a position where it needs to take advantage of any such opportunities. One point, which is merely a statement of fact in Mayor Firey's welcome, was made that in the last six years the exchange has returned to the growers $70,000,000, with but a total loss of $5000. In the Pomona district 90 per cent of the growers are in the association.

Not content with the two days convention the Claremont Pomological Club gave a "Convention Echo" at Ganesha Park on Thursday. This was the regular fall picnic of the Club. Some of the good things left over from the convention were discussed at that meeting.

One unfortunate feature was the delay of Prof. Wm. T. Horne, pathologist, from Berkeley. Missing one train, he took another, arriving just after the adjournment. He was to have discussed root rot of citrus trees.

Chas. C. Teague of Santa Paula, and Mr. John Scott of Monrovia were elected honorary chairmen, but Mr. Jeffrey was able to preside at all sessions.

That 125,000 acres of bearing citrus orchards produce 30,000 carloads is an argument for those who maintain that there is decadence in the older orange trees. This output means only 100 boxes to the acre, and 100 boxes per acre, even at the prices prevailing for the past few years, does not mean profit under California conditions.

There are $125,000,000 invested in citrus properties in California, and this great investment is well worth the interest shown in the Pomona covention.

The decadence seems to prevail more generally with navels than with any other variety of oranges. Valencias continue to bear heavily though older than many of the navels.

Horticultural Commissioner Beers of Santa Barbara county reported some orchards in his county leased to careless tenants as one cause of decadence.

Santa Barbara county has the oldest commercial lemon orchard in the state, being 38 years old.

Does the Washington navel degenerate into an Australian as it becomes older and less vigorous, was one question asked at the convention.

The man with the free fans was strictly popular.

The demand for poultry seems growing constantly. Mr. P. Cook, of the Mammoth Hatchery at 3017 South Main street, has more than doubled his yards. He has now over twenty-five salesyards, mostly in an old orchard that affords splendid shade to the fowls. Nothing is kept in closed coops. His birds all have the best of care, there are thousands of the finest birds ever grown, and it is a marvel that they are sold at such low prices. Mr. Cook reports orders from Mexico City on the south and Tacoma, Wash., on the north, as well as from Utah and all the Pacific States. Mr. Cook is willing to contract for 50,000 White Leghorn pullets at fancy prices next year. Here is an opportunity for poultry raisers. The demand is especially great for the best grade of stock. Any one that wants fine birds at reasonable prices can surely find what they want at Mr. Cook's great establishment. His incubators have a capacity of over two thousands birds every week. His plant is now enlarged and will have a capacity of nearly 100,000 eggs. His new catalogue is worth having for the poultry secrets it contains.

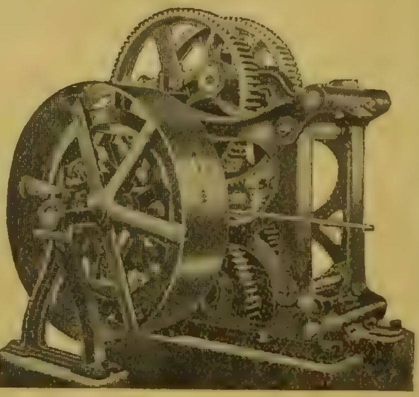
The Smooth Running Pomona Deep Well Pump



RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

REAR VIEW OF THE GREAT SUGAR MILL AT OXNARD.

California Mills can Slice 10,000 Tons of Beets Daily

It will be but a short time till California takes first place among the states as a beet sugar producer. Colorado is still claiming that honor, but California's increase is now so rapid that Colorado's production of seven and a half millions of dollars will soon be exceeded. Ten great mills with a daily slicing capacity of 10,300 tons are now in operation and another will be built at Anaheim which will be ready for next year's output of beets.

The United States consumes annually nearly three and a half million tons of sugar, of which nearly two millions is produced in Cuba and other foreign countries. The remainder is produced in island possessions or within our own borders. In fact the United States proper produces less than 500,000 tons. The consumption is increasing faster in this country than any other, and we are now consuming about 80 pounds per capita annually. With the greatest market in the world there is no reason why we should allow other countries to be greater producers. All countries save the United States and England produce their own sugar.

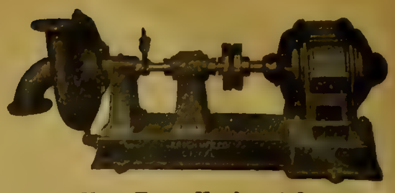
The first successful beet sugar factory in the United States was the one at Alvarado, this state. There is no reason why the number of factories like the above may not well be doubled here. Profitable as it is as a manufacturing industry it also means much to agriculture. Beet growers of Europe are now paid in excess of $200,000,000 annually. All this is made possible because of the remarkable achievement of Louis Vilmorin in transforming the common beet in a sugar beet.

This engraving of the Oxnard factory gives an idea of the manufacturing end of the industry. This is the second largest in the United States, the largest being the one at Spreckles. It is a rear view of the great mill. In the foreground are piled 500 tons of lime rock ready for burning. Thousands of acres of Ventura county are making possible happy homes because this factory handles their products.

New Type Vertical Pump

Does It Not Seem Reasonable

To Assume That a Company



New Type Horizontal

which has been manufacturing one line of goods for over thirty years must be in a better position to furnish superior goods than one which has been in business a few months or years? The old concern has experienced engineers, superior shop facilities and, above all, a reputation and standing to maintain.

Krogh Pumps Have Been Built for 33 Years

Our New Bulletin, C-12, tells about them.

Vol. XXXV—No. 13 Los Angeles, California, Thursday, September 29, 1910 Subscription $1 a Year

World's Raisin Supply 107,000 Tons Shy

Unfavorable Climatic Conditions Militate against European Output. Good Demand and Better Prices Anticipated

by George Robertson, Statistician, Fresno County, California

Owing to unseasonable weather in Europe, there has been a general failure of fruit crops of all descriptions, and consequently an increased demand, with higher prices and strong markets; as regards raisins and currants, the following figures speak for themselves:

	Year 1909. Tons.	Year 1910. Tons.
Spanish raisin crop	30,000	20,000
California raisin crop	70,000	56,000
Smyrna Sultanas	50,000	25,000
Greek currants	185,000	127,000
Total	335,000	228,000

These are provisional estimates made by some of the best authorities, but the final results are likely to be more or less correct, and show a deficiency compared with last year of 107,000 tons.

The Australian crop has not been taken into account, as the results will not be known until early next year, aand so far as this country is concerned it is too small to be a factor in the case.

In 1891 the California raisin crop first exceeded that of Spain, and since then has kept on increasing until in some years it has been more than double the quantity produced, by what for centuries, has been the leading raisin producer of the world.

California Raisin Crop, 1910.

In response to a number of circular letters sent out to the leading growers and others in all the principal grape-growing counties of the state, it appears certain that there is a shortage of about 20 per cent in the raisin crop at the present time, compared with last year. The following remarks are taken from some of the reports received:

Kings county—Present condition of raisin crop favorable, and 15 to 20 per cent larger than last year. Wine grapes also fully as good as last year.

Madera county—As regard size of crop, Seedless will be only half a crop, other varieties normal. Wine grapes estimated at one-third more than last year. Vine hopper very bad in places.

Napa county—Wine grapes only. An increased acreage of 400 acres over last year, 8483 acres in red wine grapes, 1497 acres in white wine grapes. The crop last year was large, this year not quite so heavy; grapes of fine quality and high percentage of sugar.

Riverside county—Raisin output small. Size of crop about the same as last year; condition good. Wine grapes,—condition good, size of crop considerably better than last year.

San Bernardino county—The raisin crop will be fully up to normal.

San Diego county—In the El Cajon valley and surrounding country the condition of raisin grapes is good, but 30 per ecnt below production of last year. The berries will run small, and will show at the stemmer a rather large proportion of 2 crown. In the Escondido district the raisin crop is reported normal.

San Joaquin county—Wine grapes only; condition fair to good, but lighter crop than last year.

Yolo county—Fair crop of Sultanas and Thompsons, Muscats small berries, crop probably 15 to 20 per cent short . A lively trade with San Francisco is developing, taking daily shipments of Thompsons and Muscats for table grapes, hence raisins are becoming less from year to year.

A YOUNG RAISIN VINEYARD IN SAN JOAQUIN VALLEY.

Fresno county—As is well known, Fresno is the center of the raisin-producing district of California, and on an average produces about three-fourths of the total crop. The majority of the reports this season are unfavorable, and estimates vary, the shortage compared with last year being variously estimated at from 10 to 25 per cent, some estimates as high as 30 per cent.

All these reports were made within the last two weeks, and before the recent rains, which cannot fail to influence the situation. Weather conditions are now in control, so that it is impossible to state with any accuracy what the total shortage will be when the crop has been secured.

A number of correspondents in some counties have requested more time before sending in their reports, but sufficient data has been received to enable the general conditions to be ascertained. It is not for me to prophesy what prices are likely to be; by duties end when I present facts and figures, and it remains for those who take the trouble to read and study these statistics to draw their own conclusions.

The Raisin Crop of the World.

	Spanish Tons.	California Tons.
1904	25,000	40,000
1905	28,200	37,000
1906	15,800	45,000
1907	27,000	70,000
1908	25,000	65,000
1909	30,000	70,000
1910 (estimated)	20,000	56,000

In previous years the California crop was 47,000 tons in 1900, 37,000 tons in 1901, 63,000 tons in 1902, and 60,000 tons in 1903.

	Smyrna Sultanas Tons.	Greek Currants Tons.
1904	34,100	151,000
1905	58,300	160,000
1906	27,500	135,000
1907	47,000	156,000
1908	45,000	185,000
1909	50,000	185,000
1910 (estimated)	25,000	127,000

Australian Crops.

In addition to the above, raisins and currants are now produced in Australia in the following quantities:

Raisins

Season.	Victoria. Pounds	S. Australia Pounds
1901-2	3,085,665	822,080
1902-3	3,979,798	1,294,944
1903-4	5,986,060	1,463,056
1904-5	3,393,117	974,064
1905-6	4,813,240	1,334,928
1906-7	10,990,224	1,805,776
1907-8	7,685,104	2,742,656
1908-9	7,688,032	3,136,784
1909-10	Not yet issued.	

Currants

Season	Vitcoria	S. Australia
1901-2	285,157	382,256
1902-3	416,890	547,232
1903-4	838,955	1,165,472
1904-5	669,108	1,423,968
1905-6	717,156	1,629,824
1906-7	1,313,760	1,608,432
1907-8	1,169,280	2,235,184
1908-9	1,336,048	2,738,288
1909-10	Not yet issued.	

In New South Wales, Queensland and Western Australia also, small quantities of raisins and currants are also produced.

Cape Colony, in South Africa, also produces a small crop of raisins, but only a few million pounds.

California Seedless Raisins.

The exact proportion of Seedless, compared with Muscat raisins has never been determined, but in 1903, when the California Raisin Growers' Association claimed to hold 90 per cent of the crop, out of 97,011,106 pounds delivered to them, 6,314,271 pounds were seedless, viz.,—Thompson, 1,484,214 pounds, and 4,830,057 pounds of Sultanas.

Prices in Recent Years.

Unfortunately, no regular record of the price of raisins and other fruits has been kept from year to year, as they would be very valuable for comparison.

Deliveries to Growers' Association.

1899	2.019.298.32
1900	2,672,784.12
1901	1,648,178.12
1902	3,103,101.78
Average for first five years	2,149,220.53
1903	2,240,415.90

In 1905 the California Raisin Growers' Company paid the growers who delivered raisins to the company, $1,205,546.00, or an average price of 3 cents in the sweat box.

Since 1905 the general sweatbox price per pound has been as follows.

Year.	Highest. Cents.	Lowest. Cents.
1906	6	2
1907	6	1¾
1908	4	1¾
1909	2¾	1¾
1910, Jan. to Sept.	3½	2¼

In 1906 prices touched 7 cents in a few cases; in 1907 prices opened good but fell owing to the financial panic. These quotations do not refer to prices paid under contract for a number of years, or to special deals.

Continued on page 311.

Citrus and Tropical Fruits

FUMIGATION.

THE state experiment station has been interested in the fumigation problem from the beginning and, while no special funds have ever been available for a thorough investigation of the problem, yet considerable work has been done and several publications issued on the subject. In these bulletins are to be found the source of several phases of the problem that have been more recently put to practical use, including the marking of tents, the calculation of dosage and the basis for this calculation.

During the past three years the federal Bureau of Entomology has had an agent here in the field, investigating the problem largely from the practical field side. Mr. Woglum has done some very good work in the establishing of dosage schedules for the different scale insects, based upon field conditions; his campaign for accurate measurement as against guess work, and his investigation of sodium cyanide and new tenting materials are of great value to the citrus industry. I have kept in touch with Mr. Woglum's work from the beginning and shall feel free to draw upon his data. In spite of all of this work done on fumigation, and I have not mentioned what many practical fumigators have added to our knowledge of the subject, much yet remains to be investigated.

Variation of Dosage.

Seven or eight years ago the experiment station had a man in the field for the purpose of determining the actual practice of scheduling dosage. Practically all of the fumigating outfits then operating in the state were visited and the tented trees accurately measured and the doses given them by the scheduler recorded. Thus the dosage and measurements of over 2,000 trees were made, representing the actual practice of 30 fumigators.

From this study it was found that for a 10 foot tree, having the two dimensions approximately equal, the dosage varied from 2 to 7½ ounces. And for a 20 foot tree the variation was from 7 to 32 ounces. This certainly is evidence enough without further argument in favor of some system of measurement or accurate calculation of dosage as against the old system of guessing.

Factors in Variation of Dosage.

Now there are three factors that account for the great variation of dosage. First, there is the inaccuracy of judging the exact size of the tree, and the consequent dosage. Second, there is the difference of opinion of different fumigators as to the dose a particular sized tree infested with a particular scale should have. For example, take a tree infested with red scale that measures 20 feet over the top and 30 feet around the base; one man will say it should have 4 ounces, another 5, another 6 and another 8. Thus there may be a variation of 50 per cent for the same tree infested with the same insect. Third, there is the variation in dose as the size of the tree varies. For example, we will assume that all fumigators agree on, say, six ounces as the proper dose for a tree 20x30 feet. Then for a tree twice that size the same people will vary their dose from 10 to 30 ounces. This is a difference in basis of calculation, or variation as the size of the tree increases or diminishes.

The first two of these factors are easily remedied. The exact size of the tree can be ascertained by some system of measurement; and there should be a general agreement as to how much cyanide is necessary to kill the different scales. But the third factor, namely, varying the dosage properly according to the size of the tree is a more difficult and complicated question.

Basis for Dosage.

The first dosage schedule published was based upon the cubic contents. This, naturally, would be the logical basis for calculation. But in actual practice it was soon found that a large tree required a dose proportionately less than a smaller tree. This is accounted for through the leakage of gas, and a small tree has more tent surface per unit of volume than a larger tree. So, many widely different schedules were proposed until finally actual field practice established a more or less elastic schedule with the approximate proper variation in dosage according to the size of the tree.

Area Basis.

This has worked out into practically an area basis rather than a volume basis, that is, trees receive a dose according to the area of their tent surface rather than the cubic content of the tented tree. This basis of dosing a tree according to the tent surface was proposed by the experiment station in 1903, and is the one adopted by Mr. Woglum.

Tables and Calculation.

Instead of elaborately figuring out a dosage table by first calculating the cubic contents, and then allowing for the variation in leakage of gas with the different sized trees, as Mr. Woglum has done, the following is a very simple formula by means of which any one can construct his own table. This formula is simply to multiply the circumference of the tented tree by the distance over the top and point off two places. The result is the number of ounces of cyanide for the given tree for the purple scale.

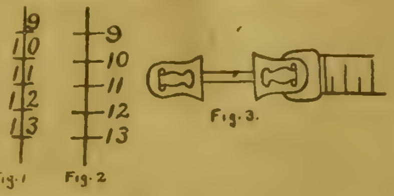

Fig. 1. Original design for making fumigation tents. Fig. 2. Design generally used in California. Fig. 3. "Washburn" clamp attached to end of tape for attaching tape to tent at any point.

Examples—A tree 20x30, 6 ounces cyanide; a tree 30x40, 12 ounces cyanide.

This, as I have stated, is the schedule for the purple scale and corresponds in general with Mr. Woglum's table. Now for the red and yellow scales, or for the black scale, excepting where it is full grown, reduce this schedule by one-fourth.

Examples—A tree 20x30, 6 ounces for purple, 4.5 for red; a tree 30x40, 12 ounces for purple, 9.0 for red.

Chemicals and Formula.

As to the chemicals little need be said except that the acid should indicate 66 degrees Beaume or 93 per cent pure, and be free from nitric acid which may cause burning. The potassium should be of 98-99 per cent purity and be free from sodium chloride which, if present, will decompose a part of the gas.

Sodium Cyanide.

Mr. Woglum has demonstrated that sodium cyanide is equally as satisfactory as the potassium, both in generating properties and efficiency in killing the scale; and since it will be apparently cheaper than the potassium it seems probable that it will sooner or later come into very general use. Heretofore, the experience with sodium cyanide has not been satisfactory for the reason chiefly, that the product was not pure enough. What has been passing for 98 to 100 per cent sodium cyanide has been a 98 to 100 per cent purity in terms of potassium cyanide, whereas if we accept potassium as a basis of purity, the sodium cyanide should be 126 to 133 per cent pure. It is unfortunate that this above-a-hundred per cent purity should have got started, but since we are accustomed to potassium as a standard possibly it is justifiable. Anyway, all we need to know is that a pound of chemically pure sodium cyanide contains about one-third more cyanide or cyan-

John Meyer, known as the "Louisiana Orange King," estimates the new crop of Louisiana oranges at 300,000 boxes.

ogen than the potassium and will thus produce more gas.

Formula for Sodium Cyanide.

Since there is more cyanide or cyanogen in a pound of sodium cyanide than in a pound of potassium cyanide, it will require a proportionately greater amount of acid. One of the uses of water in the generation of hydrocyanic acid gas is to dissolve the residual sulphate, and thus prevent it from coating the cyanide not yet generated or reached by the acid. In the case of sodium cyanide there is approximately one-third less of the sulphate formed, and consequently the water may be reduced about one-third.

Therefore, the proportions of cyanide, acid and water will differ in case sodium cyanide is used, and the formula that has been found to be satisfactory is:

Sodium Cyanide....1 part by weight
Acid ....1½ parts by volume
Water ....2 parts by volume

It should be noted that in case sodium cyanide is used all dosage tables should be reduced one-fourth.

Adulterants.

The commonest adulterant of cyanides is sodium chloride or common salt, and this is likely to get into sodium cyanide, particularly, in large amounts. The presence of this salt produces a reaction in which hydrochloric acid is formed and this acts in turn directly upon the hydrocyanic acid gas, thus decomposing it. In order to avoid this adulterant a high degree of purity should be insisted upon, and this stated in terms of the potassium salt should be 124 to 133 per cent pure.

Comparative Cost of Sodium and Potassium Cyanide.

A good sodium cyanide can be bought for 27 or 28 cents per pound as against potassium at about 25 cents. It requires a little more acid for the sodium so that the acid bill is higher and the cost per pound of cyanide is higher. But since one pound of the sodium will generate as much as one and a quarter pounds of the potassium, the cost is really in favor of the sodium cyanide, and this, if calculated out, will be found to amount to from 1½ to 3½ cents per pound.

Tighter Tenting Material.

One of the greatest losses in any commercial operation that I know of is the loss of gas through poor tenting material. This loss amounts every year to thousands of dollars, and it is surprising that the resourceful people of Southern California have tolerated it so long. I am well aware of many attempts to prevent leakage of gas through treatment of tents and so on, but even simply a little correspondence with the manufacturers of ducks and drills has brought out a tent that is infinitely tighter than anything heretofore on the market; and Mr. Woglum estimates that such tents will require only about one-quarter as much cyanide as the older materials. I believe that we ought to do still better than this, but a reduction of one-quarter in the amount of cyanide will mean a saving of more than $100,000 each year. Probably there is no insect any harder to kill than the mealy bug, and in some cases double doses and double tents have failed to kill them, yet in an absolutely tight box with an ordinary dosage I have been able to kill all stages, including the eggs, in only ten minutes exposure.

To summarize I would advocate: The measurement of tents or other means of accurately calculating the dosage, the use of sodium cyanide, providing those making the change from the potassium thoroughly understand all the points incident to that change, and, finally, in the purchasing of tenting to get the tightest possible material, for even then there is still too great a leakage of gas.

C. C. Chapman, one of the big and leading citrus growers of the state, whose home is at Fullerton, wife and daughter, and son-in-law, Dr. Wm. Wickett, returned recently from a thirteen weeks' tour of Europe, during which time they visited horticultural points of interest in France, Italy and other parts of Europe.

THE OLIVE CROP FOR 1910.

The Fresno Republican says that with the olive crop in Europe practically nil, and with a very large shortage in this state, high prices to growers are being paid there, though the crop is almost cleaned up from first hands, and record prices are expected for pickled olives and olive oil this season. Growers are being paid $40 per ton for oil olives and $80 per ton for pickle goods. This is an average of $5 and $10 per ton more than is paid in the average good year. In fact, with better figures paid for certain desirable blocks of goods, this makes something like a high record for olive prices to growers in this state.

The crop in this section of California is from one-third to one-half short of the average. In Southern California the shortage is figured at a third. In the northern part of the state there are practically no olives.

Authoritative advices from Spain state that the crop there is 97 per cent short, which means there is practically no crop.

There has been much buying here by olive product manufacturers, and it is stated that there is very little crop left to be bought up.

The price of case goods has advanced from $2.25 to $2.50, but this is believed to be only the beginning of a very sharp and extensive advance in values. In fact, with spot stocks very light, in Fresno and Los Angeles, it is believed the pinch of the shortage will be felt in about two months, and things are then expected to take an upward swoop.

The rains of a few days ago developed the fruit here to a considerable extent, and picking will begin right away. The process of making oil and pickles will start immediately thereafter.

OLIVE CROP SHORT IN SPAIN.

Latest reports from Andalusia are to the effect that this year's crop of olives will be one of the poorest on record, due to the circumstances mentioned below. The weather conditions this year have not conduced to the development of the olives, bitterly cold weather having been experienced quite late in the spring, which destroyed large numbers of the small olives. Further, the lack of sufficient rain when neecssary and the continuation of the hot dry summer weather has destroyed all hope that the small number of olives still surviving will come to perfection. It is estimated that the crop of Queens will be practically nil, that of Manzanillas poor in quantity, quality, and size, and that of the oil-producing olives also poor. Owing to the abnormally large crop of last year and the large stock on hand, the dealers do not anticipate any shortage, though it is possible that prices will be higher next year than at present.

Advices coming to The Cultivator from Limona, Florida, are to the effect that the coming crop will be very light. This in view of the fact that the California crop just at this writing gives promise of being unusually heavy, assures a good market at fair prices the coming season. Somehow or other Nature is after all a great leveler in her dispensations. If crops were bounteous and good everywhere all the time, there would be no good prices, and the element of chance so far removed as to cause the game of fruit growing and selling to become tame. The following paragraphs show present prevailing conditions in Florida:

At Ft. Myers—crops are not as good as last year, only a fair crop of both oranges and grapefruit is assured.

At a recent meeting of the growers at Bartow, it seemed to be the general opinion that not over one-fourth of a crop would be harvested. Homeland will probably have one-third, while Winter Haven's crop will come nearly up to last season.

The orange and grape fruit crops at White City owing to the drought, will not average over 60 per cent. The fruit is growing well, and most of it looking fine.

Like the rest of the counties in the orange belt, Volusia will not market over a half or two-thirds of a crop the coming season.

Hulled
Melilotus Clover

Produces 15 to 20 tons green manure to acre. Has heavier root system than Burr Clover or Vetch. At the prices we quote it is the cheapest of all. Write for prices and pamphlet entitled,

Tree and Shrub Fruits

A DECIDEDLY POPULAR BERRY.

Among fruits of California introduction not one has won a stronger following than the Loganberry. Its importance to commercial horticulture is indicated in the fact that the Sebastopol Berry Growers' Association has alone marketed 183 tons; this is probably the largest output from any one district, hence the aggregate crop of the entire state must have been in excess of any other bush fruit, with possibly the exception of the different varieties of blackberries as a whole. The reason for this popularity is that the vines are heavy croppers, the fruit is a good shipper; and finally, that it possesses a fine flavor, both in the fresh state and also when made into pies and sauces.

THE LOGANBERRY: A CALIFORNIA FAVORITE.

Touching its history, we quote from "California Fruits and How to Grow Them:" "The Loganberry was originated by Judge J. H. Logan, of Santa Cruz, and is a cross between the California wild blackberry and a red raspberry, thought to be the red Antwerp. It was a chance hybrid developed by growing plants from the seed of the wild blackberry in 1881. The plant was multiplied by its originator and fruited for more than ten years, plants being meantime given to Mr. James Waters, of Watsonville, who grew it on a commercial scale and was gratified at the results of his marketing of the fruit. The variety was first given to the public through the University of California in 1893 and has since then been propagated by nurserymen and sold in large quantities. It has proved a most valuable fruit in all parts of California, and has commanded the attention of pomologists and growers all over the world. The Loganberry is an exceedingly robust grower, and has unique foliage and cane growth as well as fruit. The fruit is strikingly large and handsome; sometimes an inch and a quarter long, with the shape of a blackberry, and sometimes the hue of a dark red raspberry. Its flavor is unique and peculiar, and gives to many tastes suggestions of the combination of blackberry and raspberry flavors. The culture of the Loganberry is like that of the dewberry—both in growth and propagation, rooting readily from cane tips without covering, unless many plants are desired and then a covered cane will root at each joint."

APPLES PAY.

It used to be acknowledged, even by the natives, that much of California could not produce apples that would be commercially a success; however, some exceptions have lately been noted; the Belleflower and the Winter Permain have won for themselves a place, and are now acknowledged as very remunerative. The Gravenstein has also been mentioned as an apple that is able to lift a mortgage.

As yet I have not seen any mention of the Rhode Island Greening. That apple is, as is well known, the equal of all apples as a sauce and pie maker. I have two trees on my place at Burbank, Los Angeles county, just at the foot of Mt. Verdugo. The elevation is about 800 feet, soil decomposed granite or ideal orange land. Seven years ago when I bought the place these trees that are now not less than thirty years old, were all but dead, the sap suckers had so drilled them that it was hard to find a place as large as the end of one's finger that had not a hole in it. I tied up the trunks and large branches, shot as many of the vermin as I could and saved the trees. The trees have had no special care, and as far as I know have never been fertilized. This year I sold forty boxes from those trees at sixty cents a box or two cents a pound, netting twelve dollars to the tree. The apples were large and of fine quality and were in great demand. I am convinced that with proper cultivation of apples when the right apple is planted and given as much care as

Plows

You don't buy a plow for speculation—you want it to dig dollars out of the ground with it.

A good plow means good work; good work means more dollars.

No one ever heard of a better plow than the Deere—because there is no better plow.

Plowing is a steady, all-day pull; if the pull is too heavy the team is soon jaded and loses its proper capacity for work.

Deere plows do not "drag" the horses. They pull light because they are shaped right—easily handled because made right—outlast others because the best materials that can be put into a plow go into the Deere.

Made in styles for every plowing purpose.

Deere Cultivators, Deere Harrows, Deere Cotton Tools and all other Deere implements are of the same high class.

Harrow While You Plow

With the world-famous Kramer Rotary Harrow Attachment. Awarded Gold Medal and Diploma at A. Y. P. Exposition, Seattle. Also Diploma by Dry Farming Congress Convention. First on the market. All others are imitators. Over 50,000 sold.

The Kramer Attachment is recommended by the leading Departments of Agriculture, and is so light-running that your team will never notice the additional draft. Can be attached to any gang or sulky plow. Mulches the ground to any depth and produces the Ideal Seed Bed. Combines all the functions of Harrow, Packer and Pulverizer.

Skim-milk is thin looking stuff, but it may be put to good use in the poultry yard.

oranges, that the returns will be at least as large as from the best orange grove, and in the hands of the average man will far outstrip oranges. They will do with far less fertilization. One irrigation a year or at most two is sufficient. Less skill is needed in growing and marketing the crop.

The Greening bears a crop every year and with me so far an increased one each time. Still I do not expect quite as large a crop next year. I would advise those whose oranges do not bring satisfactory returns to plant apples.—J. C. Oestergard.

SPRAY INJURY.

In a report recently made by Horticultural Commissioner W. H. Volck of Santa Cruz county, he refers to serious injury to apples affected by the use of a form of arsenate which has lowered the grade in many orchards. Mr. Volck says:

"By far the most serious matter of interest to the fruit grower is the arsenical injury which has developed in a considerable number of orchards which were sprayed with an imported brand of arsenate of lead known as Sherwin-Williams (new process) arsenate of lead. In many cases this spray injury has been so serious as to reduce the value of the crop all the way from 5 to 20 per cent and in addition jeopardize the next year's crop by weakening the fruit buds. A conservative estimate of the damage over the entire valley and elsewhere in Santa Cruz county is about $150,000. This damage was done by a carload of arsenate of lead, the total retail value of which at 12 cents a pound is $3600.

"My report for July, 1910, contained a statement of the chemical and foliage tests which eight had previously made of this arsenate of lead, and that the sample had been found too injurious for me to recommend its use in the Pajaro valley or other districts having a similar climate. The cause of the injurious action of this and many other brands of arsenate of lead is that too much arsenic is present to properly combine with the lead in the insoluble or ortho-form. Also the process of manufacture of a well-known brand has not been suhc as to insure that any of the arsenic is gradually soluble in water, especially when exposed to the action of the air. The fogs and dews so abundant in the Monterey bay cliamte expose any material applied to the leaves of trees, in this district, to long continued action of water and air. As fast as the arsenic is dissolved it is taken up by the leaves through the pores and any abrasion of the skin which may exist. Once inside the leaves the arsenic begins to poison and kill the cells. and the amount of injury depends on the quantity of poison taken up and natural strength and resistance of the leaves.

"The condition just mentioned makes it possible for the same spray-material to produce very widely different degrees of injury in different orchards or on different varieties. In order to spray with safety under the climatic conditions of the Pajaro Valley the arsenical must be such that it will stand the test on the most delicate foliage and under the most exacting conditions."

WALNUT CROP IN FRANCE.

From Vice Council Murton located at Grenoble, France, we have information that the weather condition in the French walnut growing districts have been such that the crop of nuts and of fruits will be very light. All standing crops have suffered more or less from the effects of this abnormal situation, fruit especially, which is rare and dear in consequence. As an example, cherries which last year retailed at 2 to 3 cents per pound have sold this year for 6 to 12 cents. The same proportions exist for all other kinds of garden or orchard fruit.

"The outlook for the forthcoming yield of walnuts is not encouraging. The cold and frosts of early spring, just when the fruit was budding, killed large quantities of all varieties of nuts and retarded the development of those that survived. But the trees have since recovered and look prosperous and green, while the nuts remaining appear to be well formed and fairly large. However, for the proper maturing of the fruit warmth and sunshine are essential up to harvesting time, which should be, as usual, about October 15.

"The crop of 'Mayettes,' or table nuts, is variously estimated at 8,000 to 12,000 bales of 100 kilos each (100 Kilos = 220.46 pounds). From personal inspection of the region I am inclined to believe that the latter figures will be fully realized. However, the yield will probably not much exceed a third of a good average crop. The same is true of 'Chabertes,' or small nuts, used in the United States exclusively for confectionery purposes, of which it is expected that not more than 12,000 to 15,000 cases of 25 kilos each will be available for exportation, as against 30,000 to 35,000 cases last year.

"In consequence of this shortage it is generally believed that this year opening prices will rule high. In the meantime it does not appear that any contracts have yet been made for forward delivery, both buyers and sellers holding aloof from the market."

Many of the ranchers in the Yuma (Arizona) valley have cut and stacked their second crop of alfalfa seed and are now patiently awaiting the thresher for the second time.

NITROGEN.

According to Dr. Edward B. Voorhees, the present annual consumption of fertilizers, as near as can be estimated, is 5,000,000 tons; which at $29 per ton makes a total of $145,000,000. On a basis of 3 per cent ammonia, 8 per cent available phosphoric acid, and 5 per cent potash this would be divided as follows: Nitrogen, 48 per cent or $69,600,000; phosphoric acid 32 per cent or $46,400,000; potash 20 per cent or $29,000,000.

Taking as a basis the experience of the New Jersey Experiment Station found in actual field tests extending over ten years, it was proved that on account of the greater availability and lower cost of nitrogen in nitrate of soda as compared with the best form of organic nitrogen—namely, dried blood—had all of the nitrogen used in the state the previous year been applied as nitrate of soda, there would have been a saving of $383,900 to the state. Then on this basis the whole country could have saved $17,000,000 in the year in this way.

All this too was on the basis of the best form of organic nitrogen, while as a matter of fact much of the lower grades and more difficultly available forms are used.—R. R. Snowden, Chemist and Soil Engineer.

But it must be remembered that in fact, if not in theory, nitrogen from organic sources with its increased bacterial activities gives an advantage which a chemical fertilizer cannot. The action of nitrification sets free certain organic acids which have power to dissolve more or less additional plant food. Chemical content of a soil is by no means an indication of its productivity. There are many factors which must be considered in soil fertility.

It will soon be time to consider the necessity of spraying peach and plum trees, and the grower who is casting about for effective spray material will do well to investigate the worth of the Rex Spray. This spray is not one of the catch penny affairs, but is simply a commercial solution of the lime-sulphur so compounded as to be almost perfect in its action. The Rex people have put this material on the market for several years and its popularity is constantly increasing. The same company also puts out an arsenate of lead and a sulphide of arsenic regarding which it will send particulars

Improved Babcock Tester

Babcock's Milk Tester, an extremely simple, light, compact and carefully designed apparatus, especially adapted for use in the dairy and also on account of its light weight to the Traveling Dairy Inspector.

The working parts are entirely enclosed in a handsome cast-iron case, and consist of but two cut gears, namely, bronze spiral gear and steel spindle with worm thread.

The Tester is fitted with swinging pockets and malleable iron head; it turns very easily without any vibration or jar and can be readily attached for operation to any table or bench. The bottles are perfectly horizontal when rotating.

	Wt.	lbs.
No. 1, 2 bottle for milk	14 each	$5.00
No. 2, 4 bottle for milk	14 each	6.00
No. 3, 2 bottle for milk,		
No. 4, 4 bottle for milk, and cream	14 each	5.50
No. 4 4 bottle for milk, and cream	15 each	7.00

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, pipette and test bottles.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

CALF DISEASES.

By Mrs. M. E. Sherman.

A disgusting disease in calves is Verminous Bronchitis, or as it is more commonly called worms in the lungs. The trouble is not widespread in the state and with ordinary care in inspecting calves at shipping points is not to be greatly feared. A few years ago a number of calves were brought into Fresno that were affected with this trouble. It was, however, quickly stamped out in the one season by the county officers. The trouble is easily discovered and unmistakable that there is little danger of its being overlooked.

Symptoms.

The calves cough and choke, raising masses of frothy mucus, that they deposit in great piles on the ground. When this mucus is closely examined it is found to be full of tiny white thread-like masses, sometimes these twist up into little balls. If a small portion of this mucus when first expelled, is floated in a basin of warm water these little threads are seen full of life as they move around. These worms are living and moving in the lungs of the calf. The trouble is very infectious and is taken by the calves from the ground rather than from each other. The way it was stamped out in this county was by not allowing any other stock placed in the infected fields, limiting the disease to those that already were infected. Prof. Laws treatment by having the calves inhale sulphur fumes proved valuable. The calf is placed in a closed box and a small piece of sulphur rag is burned. All the calf can stand without choking is used. Then the box is opened and the calf is allowed to breathe fresh air for ten minutes. Then the treatment is repeated; about five treatments are enough at one time, they may be repeated after two days if the first was not sufficient. Sulphur rag is prepared by dipping strips of clean old muslin into melted sulphur and then hanging them out to dry. A piece ten inches long and four wide makes plenty for one burning.

Chloroform.

The other successful treatment is by using chloroform. At first this was used by making an opening in the side of the throat and putting in the chloroform fumes directly into contact with the worms. This operation was costly and many of the calves died from want of proper nursing after the worms had been destroyed. The very bad cases were sure to die from weakness and those not too weak could stand the simpler way of using chloroform. I think, today, the following is almost the universal way of treatment. The calf is held securely and a tablespoonful of chloroform is poured on a piece of absorbent cotton. It is then held firmly to one nostril. One only, remember. A piece of cheese cloth is held over the cotton to prevent evaporation while the animal inhales it into the lungs as a vapor. The treatment should take place every day for four days and then the calves watched for any returning of the trouble. They frequently reinfect themselves from the pasture. As soon as all the animals are found to be well, they should have another pasture field. The pasture they come from, should be abandoned as a place for cattle. When the season comes around it may be plowed up and a crop that is cultivated put on it. At least two seasons of rain and sun should purify it before it is again used for animals.

Mange.

There are many calves that are thin and poor looking from attacks of mange. It is really more of a calf trouble and disappears after the animals are two years of age. Mange is a fungus or vegetable organism that lives on the surface of the skin. It buries itself under a crust that must be removed if the treatment is to be successful. Mange produces intense itching and the calves affected seem to be in constant discomfort, they keep moving all the time from place to place to secure a little ease. The surface of the skin is covered with small white pustules or pimples that break, allowing a thick tough mucus substance to escape. White looking crusts form more like a scurfy dandruff, that sheds off from time to time. The trouble is very contagious and must be handled promptly if the calves are to be kept growing thriftily. The trouble is not hard to cure if the medicine can be gotten on to the trouble. The thick crusts are very repellant and must be removed completely. A pound of good strong laundry soap is put into a gallon of water and placed on the stove, when it has melted down into a jelly, half a tablespoonful of strong carbolic acid is stirred in. The calf must be tied up well and then the soap daubed on over every spot of mange. The soap should be left on until dry, then soak it off with very warm water and usually the scurf will come off with the soap. Clip any hair that comes up close to the mange spots as they may conceal a little spot that will again start the trouble. After the spots are clean, wipe them dry with a piece of absorbent cotton and paint the surface with the following mixture.... Three ounces of hyposulphite of soda, one ounce of dilute sulphuric acid, fifteen ounces of water, put it on well and let it dry on. Repeat the mixture every day and if scurf appears wash again with soap. Usually a week of treatment will heal the places.

Ringworm is a common disease and will yield to the same treatment. This appears on the heads usually, and is round in appearance. Sometimes, however, ringworm is very stubborn and then after using the mange treatment for a week, follow the case up by painting the spots with tincture of iodine for a week longer. It must be also remembered that these two troubles induce much rubbing and scratching. The trees, calf high, and the fences should be whitewashed to kill any of the infection that may remain. The stables and stalls where any disease has been should always be well whitewashed to make it all sanitary.

Lice.

In springtime these pests thrive best and are forced on the notice by the bare looking places that appear on the cows and calves rumps. The back of the head, the shoulders, roots

AMERICAN STEEL PIPE & TANK COMPANY

349 Pacific Electric Building **Los Angeles, California**

of the tail are usually most infected. The simplest remedy is to buy linseed oil and apply with a whitewash brush and then in seven days repeat the application. If this is thoroughly done there will be no further trouble from lice that season. It always seems foolish to feed lice, for that is what we are doing, for they eat the food after the cattle have prepared it for themselves, making a double waste of cattle energy. The oil will also destroy any ticks that are on the cattle and clean them from any other form of crawling insects—as chicken lice.

Black Leg.

It is only a few years ago that the losses in the river regions were heavy from black leg. Then the Government took it up and found a vaccine that has proven itself entirely successful. The loss of calves has been reduced from 12 per cent of all the calves to less than 0.46 per cent. The vaccine can be purchased and used by anyone that has ordinary skill and is clean in their work.

Disease.

The elimination of disease makes cattle stronger—for a sickly calf rarely makes a desirable cow. The human family has been slow to apply this lesson to itself and the devitalizing influence of illness was not full appreciated. The dear old-time mother thought the children were sure to have the measles and deliberately sent them to catch them, when it would be convenient to have the illness. The time of soap making, house cleaning, butchering was not propitious and if the children did not have their disease before these important events in the household calendar, it was serious. The mothers of today should sing for joy that they are relieved of the necessity of having the children suffer. The control the world is securing today of disease makes one wish they could see the splendid race that a hundred years from now will occupy our places.

IN THE SALT RIVER VALLEY.

Writing of the Salt River Valley an Arizonian enthusiastically said: "Here in the Salt River Valley the visitor may drive in a day past a hundred thousand acres, all green with grass, alfalfa, vines, and fruit trees, and to every acre has been diverted water in needful and true proportion. Up toward the highland is seen the line of a great canal, upon which boats might be run. Above it lies the "desert," a gently-sloping plain, covered with dark-green creosote bush, with here and there a beautiful ironwood tree, or a curious palo verde, the latter in the spring time a huge bouquet of yellow blossoms. The fluted columns of the saguara, the giant cactus, bear aloft crowns of white flowers, while the buds of the broad-bladed prickly pear unfold to blooms of brightest red.

CONTENTED CATTLE GRAZING IN SALT RIVER VALLEY, ARIZONA.

"Below the canal, sharply in contrast, lies the land reclaimed. From every canal run scores of laterals, fed through gates over which the water-tender keeps a jealous eye. These laterals again divide, each branch to its own farm of whatever size. Out on the fields, bare-legged laborers receive the tide with welcoming shovels. In between long borders of earth, the water is diverted, till each bordered section is in turn well covered, and the irrigation is done. In this valley, so level is the land and so uniform is its gentle slope, that the task is usually unattended with any problem of how to make the water run up-hill. In the orchards and vineyards the water is conducted into furrows plowed in the well-loosened soil, and thus to every tree and vine."

And we don't blame the writer for his enthusiasm. The Salt River Valley is all right.

FISTULOUS WITHERS AND POLL EVIL.

These two affections are practically the same, except as to the location of the disease. As the name indicates, fistulous withers is a disease of the withers, and poll evil is a disease of the top of the head, or the poll. Both are caused by a bruise.

One will first recognize the affections by a swelling on the withers or the poll, at first, hot, hard, and tender, later cold, soft, and not very sensitive to the touch. In the course of a month from the first appearance of a swelling, the enlargement breaks and pus discharges througm an opening later called the fistulous opening. The abscess cavity will be emptied and then the fistulous opening will close until the cavity refills, only to open again and discharge the contents. This filling and discharging of the abscess will continue indefinitely until the animal receives proper treatment. The pus will work its way through between the layers of muscle and form tubes of fistulous canals. These form where the disease has reached the chronic stage. After the trouble has become chronic the horse is greatly reduced in flesh, and in many cases of poll evil the head is held stiffly; while lameness is quite pronounced in fistulous withers. The disease usually runs a chronic course of from three months to four years. In the worst cases of poll evil the large ligament back of the head is necrosed, and in fistulous withers quite frequently the scapula (shoulder blade) has the periosteum completely removed over a large area, thus delaying healing. The bones of the neck and over the top of the vertebrae of the withers are uncovered and nave the appearance of bones that have been boiled.

Treatment.

The pus cavities should be opened and all the fistulous tracts given free drainage. Disinfectants to kill the pus germs should be used in large quantities, keeping the pus out as much as possible. The latest treatment is the use of anti-suppurative vaccine, which has given very satisfactory results.—C. L. Barnes, Colorado Agricultural College.

WELL BRED AND WELL FED.

Now is the time to begin looking for good stock to place in your hog herd. The sooner you buy after weaning the better bargain you will get for your money, as a breeder can afford to let you take your pick just after weaning at a price that he will ask you later on for a bunch that has been all picked over. Feed and care mean money to him as well as to you, and the earlier he can turn his pigs the better bargain he will give you as a rule. There is no sense in raising just ordinary hog that shows his scrub ancestry in all his make-up, when you can buy pure bred sows that will fatten easily and be smooth when fattened at from $15 to $30 per head. The first crop of pigs will pay the extra cost of the sows.

And when once you have bought good young stuff, don't put it out on pasture without a bite of grain and let it stunt. If there is anything that tries the good nature of a hog man, it is to sell good stuff to some one who starves it and then comes back with the complaint that it is not doing well.—Ranch and Range.

FARMERS INSTITUTE.

Napa Grange No. 307 is a "live one" in every way and in the matter of the Farmers Institute conducted by the State University the grange has busied itself in adding to the regular University program with music and other features by local talent. In addition an exhibit of Napa county exhibits for which cash and other prizes will be awarded will be a feature.

The Institute is for two days, October 3 and 4.

Raise Beans

Santa Ynez Valley Lands are located in Santa Barbara County—40 miles north of Santa Barbara. No better bean land in California. This district produces phenomenal crops every year. Amount of work and investment considered, beans are one of California's most profitable crops. World-wide market.

Income $95 Per Acre
No Irrigation Required

The lowest average yearly yield on Santa Ynez Valley Lands exceeds 23 sacks (approximately 2100 pounds) per acre. Average crop worth over $95 per acre. Cost of seeding, cultivating and harvesting about $10 per acre. Land also good for apples, walnuts, potatoes, garden, seed, etc.

No irrigation required at any season. Situated 10 miles from ocean. Heavy fogs. Soil and atmosphere always contain sufficient moisture. Plenty of water for domestic purposes—springs and wells. Also six miles frontage on Santa Ynez River.

Land will be sold in tracts of 20 acres or more at $50 per acre and up—one-fourth cash, balance one, two and three years at 6 per cent. Land will be deeded and certificate of title given at time of purchase.

Santa Ynez Valley Land, if properly handled, will pay for itself and bank money every year. Will also rapidly increase in value. Buy now before price jumps. Call or write for illustrated descriptive booklet.

The Ornamental Garden

GET READY FOR THE BULBS.

With the advent of our California winter or rainy season one's thoughts turn seriously and with pleasant anticipation to plants and gardening, ranging all the way from a small plot in the front yard to large acreages of field and orchard. As applied to the ornamentals, the first thing to present itself for the fall operations will be the selection and planting of bulbs for winter and spring flowers. Already the plant and seed people have issued their announcements covering this group of plants, and soon many of our readers will be in the midst of making purchases and getting ready for the operation. And right here a word of caution may not be amiss. It is none too soon to get your soil in good tilth and enriched with well rotted manure by the time the first rains set in. Wherever possible the ground can be irrigated and thoroughly spaded up. It may be said that all bulbous plants are partial to a rich loamy soil. The range of choice is almost endless, and its scope and variety should correspond to the situation and area of ground at one's disposal for the bulb garden. Many kinds are so common and prolific with us that it seems almost a waste of effort to resort to an enumeration. Nevertheless no garden should be without its clumps of callas, borders of freesias, rows of gladiolus, hyacinths, iris, amaryllis, narcissus, ixias, lillies, ranunculus, watsonias, etc. Culture and care form no obstacle to their possession, even on the home grounds of a lazy man or woman, as the essentials are merely a rich and finely comminuted soil, kept free from weeds. Usually the winter rains are sufficient to insure splendid blooms, but in case the season goes "dry," or the natural precipitation is scant, it will then be advisable to keep the soil good and moist by irrigating. While there is still plenty of time to put in a bulb garden, to those who have the itching palm for digging in the dirt and planting, it is quite safe to put in any or all of the bulbous plants herein mentioned at anytime between the latter part of September and the first of January. A few brief cultural directions are here given:

LILIUM CANDIDUM—THE ANNUNCIATION LILY.

A CALIFORNIA FIELD OF CALLAS.

The calla lily enjoys a rich soil and plenty of water; situations affording partial shade are desirable in this dry summer climate.

Freesias succeed best in light soil, and may be planted from August to November, from 2 to 3 inches deep, the flowers which appear in February and March, are white, fragrant, and useful for cut flowers.

Plant gladiolus so that the top of

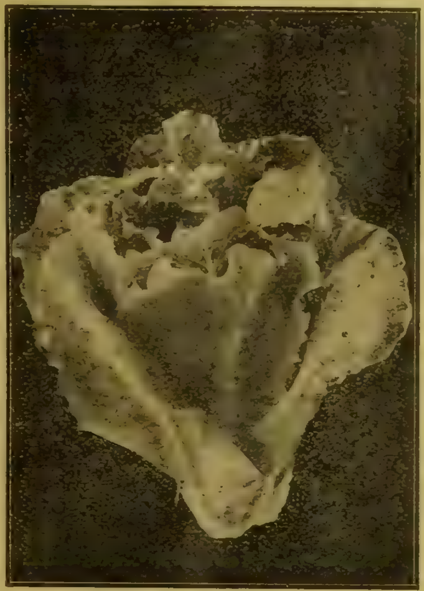
Garden and Field Crops

COS WHITE LETTUCE.

In California where irrigation water is available, lettuce can be sown nearly in every month of the year, though. like many other growths, it gives best results when planted during the moist, cool season of the early spring months. Under normal conditions the seeds readily germinate and the plant is of rapid development. The most common practice is to sow in drills, give clean culture and thin out the plant in the row to the width of from four to six inches. Again, many prefer to transplant from box or cold frame to the garden. If this is practiced, fine heads are assured by digging trenches and placing at the bottom fine horse manure, then cover with a couple of inches of garden soil, and on this place the plants, covering the same to the necessary depth with ordinary garden soil. On heavy land this system affords drainage.



WHITE COS LETTUCE.

The Cos lettuces, of which an illustration is shown, are distinguished from the cabbage varieties by the shape of their leaves, which are elongated and almost spoon-shaped. Head of mature plant long and tall, but blunt and rounded at the top; color light green; leaves somewhat folded, with the midrib light in color and prominent. It likes a rich soil and plenty of water. When given intensive culture it heads in from seven to eight weeks. Leaves crisp and tender and of fine flavor; somewhat resistant to warm weather.

DRYING VEGETABLES.

Many of the green vegetables, such as peas, string beans, sweet corn, etc., are more easily dried than canned, and more healthful, if canning powder is to be used, since the powder, by reason of its preservative qualities, renders the vegetable more or less indigestible.

Drying Green Peas.

After the peas are shelled and washed, turn into a kettle of boiling water and let boil briskly for one minute. Pour off the water and spread the peas on a drying frame in the open air or on platters to dry slowly in the dry oven. The one minute scalding is an important part of the process. If the peas are dried without scalding they will not soak out again. When wanted for use, let the peas soak over night in water and throw into a kettle of boiling water, to which has been added a fourth of a teaspoonful of baking soda. Let boil ten minutes to soften the skins, which have been rendered tough in the drying, pour off the water and finish cooking in your favorite way.

Drying String Beans.

Pick off only very tender pods and snap off the ends, breaking into inch lengths. Drop into boiling water for one minute; pour off water and spread out to dry. When wanted soak over night and if you do not like the "beany" taste, cook in soda water as directed for peas; pour off water ten minutes and finish cooking in clear water.

Drying Sweet Corn.

The sweet corn should be freshly picked to retain sweetness. After husking and silking the corn, throw into boiling water and cook one-half hour. Lift to a pan and cool, score the length of the cob with a sharp knife and press out the kernel with a downward stroke of the edge of the knife. In this way the hull of the kernel is left on the cob. When wanted for use it may be ground into meal with the aid of a food grinder and made into a thick soup, or cooked whole after soaking a while.

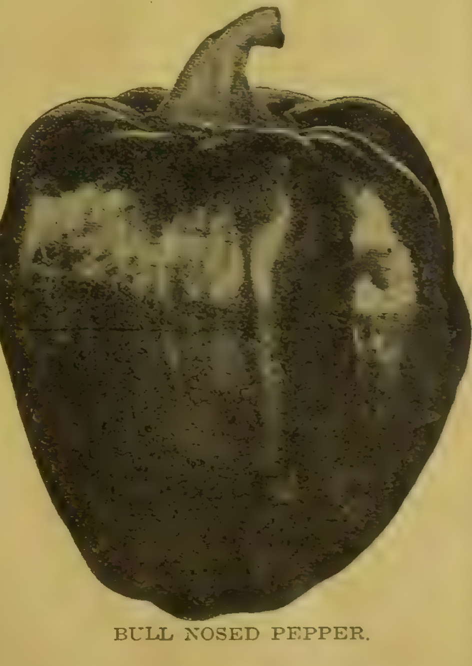
Drying Okra.

Use only young tender pods and plunge, after washing, into boiling water, to which has been added a half teaspoonful of salt to a quart kettle of water. Boil one minute and split the pods lengthwise. Dry thoroughly and when wanted for use soak over night in water.

A cheap drying frame may be made by tacking white cheesecloth on an old screen door frame, spreading over it a white mosquito bar to prevent flies from getting in. If a storm comes up it may be easily gathered up and the drying process finished in shallow cloth-lined pans in a slow oven, as, in the case of sweet corn drying, the wet corn might sour over night.—Michigan Farmer.

CAPSICUM OR RED PEPPERS.

Usually this group of plants are rated as annuals, though several species may be perennial in warm countries. All are native to South America, and possess erect branching stems which at times became more or less woody. Sow in seed boxes or cold frames; transplant when the weather is favorable to open ground in rows 18 inches apart and 10 inches apart in the row. For best results the soil should be highly manured and subjected to fine tilth before transplanting takes place. When about six inches high hoe the plants well and earth up slightly.



BULL NOSED PEPPER.

Capsicum or Red Peppers have a wide use in the realm of domestic economy, both as a condiment and for medicinal purposes. Some varieties when ground make the Cayenne, red pepper, and paprika of commerce; the pods of the large and fleshy kinds are not pungent, and for this reason can be used as a vegetable in about the same way as egg plant. Their greatest use, however, is for flavoring in cooking.

The university farm school at Davis opened Tuesday with an enrollment of 66, as compared with 42 students registered for work last year.

Canvas Goods
IN no country in the world is Canvas used to a greater extent or to better advantage than in California.
We handle the best—Living, Lemon Curing and Fumigating Tents, Irrigating Hose, Picking Sheets, Fruit Picking Bags, Stack Covers, Tarpaulins, Canvas, Khaki and Army Duck Suits, etc.

CALIFORNIA MILLS CAN SLICE 10,000 TONS OF BEETS, Cover.

WORLD'S RAISIN SUPPLY SHORT, 291.

CITRUS AND TROPICAL FRUITS.—Fumigation; Olive Crop for 1910; Olive Crop in Spain: 292, 293.

DECIDUOUS FRUIT CULTURE.—Decidedly Popular Berry; Apples Pay; Spray Injury; Walnut Crop in France; Nitrogen: 294, 295.

LIVE STOCK AND DAIRY.—Calf Diseasis; Salt River Valley; Fistulous Withers; Well Bred; Farmers' Institute: 296, 297.

ORNAMENTAL GARDENS.—Get Ready for Bulbs, 298.

GARDEN AND FIELD CROPS.—Cos White Lettuce; Drying Vegetables; Capsicum or Red Peppers, 299.

EDITORIAL.—Irrigation Congress; World's Exposition; Now for the Squirrel; Walnut Prices; Join the Exchange; Paying Tuition, 300.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast, 301.

PRACTICAL POULTRY CULTURE.—A Popular White Bird; Marketing Feathers; Linseed for Poultry; Fat Hens; Contagious Diphtheria; Fine Specimens; Poultry in Pomona Valley; Returns from Ducks; Poultry Points: 302, 303.

GENERAL AGRICULTURE. — Good Roads; Repeal Law Protecting Squirrels; English Sparrows, 305.

QUERIES AND REPLIES.—Grafting Walnuts; Splitting; Millet; Bone Meal; White Scale; Hard to Dry Off; Taming the Bull; Belgian Hare Book; Jelly from Cactus; Centrifugal Pump; Quantity of Water; Little Grapes; Poison from Sorghum: 306, 307.

HOUSEHOLD.—Raggedy Doll; Horse's Prayer; Young Wives; Nagging; Chopped Pickles; Apple Recipes; Green Peppers Stuffed; Tomatoes; Removing Mildew: 308, 309.

PRODUCE MARKETS.—Los Angeles Market, San Francisco Market; Deciduous Market, Citrus Market: 310, 311.

Irrigation Congress.

At this writing the State Rights question has not yet bobbed up in National Irrigation Congress in session in Pueblo. The friends of federal control are confident that if it does they are strong enough to overcome and hold the congress in line for maintenance of conservation and other policies, especially water distribution of the government. California delegates have concurred and resolved to stand by the Reclamation Service. The California delegation is also using every possible argument to secure an indorsement by the Congress of San Francisco as the location of the 1915 World's Fair.

In his opening address President Fowler said:

"This congress must watch over and continue to contribute to the development and growth of its foster children, national forestry and irrigation. The kindred subject of national drainage of the swamp lands of the South and the East will need its help, national waterways and the system of treatment of our rivers, especially at the headwaters, will demand and should receive our careful consideration and aid.

"Here, in this congress of the people in the national forum for the consideration of all vital questions relating to the uses and advices of water, irrigation and forestry, and so long as the governments of the people, by the people, and for the people, shall live, so long will the need of great popular convocations like this exist and appeal to the people who boast of enlightened freedom."

World's Exposition.

Although a technical error necessitates the calling of another special session of the state legislature that a correction of three words may be made in the Act permitting the vote on the five million dollar world's fair proopsition and the additional five millions for San Francisco, it may be admitted now that the proposition is squarely before the voters of the state for decision November 8. It is a state issue and not a local one. It may be admitted that in a larger sense it is a Coast or even a national question, but particularly now we wish to emphasize the fact that it is not a San Francisco fair. In fact the San Diego people, promoters of the Panama-California Exposition, are uniting heartily with others in the state to work for a big vote for the bonds. The vote will not be a unanimous one but we believe without question it will carry by a large majority.

The vast sum which will be secured for this exposition should make it one which all the world will acknowledge to be the greatest in history. For the producing class which the Cultivator represents we appeal for an especial recognition for California's greatest interest—agriculture—we mean agriculture in its larger sense. The reputation of our fruits is world wide. The stream of gold from our mines was the wonder of all, but the golden stream from soil production is greater, the attractiveness of fruit culture has brought many a settler to the state.

Then let the management of the show give early and earnest effort to encouraging the Coast to produce and to exhibit products which will truly represent its greatness. Still further, let there by gathered from all other countries every factor connected with agriculture which may be educational.

We cannot ask that the Panama-Pacific Exposition be made an agricultural fair for the arts, sciences, manufactures, mining and commerce will each demand greatest recognition and each will doubtless receive its share. But in this day of searching for that which will encourage a return to the soil, we may say that the best way to encourage such a move is simply to give justice to the calling which has to do with soil culture.

But possibly the above suggestions are premature, for New Orleans is still insistent that its claims be recognized by congress, therefore the present effort should be to show such a united front and such determination to put up a great show that congress will readily see that the interests of the nation lie only in the recognition of California's claim.

Now for the Squirrel.

Dr. Rupert Blue, vanquisher of the yellow fever mosquito in New Orleans and the bubonic plague spreading rats of San Francisco, states that the California ground squirrel is the next foe to be attacked.

"In the campaign against these disease-spreading and crop devastating rodents," he says, "Federal, State and County officials will work in supervisory and directory capacity in conjunction with land holders. The first step will be to inform the people on the habits of the squirrel and the flea by means of free public stereopticon lectures delivered by Federal and State health officers. The eradication of yellow fever in New Orleans, and of bubonic plague in San Francisco were similarly preceded by educational measures. In both instances it was demonstrated that the public can be relied upon to take intelligent and vigorous action if all the facts concerning a situation are submitted for their consideration. It is believed that putting the case clearly before the people will result in the necessary legal steps being taken by county supervisors which will insure concerted squirrel eradication measures on the part of land holders.

"The devastation of crops of all kinds by ground squirrels has always been a serious handicap in the development of agriculture in this state, and it is believed that farmers will promptly popularize a movement that will relieve them from an economic scourge of long standing and at the same time protect their families from the dangers of disease."

Walnut Prices.

The Walnut Growers Association of Southern California held a meeting at Los Angeles last Monday and recommended the following prices for the coming year:—No. 1 soft shells, 15 cents; No. 1 hard shells, 14½; No. 2's of both kinds, 11. Budded or grafted nuts not less than 2½ cents above these quotations provided graded over standard screen. Some of the growers favored lowering the price a cent or more from these quotations, but as outside growers have already sold at 15 it was deemed wise to hold fully up to that figure.

Such a figure probably would never have been offered had not co-operation on the part of such a large proportion of the growers tended to steady the market. Walnut producers are to be congratulated.

Join the Exchange.

Referring to an advertisement in a Los Angeles paper in which a fruit packer offered for sale his packing house and announced his retirement and entrance into the real estate business, the Florida Packer says:

"This you will recall, is a part of the combination that fought the California Fruit Exchange so strenuously for so many years. They had unlimited capital back of them and private cars galore. In course of time the citrus fruit growers of the Pacific slope came to realize that they could handle their shipments themselves to better advantage through the Exchange and so that company gracefully stepped aside. Florida growers should heed this lesson and get into the Exchange. The sooner they do so the sooner will the Exchange attain to the full measure of its usefulness in serving them."

Paying Tuition.

We once heard genial I. P. Roberts, formerly at the head of the Agricultural College at Cornell, remark that he would be in possession of almost untold wealth if he had not paid so much for his tuition. His tuition had been paid in the school of experience and had cost him so dearly that he must consider himself still a comparatively poor man. Practically the whole human race is doing the same thing, paying for lack of experience, and often for lack of perception of the lessons of experience; they have not secured the advantages they should from their "schooling." Our educational institutions are today offering better opportunities for the young man who would start right in agriculture than they did years ago. He will enter his calling better fitted than the farmer of a few decades ago, but no matter how good the schooling, experience will still prove the best teacher, and he should have his eyes open to her lessons.

The month of August was favorable for all crops the country over, and the deterioration amounted to only .6 per cent, whereas the average decline for that month is 3.3 per cent. The average crop conditions on September 1st, practically at harvest time, were only about .4 per cent lower than on the corresponding date of a year ago or 2.8 per cent lower than the average for the past ten years. The area under cultivation is about 3.2 per cent greater than last year.

All plans for the program of the dry farming congress to be held in Spokane the week of October 3rd, and for the exposition in connection, are completed and a great event is parts of the West, and even from all parts of the West ,and even from all parts of the world, will be there to discuss all questions touching upon methods which will advance the wealth of arid America.

The coming week will be one full of opportunity for those who can attend the short course in agriculture at the University farm at Davis. There will be lectures on keeping farm accounts, culture of alfalfa, formation of soils, fertilizer, improving of wheat, sugar beets, and many other topics by an excellent corps of instructors.

The Orange County Dried Fruit Association is now holding its remaining apricots at 11 and 12 cents. Seven to eight cents were their highest offers early in the season. A little co-operation aided in preventing many growers from selling at those early figures.

"No two winters alike and no two summers different" in California received a jolt from the freak rain, the damage from which is not yet fully estimated. As a rule, however, even the raisin men report damage not as great as first anticipated.

The twenty-fourth premium list of the Oregon Fruit Show is issued and gives a long list of prizes and premiums which will be awarded. The Show will be held in Portland, Oregon, Nov. 30 and Dec. 1. and 2.

Fight the pests. From all parts of the state come reports of renewed attack on all pests from Johnson grass or Russian thistle to squirrels. These pests cost too much. We cannot afford to harbor them.

The average condition of corn on September 1st was 78.2 as compared with 79.3 last month and 79.5 ten years' average.

The National Good Roads Convention will be held at Oklahoma City next week, October 4-6.

Agricultural News Notes of the Pacific Coast

Northern California

Arthur Dunlop, of Diamond City, is experimenting with pears by drying them in the sun. He has given the fruit a treatment of sulphur to bleach it and is drying five tons.

Prof. W. A. Setchell of the botany department of the University of California has nearly two hundred varieties of tobaccos planted in an experimental bed on the University campus.

William Grant, manager of Balfour-Guthrie Company's ranch near Biggs, Butte county, and G. B. Mann, soil expert, report that only 49 of the 200 varieties of rice planted have proved available.

Upward of two hundred acres of the Meek orchard property south of Haywards in Alameda county has been divided up into acreage tracts. This land is admirably adapted to fruit and poultry ranches.

Bartlett pear orchards in Sacramento and vicinity are again threatened with the malignant pear blight, which found its way into the Sacramento Valley and has so far been held fairly well in check by vigorous methods.

Two cars of first-class soft shell almonds were shipped last week from Orland to San Francisco. This is probably the largest lot of almonds ever shipped from Orland at one time and shows the value of the crop in that section.

Shipping of wine grapes from the Yuba district in Sutter county has commenced and from all reports the crop is good. Several of the large growers have contracts with the California Winery in Sacramento at about $11 per ton. Others sold this year at about $7 to $8 per ton.

Great flocks of geese are arriving on Butte Creek from their stays in the Northern wilds three weeks earlier than is their wont. Usually they do not arrive until a week or so past the first of October. That they are coming into California at this time means early rains.

The warehouse of the Sutter Almond Growers' Association is now under way and will be equipped with bleachers, scales, etc., for the handling of the almond crop. Growers will deliver the almonds at the warehouse when completed and the nuts will be bleached under the direction of the California Almond Growers' Exchange.

Within the past two years the Sebastopol Berry Growers' Incorporated, has developed into one of the strongest organizations in Sonoma county which has already done wonders in developing the berry growing industry and protecting the interests of the growers, as witness its shipments: 183 tons Loganberries, 57 tons blackberries, 18 tons raspberries, and 183 tons Lawton blackberries.

An effort is being made to introduce pheasant in the Pajaro valley. To that end Geo. P. Martin and H. C. Peckham recently received a consignment of Mongolians from the state farm at Haywards, of which Charles Voglesang is manager. The birds were sent to the Kelly-Thompson ranch where they will run the hills on that and neighboring ranches until their growth warrants good hunting.

The pear industry is an important one to Sacramento. Between 1500 and 2000 cars of Bartletts are shipped from that city to eastern markets every year. These sell for top prices and bring thousands of dollars into that city. On some days during the season as many as fifty cars of this fruit are forwarded. The sales east do not represent the total value of the crop. Hundreds of tons of pears are sold to local canneries every year.

Central California

San Jose's second annual pure food show opened Saturday evening, September 17. It is said that the interior of the Auditorium building was made far more attractive this year.

The death of hundreds of water fowl and game birds of all descriptions on the Boggs tract west of Stockton is causing the health authorities and game wardens much concern. The disease is somewhat like the roup which attacks chickens.

A careful estimate of this year's crop of raisins in Kings county gives an increase over 1909 of about 2000 tons, making the incoming crop 10,000 tons. Of this amount scarcely one-half has been contracted for, although $70 per ton has been reached.

One of the important creamery deals of the year in California was made recently when the business of the Ceres Creamery Association in Stanislaus county passed into the hands of Scheer, Grandi & Co., a leading produce firm in San Francisco.

Fame of the wheat raised on the Tagus ranch, one of the largest single wheat ranches in Central California, is reaching wide. An order has been received for twenty sacks from a wheat rancher of Walla Walla, Wash. On 530 acres last season the reported yield amounted to 11,000 sacks.

R. F. Guerin, prominent dairyman and breeder, with a ranch near Goshen, has received notice that his champion cow, Apple Blossom Sample, which took first premium at the Tulare county fair at Tulare a year ago, has been given a place on the grand register, in the Holstein herd book of the National association.

A Cultivator representative recently met D. R. Shaffer at Denair, Stanislaus county, the founder of the town of Orosi, Tulare county. In conversation he explained how he happened to coin the word Orosi: Oro in Spanish is gold; si, in Spanish means yes. Gold, yes—if you cultivate the land.

The Visalia Delta is responsible for the statement that by the first of the year Tulare county will probably be able to boast of the possession of the model dairy of the country. It is planned to erect it on the Tagus ranch, nine miles southwest of Visalia, which consists of 2800 acres of fertile land on Packwood creek.

The Fresno county fair, October 3 to 8 inclusive, will be the biggest thing of the kind ever pulled off in the San Joaquin valley. The directors of this year's fair have mapped out a program of special events that is bound to attract. Among the features may be mentioned: Governor's day, Union Labor day, Fraternal Order day, Queen's day, Fireworks display, Carnival day.

Judging from general indications the market for orange trees in the San Joaquin valley will rule high, as the available supplies are somewhat limited. According to the Porterville Enterprise, at the present time the ruling quotations on trees are about as follows: Orange trees, ⅝ to ¾ inch in diameter in 100 lots or over, $1.10; ½ to ⅝ inch in diameter in 100 lots or over, $1.00; ⅜ to ½ inch in diameter in 100 lots or over, 90c.

The different locality days for the apple show at Watsonville (Oct. 10-15) have been allotted as follows: Monday, "Governor's Day," when Governor J. N. Gillette will be present and address the apple men. Tuesday, "Schools' Day." Wednesday, "Panama-Pacific and All California Day." Thursday, "Home Coming and Sight Seeing Day." Friday, "Santa Cruz, Monterey and adjoining Counties Day," Saturday, "Automobile Day." The date for closing the entries of exhibits was extended from Sept. 26 to Sept. 27.

Southern California

Wild ducks are so plentiful in the El Centro district that they are a nuisance to ranchers. An effort will be made to change the game laws to permit shooting them after the 1st of September.

The Escondido Times says that Charles Dixon, living at the upper end of the valley, is the proud owner of a single plant that produced fourteen pounds of rhubarb. In the language of the street, "that's going some."

With the completion of the contract for the icing of Santa Fe fruit cars, Will H. Godfrey will on October 1 assume charge of the Gate City Ice and Pre-Cooling company's plant, where the fruit cars are to be refrigerated entirely in the future.

E. C. Richmond of Goldfield has bought the George H. Lawrence ranch at San Luis Rey, paying $4200. The place comprises 40 acres with water rights. He will engage in the dairy business and proposes to plant fifteen acres to alfalfa at once.

At a directors' meeting of the Richland (Orange county) Walnut Association held recently, Wm. Wagner was elected secretary for the coming year. H. L. Helwig was appointed house manager. The crop estimate is placed by President Hargrave at about 20 to 25 per cent less than last year.

J. W. Gregg and C. R. John recently bought the Copelin ranch in the San Jacinto mountains and will add to the apple acreage of the place during the year. The apple-producing area of Southern California is limited and as the cities are growing a profitable market is reasonably assured.

The plant of the California Silk Mills at San Diego is closed during the absence of W. H. Hibbard. It is reported that he is East on business and that he may not return. There is a small amount of silk in the looms but the place gives an appearance of having degenerated into a state of innocuous desuetude.

According to the Fullerton Tribune, J. E. Stockwell is successfully growing several varieties of tobacco on his place near that town. Experts who looked over the crop a few days ago declare it looks as well as any ever grown back in the Southern states. Stockwell has been offered a good price for his entire crop.

Several of the apricot growers in the Big Simi valley, Ventura county, have together purchased a large power spraying outfit. They intend to spray their orchards for the black scale, which has been worse than usual the past year. After spraying their own orchards they intend to rent the outfit to other growers.

For $23,000, J. P. Gilmore has sold two orange groves, one in Riverside and the other at West Riverside. The purchaser was Mrs. J. H. Bakeman of Los Angeles. The Riverside grove consisting of ten acres, sold for $14,000. The West Riverside ranch comprises 17½ acres, is located opposite the school house ad a mile and a half from Riverside. The consideration was $9000. Only a portion of the property is planted to oranges, the remainder being grain land.

John A. Dent, of Ventura, is trying to organize the apricot growers. In a late letter written Mr. Dent says: "As far as I can learn, there were 4100 tons of dried apricots last year, and 1500 tons this year. There are about 400 tons unsold which are being held at 12 cents. One of my neighbors sold September 7 for 11 cents. I think we will get the 12 cents. The names already signed for an association represent 350 acres of apricots, and I have not had time to get over more than one-fourth of the county."

The Coast

The dates for Oregon's big apple show are November 30 and December 8. It is said that the show will be the largest affair of the kind ever held in the Northwest.

All merchantable timber in the burned areas in the national forests of Washington and Oregon will be sold immediately. Plans for its sale have been completed by the forestry service.

Oregon lands aggregating 1,873,280 acres were thrown open to settlement September 15 under the provisions of the enlarged homestead act by authority of Acting Secretary Pierce of the interior department.

One of the largest sales in recent weeks, in the Lewiston (Idaho) orchard tracts was made September 15. W. T. Mullarky selling 10 acres of 3-year-old orchard to John W. Haben of Duluth, Minn., for $856 an acre.

Four thousand five hundred boxes of pears is this season's production on the famous J. G. Gore orchard on the Ashland road, Medford, Oregon, This made a shipment of 11 cars. Last year Mr. Gore shipped 12 cars from the same land.

Pacific Coast apples have the occident and the orient for a market. Recently Messrs. Richey & Gilbert, of North Yakima, Washington, secured two orders for 100 cars of apples each. One of the shipments went to Australia and the other to New York.

With an estimated crop of 60,000 tons of hay for market in the Kittitas Valley, Washington, and fully 100,000 in the Yakima Valley and with timothy selling at $19 to $21 on board cars and alfalfa at $11 to $13, the hay farmers of the Inland Empire are feeling pretty well satisfied, thank you.

During eight months ending with August, as shown by Department of Commerce figures, Puget Sound exported more wheat than any other customs district in the United States, 1,945,088 bushels, all told. In that same time Portland exported 1,396,917 bushels, ranking fourth among wheat exporting districts.

The government scored an important victory in the United States District Court for Oregon when decisions were handed down setting aside patents on thirty-seven claims to timber lands aggregating 6000 acres, valued at more than $500,000, which were held by the C. A. Smith Lumber Company of Minneapolis.

With a view to procuring information on Mexican agriculture to be sent to the International Institute of Agriculture in Rome, the department recently asked the governors of the several Mexican states a series of questions. For definite replies these have in turn been sent to all subordinate officers in the service.

The survey of the Zamboanga Townsite (Philippine Islands) and the agricultural lands adjacent thereto has been progressing under the direction of the Bureau of Lands since January, 1908. There is included in this area 10,050 hectares and its limits extend from the western boundary of San Ramon Farm to the barrio of Catumbal north of Mercedes.

An agricultural school for pagan children is being established in the district of Davao, Island of Mindanao, Philippine Islands. C. R. Cameron, provincial superintendent of schools, has been working on the plan for some time. The purpose of the school will be to teach its pupils practical agriculture as it is carried on in the Gulf of Davao, together with English, reading, writing and arithmetic, also the incidental trades such as carpentry, blacksmithing, etc., which experience has proved to be necessary for the successful operation of a plantation.

Mammoth Hatchery

We are the great poultry Emporium in the West. We sell only the very best, at prices that will bring your orders right along.

1500 to 2000 Splendid Pullets and Laying Hens

in our yards and orchards every day. Finest and largest poultry sales yards in Los Angeles. Lately sold over 20,000 birds. We have on hand daily from twenty to thirty different breeds. Ask about P. Cook's Extra Select White Leghorns, the finest, largest, most prolific layers in the world. Only $15.00 per dozen. This week also the best flock of White Minorcas in California for sale. Only $3.00 each for hens. Guaranteed to win in almost any show. We are the largest shippers, both wholesale and retail, of fine poultry. Good White Leghorns this week at $9.00 per dozen. All other breeds in proportion. Write for catalog. Buy where you can get birds that can be depended upon.

P. Cook, 3017 S. Main St., Los Angeles, Cal.

If you want your hens to lay more of those high-priced eggs, feed

West Coast Egg Food

Nothing better made for the purpose, and the price is now only $1.80 for 75-lb. sack, or $45.00 for a ton. If not sold by your dealer, sent to us. Or, if you are distant from Los Angeles, and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

Office and Salerooms, 115 Winston St.
Los Angeles, California

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Practical Poultry Culture

A POPULAR WHITE BIRD.

In California breeders seem to have a liking for a white bird. As an evidence of this we have only to cite the predominance of the White Leghorn over all the parti-colored varieties; the preference in many cases of the White Wyandotte over the dark plumaged sorts; and the popularity of the White Plymouth Rock over the other varieties, with possibly the exception of the Barred, which seems to hold its own against all rivals. From a fancy point of view type, color of feather is invariably a matter of individual taste; but when it comes to economic considerations, the bird giving the best returns in hen fruit and carcass usually stands supreme. In type and other points excepting color of plumage, the White Rocks in no way differs from the other varieties of the breed. It was first introduced by a Mr. Frost in Maine as early as 1880. The "make-up" of the different blood that went into its creation is a subject that does not particularly interest the practical man; suffice it to say that the variety has became sufficiently "fixed" to breed reasonably true to type and color of plumage. In its earlier stages matings often showed white and black chicks and also mixed colors, which would indicate that its inception was from sports of the Barred variety. Even at this late day there is a tendency of mealiness and black appearing in plumage.

In habit the White Rocks are much more docile than the Leghorns, and hence stand confinement reasonably well. Unless given healthy exercise, they are apt to become overfat which is not desirable in good laying hens, and besides it tends to aggravate liver troubles. As layers the females rank well, particularly so if from a good laying strain. The carcass has everything to commend it for table purposes. Indeed, as an all purpose fowl they are as good as the best.

STANDARD WHITE ROCK HEN.

SECRET OF MARKETING FEATHERS.

Miss Frances E. Wheeler, one of the most successful breeders of land and water-fowl, gives these points on successfully marketing feathers:

In almost every large city there are wholesale feather dealers and establishments where feathers are made up into fancy millinery adornments and trimmings, such as boas, etc., and where can be found a market for the entire output.

Turkey feathers, especially the white ones, find a ready sale and at good prices. Each kind should be kept separate, clean, and laid smoothly in a box all the ends pointing the same way. The different kinds of feathers are known as the fluff, the skirt, the body, the long and short tail, and the three sorts of wing feathers.

Of Pekin duck feathers there are the first joint of the wing to be cut off, and the coarse feathers plucked. The fine feathers and the down may be plucked together.

The long tail and fine saddle feathers of roosters find ready sale at fancy prices.

I pack all my feathers smooth and tight in a paper box if to be sent by express, or in a light wooden box if to go by freight.

After plucking, the feathers should be spread on a clean floor and shaken up and turned over two or three times a week. They cure in about six weeks. Should there be a bad odor to the feathers, the case containing them should be laid on a clean grass-plot for a few nights, the feathers shaken up occasionally, and the earth will draw out every particle of odor and leave just the sweetest, cleanest smell imaginable.—Poultry Secrets.

Wheat is a better food for egg production than corn. The latter is heating, fat producing, and is excellent in cold weather, especially at night.

LINSEED MEAL FOR POULTRY.

Linseed meal is highly nitrogenous and is invaluable as a food for poultry. It is much superior to cotton-seed meal, as the seeds from which it is made are fully matured. This addition to the regular food may be given the fowls at all seasons of the year, but it is especially good for them during the cold months of winter. It is not so heating that it will prohibit the hens from laying, but will aid them in that function, as well as assisting their bodies to remain in good condition during the cold weather. Linseed meal is richer in the elements of growth than many other foods, and even when the hens are allowed a plentiful supply of grain, it is well to allow them a certain percentage of the meal. To every quart of ground grain used add about a gill of linseed meal. While it aids the fowls in their work it also greatly enriches the manure, thus making another product of the fowls much more valuable. It is rich in mineral and nitrogenous matters and serves to make a balanced ration. Do not give the linseed meal oftener than once a day during the winter, and about half as often during the warm weather.

There are many varieties of foods which must be purchased in mixed condition and the poultryman does not know exactly what they contain, but when he selects his own food and balances it well with linseed he will find that the fowls derive as much, if not more, benefit from it as from the more expensive materials. A greater portion of the chick and hen foods which come already prepared have a certain percentage of the linseed meal in them, and that is the secret of their success. It is not true in all cases, but it is added to nearly all the prepared foods. Give the hens a good supply of egg-producing materials, to which has been added the linseed meal, and see if they do not prosper. It will at least be found beneficial to a certain extent.—Mirror and Farmer.

FAT HENS IN THE POULTRY YARD.

When asked at the Ontario poultry institute whether or not a hen was apt to get too fat to lay, James E. Rice, the well known poultry authority at Cornell, N. Y., stated that he could not answer the question satisfactorily. He related the following experience:

Once we killed all the hens in one of our experiments, and we found that the fattest hens were the hens that were in the best laying condition, and since that time we have been making very careful observations along that point. A hen to be in a good laying condition must have fat in her body. The production of eggs is based upon the fact that the hen has lots of stored up energy in her condition; and a hen cannot lay an egg until she has got fat in her body, because the yolk in an egg is about half fat, and she has got to have oil there to make the first part of the egg.

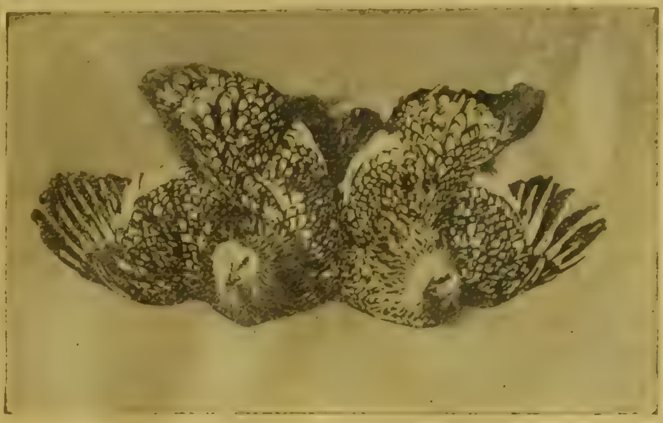
The three fattest hens we killed were in the best laying condition, and the three poorest hens we turned out by themselves, and there was not the faintest chance of them laying for two or three months. They were not poor hens in the sense of being thin. They simply did not have a large amount of fat in their bodies. How are we to feed a flock of hens? We cannot feed the individuals according to their immediate needs. The dairyman is in a different position, as he can feed each cow all she requires.

CONTAGIOUS FOWL DIPHTHERIA.

Recent experiments made by G. Schmid, particulars of which are given in a German goverment bulletin, seem to establish it as contagious. The results are given of an investigation with 60 cockerels and 83 hens from which the author concludes that it is possible to produce typical pock lesions in chickens having diphtheria, and further, that bird pox is not a separate disease but a part of the diphtheria and has the same etiology. Fowl diphtheria occurs in 3 forms: That affecting the mucous membrane, that affecting the skin, and a combination of the two.

TWO FINE SPECIMENS.

Among the tribe of Wyandotte fowl the Silver Laced were among the first to attract public attention. Indeed, in the eighties this variety was easily in the lead in the American class, especially in the Middle West. A few years later it also became popular on this coast—a popularity which of late years has been somewhat on the wane. The distinctive feature of the Silvers is that the feathers of the hen are white with narrow edging or lacing of deep black around the edge. The breast of cock is of the same color, while other parts of the body are a silvery white, the neck and saddle feathers having a black stripe through the center, while the tail is a greenish black. The two pullets we show herewith were bred a few years ago by a Mr. Hohenshell, who at that time had a poultry plant in San Diego county, but has since moved north. At one time his stock was recognized as among the best bred in this state.



FINELY MARKED S. L. WYANDOTTE PULLETS.

POULTRY IN THE POMONA VALLEY.

Recently it was the pleasure of the writer to spend a few days in Pomona, on which occasion he was surprised and gratified to learn of the healthy growth that the poultry industry has attained in that valley. Many of the fruit growers have learned the value of a flock of thoroughbred fowl as adjuncts to their main business; that hen fruit has a value quite as staple as the orange or the apricot. For the most part the Mediterranean and American classes predominate, Leghorns being favorites of the former and Wyandottes and Plymouth Rocks of the latter. The colony plan in caretaking is quite common, the houses being located directly in the orchards. Numbers under single ownership vary somewhat; there are a few people who have from five hundred to a thousand head, but the farm flocks will average about one hundred and fifty head each. A good market is assured by reason of close proximity to Los Angeles. When the local demand is light shipments are made direct to Arizona, chiefly to the mining settlements. The industry has advanced sufficiently to be beyond the experimental stage, and we look for a healthy development and expansion during the next few years.

POULTRY IN THE POMONA VALLEY.

GOOD RETURNS FROM DUCKS.

A flock of ducks increases my profit on the farm every year. The eggs are sold at good prices in the spring for setting, and there is always a good sale for the feathers. I raise the large full-blooded Pekins, which sometimes weigh more than seven pounds when sold in the fall. They are much less trouble than chickens or turkeys, because they seldom die from disease.

Ducks will almost take care of themselves after they have been hatched a short time. Set the eggs in May, and as soon as the ducklings are large enough to eat, sprinkle thick curd in their boxes. Shallow vessels should be used for watering. When the ducklings get a little older, feed potato peelings mixed with corn-meal and scraps from the table. They will do much better when the feed is changed often. As they grow older feed some grain, such as rye, wheat and corn. When all the grain fed is raised on the farm, the cost of keeping ducks is quite small. I have turned my ducks into a potato patch with bugs on the vines, and they entirely rid the vines of the bugs in a very short time.—Farm Journal.

POULTRY POINTS.

Fowls need more food in wet weather than in dry, in cold than in hot, and in wet and cold weather combined more still is required. Give plenty, but not too much. When food is left lying about it gets dirty, and entices sparrows, mice and other vermin.

A clean, dry house is the mainstay to success. Dry up and get busy with the whitewash brush.—Poultry Record.

A Healthy Chicken is an asset, a sick Chicken is a liability: because it is apt to give disease to others, it's therefore a loss not a gain.

To keep your poultry healthy—to make every hen an asset, regularly use in the feed twice a week,

Coulson's

No. 3 Condition Powders

Give it to well chickens to KEEP them well, give it to sick chickens to MAKE them well.

Helps chickens to digest and assimilate all their food, makes hens lay right up to molting and starts them laying quick after the molting season.

Farmers' Week

We have from Prof. Leroy Anderson, superintendent of Farm Schools, the program for the coming farmers week at the University Farm at Davis, as follows:

October 10.—Introductory Lecture, E. J. Wickton____Principles of Pruning and Treatment of Young Vines, F. T. Bioletti____Horticulture at the University Farm, W. T. Clarke____Demonstration in Judging Dairy Cattle, J. S. Thompson____Invocation, Rev. T. J. Barkle, Davis____Address of Welcome, E. J. Wickson____Observations on My Summer Outing, Judge Peter J. Shields, Sacramento.

Tuesday, October 11.—Butter Fat Losses on the Farm, H. A. Hopper____Forage Crops. (Second lecture.), E. J. Wickson____Judging the Quality of Land, I. P. Roberts, Palo Alta____The Physical Condiiton of Soils, Professor F. H. King, Madison, Wisconsin____Essential of Success in Grain Culture, G. W. Shaw____The Needs of the Modern Creamery, H. A. Hopper____(Presentation of the prize calf in competition between University Farm Creamery patrons.)____Choice and Preparation of Land for the Orchard, W. T. Clarke____Dry Land Farming with Relation to California, G. W. Shaw____Demonstration in Judging Beef Cattle, E. W. Major____University Farm Students' Association Annual Meeting and Election of Officers, W. O. Russell____Illustrated Lecture on Soil Studies, F. H. King.

Wednesday, October 12.—The Importance and Methods of Making Butter Fat Tests on the Farm, H. A. Hopper____Forage Crops. (Third lecture.), E. J. Wickson____Improving the Land, I. P. Roberts____Control of Infectious Diseases in California, Dr. Chas. Keane, State Veterinarian____The Young Tree and Its Care, W. T. Clarke____Results of Animal Disease Investigations by University of California, C. M. Haring____Essentials of Success in Grain Culture, G. W. Shaw____What is Soil Fertility? C. B. Lipman____Demonstration in Judging of Draft Horses, Howard Phillips____Autopsy of Tubercular Animal, Dr. Geo. W. Baker____(Chief Inspector, Bureau of Animal Industry, San Francisco)____Meat and Milk Inspection, (Illustrated to stereopticon), Dr. Geo. W. Baker.

Thursday, October 13.—The Milk Production Problem, H. A. Hopper____Forage Corps, (Fourth lecture), E. J. Wickson____Country Life Conference, W. A. Beard, Sacramento, Chairman____Social and Educational Organizations of Farmers, E. T. Pettit, Master State Grange, Discussion led by B. F. Walton, Yuba City____The Country Church, Arthur Hicks, Field Sec. Presbyterian Church. Discussion led by Mrs. E. C. Laugenor, Woodland, and Professor Roberts, Palo Alto____The Country Problem as It Presents Itself to the Farmers's Wife, Mrs. F. T. Gage, Elk Grove____Discussion led by Mrs. G. W. Pierce, Davis, and Mrs. Emily Hoppin, Yolo____Address, President Wheeler. Rural Schools, Jas. A. Barr, Superintendent of Schools, Stockton. Discussion led by Edward Hyatt, State Superintendent Public Instruction; Miss Lillie L. Laugenor, Superintendent of Schools, Colusa county, and LeRoy B. Smith, Director California Polytechnic School, San Luis Obispo____Health and Sanitation in the Farm, Dr. W. F. Snow, Secretary State Board of Health____Co-operative Marketing, J. W. Jeffrey, State Commissioner Horticulture. Discussion led by J. P. Dargitz, Acampo____Farm Labor, W. A. Vann, Colusa, Discussion led by Geo. D. Kellogg, and G. H. Hecke, Woodland____Address: Industrial Education, W. A. Beard, Sacramento.

Friday, Otcober 14.—Defects in California Butter, H. A. Hopper____Forage Crops, (Fifth lecture), E. J. Wickson____Orchard Protection, W. T. Clarke____Insects of the Young Orchard, I. C. Bridwell____Immigration Affecting Agriculture, Professor I. P. Roberts____Various Systems of Summer Pruning, F. T. Bioletti____Administration of the Pure Food Law, M. E. Jaffa____Use of Concrete in Irrigation Structures, B. A. Etcheverry____Results of Duty of Water Experiments at Davis, Frank Adams____Demonstration in Judging Sheep, Howard Phillips____Concert by the University of California Glee Club, (C. R. Morse, director), Pavilion.

Saturday, October 15.—Care of Utensils and the Handling of Cream on the Farm, H. A. Hopper____The Control of Garden Insects, C. W. Woodworth____Grafting of Vines, F. T. Bioletti____The Application of Insecticides, C. W. Woodworth____Demonstration in Judging Swine, Howard Phillips____Meeting in charge of Sacramento Valley Development Association, (Marshall Diggs, President; O. K. Miller, Secretary), Pavilion, Subject: Good Roads.

Home Economics for Farmers' Week.

The lectures on Home Economics and demonstrations in cooking are given by Miss Clara Palmer, Instructor in Domestic Science at the California Polytechnic School, San Luis Obispo, and recently from Teachers College, New York. This work will be given in the Dairy Building, Rooms 9 and 10.

Monday, October 10.—Lecture and Demonstration in Cooking, Miss Palmer.

Tuesday, October 11.—Lecture: Home Economics, Miss Palmer____Insects Injurious to Health, W. B. Herms____Lecture and Demonstration in Cooking, Miss Palmer.

Wednesday, October 12.—Composition of Foods, M. E. Jaffa____Suggestions for Home Grounds, R. E. Mansell____Education of Farmers' Daughters, LeRoy B. Smith, Director California Polytechnic School____Demonstration in Cooking, Miss Palmer.

Thursday, October 13.—Household Sanitation, Dr. W. F. Snow, Sacramento____Remainder of Day, Country Life Conference.

Thursday, October 14.—Use and Value of Skim Milk, M. E. Jaffa____Sanitary Construction of the Home, C. G. Hyde____Administration of the Pure Food Law, M. E. Jaffa____Demonstration in Cooking, Miss Palmer.

Saturday, Otcober 15.—Lecture and Demonstration in Cooking, Miss Palmer.

Secretary O. H. Miller of the Sacramento Valley Development Association has secured from the State fair the exhibits of Tehama, Glenn, Colusa and Butte counties, to be placed on exhibition at the United States Land and Irrigation Congress at Chicago, and later to be transferred to a building at the corner of Washington and Dearborn streets, Chicago, where they will be shown under the management of the Sacramento Valley Irrigation Company.

Mr. John Sollie, of Minnesota, has become assistant manager of the Central Creamery in Humboldt county. He resigned employment in the U. S. Experiment Station at Albert Lea, Minn., to look after practical operations in the Central creamery when Mr. A. Jensen came to San Francisco to establish an office here for the development of plants throughout the State. Mr. Sollie engaged in the creamery business in 1891 in Norway. He came to this country in 1900.

Veterinary

Heart and Skin Trouble.

I have a mare apparently sound in every way, but I can occasionally hear her heart beat very distinctly. In fact one day I thought it was some one pounding on the barn with a rubber hose. She is strong and fat and does not get out of breath in traveling fast or going up hill. It does not seem to distress her. Does not occur often and only once has it been so loud as I have described.

I also have a mare that has a roughness of the skin of the breast and shoulders. Sometimes the hair comes off the top of these little elevations leaving small scars. She also has some places on her legs that look as though they might perhaps have been old kicks. Is she scrofulous?

The thumping you have noticed is due, I think, to a contraction or jerking of the diaphram and that the heart is in no way affected. It comes from some reflex nervous irritation that will take a closer inspection than I can make at this distance.

For the skin trouble clean off the scabs and wash with a solution of two ounces of Formaldehyde in one gallon of water. Give internally twice daily a tablespoonful of magnesia sulphate. This can be mixed with ground feed.—R. T. W.

Actinomycosis.

My bunch of cows have lumps on both sides of head near ears, also lumps near throat. Have cut some open and find but little matter.—A. T. H., Turlock.

The cows have probably got Actineomycosis or lumpy jaw as it used to be called, produced by the Ray fungii which finds its way into the lymphatic glands and sometimes into the jaw bones themselves. The treatment is one-half ounce of Potassium iodide daily. Have one pound of potassium iodide dissolved in one quart of water and give two drams of this solution twice daily.

It may be given in the feed or poured down the throat. If the lumps have not diminished in size at the end of a month get one-half the amount and continue the treatment, this is almost a specific.

Colts Cough.

My colt has cough and runs at nose. Is especially troublesome at night.—Subscriber, Bakersfield.

Have the following made up and give one-half ounce three to five times daily. It can be injected into the throat with a long nozzle metal dose syringe: Cottonseed oil, eight parts; kerosene, one part; Eucamphol, one part.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as. "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar Sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY,
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

Charges for Soil Work

(Temporary)	PER SAMPLE
Mechanical Analysis (five grades of fineness)	$1.00
Lime and Magnesia Determinations (available)	1.00
All the above with Phosphoric Acid, Chlorine, Alkalinity, and approximate Humus	3.00
Potash	1.00

SAMPLES—Take surface sample from first foot: subsoil from between 2½ and 3½ feet depth; deep subsoil from between 7 and 8 feet depth. One pound is enough for a sample if well mixed before divided down. PRICES—These prices are in force [illegible] while advertised.

GOOD ROADS.

Good roads mean progress and prosperity, a benefit to the people who live in the cities, an advantage to the people who live in the country, and it will help every section of our vast domain. Good roads, like good streets, make habitation along them most desirable; they enhance the value of farm lands, facilitate transportation, and add untold wealth to the producers and consumers of the country; they are the milestones marking the advance of civilization; they economize time, give labor a lift, and make millions in money; they save wear and tear and worry and waste; they beautify the country—bring it in touch with the city; they aid the social and the religious and the educational and the industrial progress of the people; they make better homes and happier hearthsides; they are the avenues of trade, the highways of commerce, the mail routes of information, and the agencies of speedy communication; they mean the economical transportation of marketable products—the maximum burden at the minimum cost; they are the ligaments that bind the country together in thrift and industry and intelligence and patriotism; they promote social intercourse, prevent intellectual stagnation, and increase the happiness and the prosperity of our producing masses; they contribute to the glory of the country, give employment to our idle workmen, distribute the necessaries of life—the products of the fields and the forests and the factories—encourage energy and husbandry, inculcate love for our scenic wonders, and make mankind better and broader and greater and grander.

The plain people of the land are familiar with the truths of history. They know the past. They realize that often the difference between good roads and bad roads is the difference between profit and loss. Good roads have a money value far beyond our ordinary conception. Bad roads constitute our greatest drawback to internal development and material progress. Good roads mean prosperous farmers; bad roads mean abandoned farms, sparsely settled country districts, and congested populated cities, where the poor are destined to become poorer. Good roads mean more cultivated farms and cheaper food products for the toilers in the towns; bad roads mean poor transportation, lack of communication, high prices for the necessaries of life, the loss of untold millions of wealth, and idle workmen seeking employment. Good roads will help those who cultivate the soil and feed the multitude, and whatever aids the producers and the farmers of our country will increase our wealth and our greatness and benefit all the people. We can not destroy our farms without final decay. They are today the heart of our national life and the chief source of our material greatness. Tear down every edifice in our cities and labor will rebuild them, but abandon the farms and our cities will disappear forever.

When the agricultural production alone of the United States for the past eleven years totals $70,000,000,000, a sum to stagger the imagination, and it cost more to take this product from the farm to the railway station than from such station to the American and European markets, and when the saving in cost of moving this product of agriculture over good highways instead of bad would have built a million miles of good roads, the incalculable waste of bad roads in this country is shown to be of such enormous proportions as to demand immediate reformation and the wisest and best statesmanship; but great as is the loss to transportation, mercantile, industrial, and farming interests, incomparably greater is the material loss to the women and children and the social life, a matter as important as civilization itself. The truth of the declaration of Charles Sumner fifty years ago, that "the two greatest forces for the advancement of civilization are the schoolmaster and good roads," is emphasized by the experience of the intervening years and points to the wisdom of a union of the educational, commercial, transportation, and industrial interests of our country in aggressive action for permanent good roads.—Congressman Sulzer of N. Y.

REPEAL LAW PROTECTING TREE SQUIRRELS.

Tree squirrels, which are now protected by law, are great enemies of conservation, so a movement is under way to have the next legislature repeal the protective statute allowing a hunter to kill only twelve between August and January.

State Forester G. M. Homans is in receipt of a letter from R. H. Charlton, Forest Supervisor of the Angeles National Forest, in which he gives instances of the harm inflicted upon the future forests of the state.

The Federal Forestry man speaks of the squirrels in the following language:

"I have just returned from a trip through the mountains where the question of having a closed season on tree squirrels was very forcibly brought to my attention. At present the law closes the season from January to August, inclusive, and during the open season stipulates that but twelve may be killed by any one party.

"It is very apparent that these squirrels are causing all sorts of damage. In fact, on the Skyland ranger district, there is hardly a tree that has not got its pile of chewed up cones beneath it and I believe that annually they destroy the chances of millions of young trees in the state. They are first-class nuisances, and by reason of their protection, of late years are increasing very rapidly. I note that up in the timber belt the woods are full of them, and if we continue to protect them it is only a short time until they will overrun us.

"Thought I would call this to your atention so that in case you agree with me you might be able to use your influence in the next session of the legislature to have this law changed. I believe there should be no closed season and let people kill as many as they want to and that sentiment in regard to them should be waived."—Sacramento Bee.

THE ENGLISH SPARROW.

The English sparrow is looked upon by the Minnesota state Entomologist at the Experiment Station as a menace to farmers, not only destroying grain, but also driving away useful birds. The division of entomology suggests that a very humane way of destroying them is to feed them wheat for a few mornings in the winter, in a straight line, in yard or field, and when the birds have become accustomed to the system rake the line with a gun loaded with fine shot. Wheat, it has been said, may be soaked in whiskey and eaten by the sparrows inducing such intoxication that they may be picked up and killed. Destroying sparrows' nests several times in succession, as they were rebuilt, has discouraged nesting in the locality. Destruction by means of active poisons is not recommended by the division because the dead birds are eaten by cats, poultry, etc. The entomologist has discouraged their roosting during the winter under the eaves of his own home and defiling the building, by the use of a small collecting pistol of fine shot, shooting them off their perches at dusk.

The purchase of $100,000 worth of orchard lands at Fargo, Oregon, is recorded. The Fargo Orchard Company bought $40,000 worth of property and invested $60,000 with C. A. Baker. This is one of the largest individual orchard deals ever recorded in that state.

The Price Horizontal and Vertical Centrifugal and Deep Well Pumps are the most efficient and reliable now in use. Pumps furnished promptly and completely installed, if desired, for any services or duty.

Our machinery and plants fully guaranteed, durable, efficient and satisfactory. Call at salesrooms, or write us about Pumps and Pumping Plants and get accurate information.

THE BEST IN THE WORLD; HAS NO EQUAL
The Original R. I. Knapp Side-Hill Plow
Orchard and Vineyard Plow received first premium at State Fair.
If you cannot get our plow send us the name of your dealer and we will see that you are supplied. Has given entire satisfaction for over thirty years. Equally as good for valley as hill sides. We manufacture five sizes—from one-horse orchard and vineyard plow, to the strongest grading plow.

Poultrymen, Attention

We want to tell you what we are doing. We are erecting at the present time Yards and Pens for the largest and most up-to-date plant for fancy poultry in Southern California. We can carry on hand with our new yard about 3000 birds. We sell every standard variety, of Pullet, Cockerel, Laying Hens and Cock. We have them on hand EVERY DAY OF EVERY WEEK OF EVERY YEAR. We have been in the Hatching business for 12 years in the west. The Pioneer Hatchery has been established for several years, and from a small start is now the largest baby CHICK DEALERS IN THE ENTIRE WORLD. No order of any kind in the Poultry Line is too large for us. If you want to sell 100 or 1000 hens or more we will be glad to bid on them for spot cash.

We are shipping at present about 7500 baby chicks per week, of the Reds, Minorcas, Leghorns (White and Brown), Barred Rocks, Buff Orps., etc. Whatever you need in our line we will be glad to make a price on. If we can't sell you better poultry for less money, don't buy from us. INVESTIGATION is all WE ASK.

The Pioneer Hatchery Co., 108, 112, 114, 116 East Eighth
Los Angeles, California

Common Sense in Canning

Responding to demands from all parts of the country we are publishing a book on Canning, and while containing information of inestimable value to the small canner, and housewife it is bereft of technical terms and phrases, so annoying and often utterly unintelligible, that canning may be made easy and absolutely safe.

Tells how to "put up" every kind of fruit or vegetable, in cans or glass jars.

How to can oranges.
How to bottle fruit juices of all kinds.
Why so many unfermented grape juices are insipid.
How to make it equal to best.
Why canned goods spoil after canning.
How to prevent working.
Canned Eggs have been kept fresh, hermetically sealed, for months. Why not now?
Read about it.

Gives exact temperatures to maintain, and when to stop.
Tells percentage of fruit sugars in different varieties.
Saves sugar in canning, knowing this.
How to make maple sugar and syrup equal to genuine, and cleaner, together with hundreds of formulaes readily understood, and easy to follow.
Why canned goods are safer than green fruits.
The best pattern canners for different uses and why.
The things that ought and ought not to be in canning.
More profit canning specialties and oddities than in standards.
Full of recipes for home use, new and up-to-date.
A special treatise upon canning for market. Equipment required, etc.
In book form, and sent post paid to any address on receipt of one dollar, but worth a hundred to many.
Tables give amount of sugar to use for gallon of syrup, any degree, and the amount of salt for different brine strengths.
Order with remittance NOW to insure the work.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grafting Walnuts.

Can wild walnuts growing in this country be grafted over to English walnuts? These trees are not the true black walnut, but they are surely of the walnut family. Can you give me name of some one who has successfully grafter walnuts who would give me information.—Subscriber, Tulare.

If these are the so-called "California Blacks" they can certainly be grafted over to the English. It has been done repeatedly and where proper conditions have been observed, most successfully. We are told that in Sacramento county rows of shade trees originally California Blacks have been grafted in this way. It would be very hard for one to get information as to method of grafting except by observation and even practice. A bulletin on "The Walnut in the North" can be had by writing to State Horticultural Commissioner Jeffrey at Sacramento.

Splitting of Peaches.

I am sending by this mail two peaches and some almonds. The pits of the peaches remain solid but the flesh splits along the "seam" before ripening. Some plums and apricots do the same thing, but not to the same extent as the peaches. The almonds show splitting of the hull much the same as the flesh of the peaches.—Subscriber, Greenfield.

These peaches showed flesh opening clear to the pit, a condition different from any we have observed. It is doubtless due to a physical change due to weather or other influences. To be sure that no diseased condition existed the specimens were referred to Dr. J. Eliot Coit, Acting Superintendent of the Southern California Pathological Laboratory, and he writes:

"We are unable to find any disease or fungus to which this injury could be attributed. I am inclined to think that it must have been caused by some physiological condition or unusual factor in connection with irrigation. At any rate it would be necessary to make a personal investigation on the ground, as there was nothing in connection with the material sent from which we could judge the cause of the trouble."

Millet.

I send seed of grain or grass which some have thought was millet; others said it was sorghum. Will you please name it?—Subscriber, Piru.

This was plainly some form of millet, but to secure the exact name it was referred to the State University. Prof. H. M. Hall writes: "The grass submitted for determination is the broom corn millet (Panicum miliaceum.)"

Bone Meal.

Where may I buy bone meal for plants?—Subscriber, Gridley.

Any seed and plant house should be able to supply you and you should have fertilizer dealers in your own section who can furnish it to you.

White Scale.

Am sending in box insect infected twig from orange tree. What is it?—C. A. S., Rudley.

The cottony, fluted insect is the White Scale or Cottony Cushion scale, or more properly Icerya purchasi, once considered one of the worst pests of the citrus orchards of California. It was brought under control by its natural enemy, Novius cardinalis, which is more popularly known as Vedalia. You can probably secure a colony to liberate on your trees by writing the State Horticultural Commission, Sacramento. If not spraying with kerosene emulsion, or better, fumigating will bring under control.

Hard to Dry Off.

I have a cow that is very hard to dry off. She is within a month or six weeks of calving now and still would give two gallons at a milking if I milked her dry. Have been trying to dry her for three weeks. Instead of decreasing the flow it is increasing owing to a little better pasture.—M. A. K., Holtville.

This cow should be milked and carefully fed. She is a good animal. The highly bred milk cow often does not go dry at all for years. I have one cow's record of twelve years continuous milking and fourteen calves dropped during the time. The milk will often be perfectly good but sometime a week before calving grows salty. We make a rule to use the milk the last four weeks to feed the other animals as it might be objectionable in the rest of the milk.—M. E. S.

Taming the Bull.

How shall I tame or rather prevent becoming cross a fine H. F. bull? Is one year old and is beginning to be mean to horses and men.—A. G. C., Turlock.

I do not believe I would ever attempt to make a bull gentle. It is not worth the trouble. Control him by using a strong halter on his head with a center snap to the ring in his nose. Always use a bull staff to lead him, hooking it into the ring. Make him a good sized corral to live in and leave him there. More youngsters in California are ruined as to temper by letting them run with the herd and then wondering why they become cranky. As to safety I really think that an animal known to be mean does less harm than one of the real gentle pets. They are the ones that should not be trusted.—M. E. S.

Belgian Hare Book.

Where can I get book on care of Belgian hares.—Subscriber, Watsonville.

We do not know of any in print now, unless it be one published by the New England Belgian Hare Co., 299 Washington St., Boston.

Jelly from Cactus.

I make jelly from cactus much the same as from other fruit. However, as the taste is rather flat when used alone I take tart apples, boil, strain and add to cactus fruit juice, using about one large tart apple to two quarts of cactus. Add sugar in same proportion as to other fruit juice. Do not use red apples as they do not make a clear jelly.—L. Dumke, Gardena.

Centrifugal Pump.

I own a walnut grove in the Santa Clara valley that has to be irrigated, necessarily by well and pump. In my section this is done by sinking or digging a pit 6x8 or 8x10 feet, 35 to 45 feet deep. Then to insure a permanent supply of water there is bored from the bottom of the pit wells 75 to 100 feet deep. A centrifugal pump is placed at the bottom of the pit connected by shaft to power at top of pit. During the wet season and later when there is a good supply of water the pump is frequently submerged and run under 5 to 10 feet of water, which in case of breakage or the disarrangement of any part of the pump renders repairs almost an impossibility. Also in a few years the casing of the pit begins to rot and deteriorate rendering repairs difficult to make. Is there any system of pump and well that is reliable, satisfatorcy, and reasonable in cost, that will not require a pit, can be operated equally cheap, with all machinery at the surface?—L. G. H., San Diego.

Nothing will be as satisfactory as a vertical centrifugal pump of high efficiency set at the bottom of a pit. The pit should be walled with brick laid in good cement mortar, making the excavation large enough to have the pit 6 feet 6 inches in the clear when walled, or large enough to allow pump and suction pipes to lift clear. The pit should also have a cement bottom of at least six inches in thickness, well cemented to the walls and around the wells. If the pump is to run under water part of the time both pump and shafting can be attached to a heavy frame which can be raised in case repairs are needed. Bricks laid in cement can be so placed around the bottom of each side of the frame that it can be lifted and replaced in its proper position while water is in the pit. Anchor bolts will not be needed to hold the frame down and side braces will not be necessary if all has been properly placed in line.—J. B. N.

Quantity of Water.

Which of the two following irrigation systems furnishes the greater amount of water per season and how much more is that amount than the other?

1. Irrigation system A delivers a constant flow of one and one-quarter inches of water from April 15th to November 15th for 10 acres of land.
2. Irrigation system B delivers one foot of water per acre per season between April 1st and October 1st.—Subscriber Hemet.

April 15th to Nov. 15th = 214 days, 1¼ miners inches, constant flow (law of March 23, 1901) equals 567,901 cubic feet, in the 214 days; 1¼ miners inches (common usage) 214 equals 454,521 feet. One acre foot on 10 acres equals 435,600 cubic feet. The constant flow gives the most water in either case but will necessitate a reservoir, while in the latter case the water might be delivered in such quantity that a reservoir would not be needed.—J. B. N.

Little Grapes.

I send small bunch of grapes. Some are of small size and ripening, others much smaller than peas and not offering to mature at all. Many vines in this section are similarly affected. —Amateur, Morganhill.

Physiological conditions of vine growth cannot be explained readily, even when one is able to study the conditions of soil and culture over the entire season. This season has shown many new things in vine behavior right here in this old vineyard country. The growers are calling the trouble "vine paralysis." The crop of grapes is short the world over this summer. These conditions of "little berry" we had some ten or twelve years ago quite marked, then they passed away. I again noticed the large number this season among the culled fruit at the packing house.

No, I could not tell anything about the fly on the bean blossom. It may be on old friend or a new foe. Dusting lightly with air slaked lime mixed with road soil, one part of lime to four of dust is a favorite remedy in the vegetable garden. Prof. Woodworth told me that a man could discover new insects every day in the week, for only those injurious and those of striking beauty have really been studied.—M. E. S.

Poison from Sorghum.

I have a large field of sorghum which was planted in a field from which I cut a crop of barley hay, and since irrigating it recently a fine stand of volunteer barley is coming up. I would like to use this for pasture during the early winter after the sorghum is cut. Would there be any danger to cows from poisoning if the sorghum was cut close to the ground? I have fed lots of the sorghum but never had any experience in just this way.—Subscriber, Pixley.

We would have no hesitation in pasturing as suggested, but we have no advice for others. We believe cases of poisoning have been reported but these are so few and far between as to amount to little as a risk. We would refer the inquirer to Mrs. Sherman's answers to similar queries in previous Cultivators. Of course it goes without saying that care should be exercised in turning stock into green feed, that they are not allowed to bloat.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

WANTED.

Farm Manager—Covering years of practical and scientific dairying, sanitary and certified milk, grade and registered stock, East and West, is open for similar position. Or, if preferable, would consider proposition to hire your farm for term of years, on share or cash rental, if carrying 50 to 150 deep milkers, tools, etc.; sterling references. Address Manager, Box 34, Parker, Arizona.

Wanted—Your work pays the expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. United Trade School Contracting Company, 647 Pacific Electric Bldg., Los Angeles, Cal.

Wanted—Man and wife to work on an orange orchard. Man to work in the orchard and wife to cook for three or four men. Each must be competent in their line of work and come recommended. Good wages and steady place for the right parties. Apply to R. D. Williams, Exeter, Tulare Co., Cal.

Wanted—Washington Navel and Valencia Orange, and Eureka Lemon trees. State quantity you can supply, also sizes and lowest price. Address P. W. Cheney, 312 Byrne Bldg., Cor. 3rd and Broadway, Los Angeles, Cal.

Help Wanted—We want several good solicitors to solicit for a high class suburban monthly publication. Good profitable employment to the right party. For particulars address Box H, Cultivator Office, Los Angeles.

Wanted—To lease on shares from 30 to 100 acres good alfalfa ranch with plenty water and good buildings. Address A. Bader, General Delivery, Pasadena, Cal

MACHINERY.

For Sale—Second-hand windmills, tanks, engines and farm machinery that will do the same work as new at half price. 8 ft. Steel Aermotor, tower, 1500 galvanized tank and stand and pump complete, $48; also many others. Small distillate tanks, 50 gallons up. Domestic and irrigating tanks, 500 gallon up to 50,000. 1½ brand-new engine and centrifugal pump, $65; 4-H.P., $75; 6-H.P. and 20-H.P. Fairbanks, 9, 10 and 23 H.P. engines, fine shape. Special bargain, 2-12 H.P. complete pumping plants, Fairbanks and Lambert with deep well Ames double-acting pumps complete, pumping 20 inches water now, at $350; 2-H.P. steam boiler and engine; complete wood sawing outfit, mounted on iron trucks with 9-H.P. engine, complete for $225. Baler, header; gang, disc, road, riding, and walking plows; cultivator, feed rack, wagon tank, fruit crusher, bone grinder, pipe, Fresno and Slip scrapers. Most anything a rancher wants second-hand. Demmitt Co., upstairs, 120 N. Main St., Los Angeles, Cal.

For Sale—38-H.P. Distillate Engine, thoroughly overhauled; price, considering excellent condition, very low. Will guarantee for a year. Bailie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

For Sale—2-H.P. Fairbanks-Morse Jack-of-all-Trades Engine, with or without jack attached. Just as good as new, but much cheaper. Machinery Exchange, Main and Bruno Sts., Los Angeles, Cal.

TREES.

Fine Large Eureka Lemon and Valencia Orange trees, fine for replanting. Choice lot of fine Washington Navels. Order quickly. They are going. Home 'phone 1731. John R. King, Whittier, Cal.

Fruit Trees—Get our advance prices. Choice 4-inch pot roses, 15c. Our tree specials won't last long. Get wise. Ballou's Nursery, Pasadena, Cal.

Marsh Seedless Grapefruit—600 large trees for sale. E. S. Thacher, Nordhoff, Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal.

LIVE STOCK.

Milch Goats—Young three-quarter Toggenburg, extra fine buck and several does, hornless beauties. For sale. B. A. R. Stocker, San Luis Obispo, Cal.

Registered Shorthorn Bulls and Poland China Hogs for sale. Best breeding. P. H. Murphy, Perkins, Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands

REAL ESTATE WANTED.

Wanted—20 acres of raw land with water right, suitable for alfalfa, in coast counties. Small improved place would be considered. H. Turner, Greenfield, Cal.

Hayes, R. B., Poultry Fancier and Rhode

DAIRY SUPPLIES.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey, 108 E. 8th St., Los Angeles, Cal.

OLIVE GRADER

Wanted—Small olive grader in good condition. State make, size and price. O. S. Davis, Corning, Cal.

FARM LANDS FOR SALE.

For Sale—Los Angeles' new water supply from the Owens River Valley opens up the most fertile land in all Southern California. This land is wonderful in its productiveness beyond belief. Potatoes that run as high as 500 bushels to the acre with an average of 330. Alfalfa 3 tons to the cutting. Timothy with 12-inch heads. Corn 70 bushels to the acre. Famous for onions and hogs. The world's prize at Portland Exposition for honey. The finest apples grown on the Pacific Coast, Spitzenburgs and Wine Saps being the favorite varieties. No better poultry country in California. No other land in California to compare with it. Foothill land with gentle slope, giving perfect drainage. One of the most complete gravity concrete water systems in the State now being installed by men whose irrigating systems in the orange belt of Southern California stand as models for modern orchard irrigating. Water from the hundreds of lakes in the high Sierras. An inexhaustible and assured supply. The Southern Pacific's new main line to the East, now nearing completion, places this valley in close touch with all markets. The choicest apple land will be subdivided into tens, twenties and forties. The elevation is 4000 feet. Typical California summers with no excessive heat and cool and restful nights. Mild winters with thermometer at 10 degrees above being the coldest. Practically no rain, about four or five inches during the entire year. Three hundred days of sunshine. Absolutely no fog. The finest scenery in America. The high Sierras at your very door. Trout streams within walking distance. You can leave the Valley in the morning, go to the summit of the Sierras, 11,000 feet elevation, pass a dozen beautiful mountain lakes and return to your home the same evening. Special inducements to early settlers. This land is not for speculators, but for real serious farmers who know the value of good land, water and climatic conditions when they see them. Will send kodak pictures and full descriptive matter upon application. JAMES R. H. WAGNER and H. S. COOK, Room 13, 329 South Hill St., Los Angeles, Cal.

For Sale—20 acres. I absolutely guarantee to you (and will place in escrow money to cover your traveling expenses while making an examination, said money to be paid you in case of misrepresentation) that this 20 is the finest garden silt and level as a floor. With this 20 go 20 shares water stock in a co-operative irrigation system and the water is now delivered to the land. Located in the midst of a prosperous and thickly-settled Tulare county colony, where intensive cultivation and dairying are paying well. 4 miles to railroad station, 2 miles to town. Neighbors next door, near churches, $10,000 school, stores, etc. You can't duplicate this 20 for $100 an acre anywhere in the San Joaquin valley, but I will sell it for considerable less if taken at once. F7764. John W. Thompson, 522 S. Main.

For Sale—40 acres of land planted to beans and corn. About 8 acres of grown Eucalyptus timber, 3 acres in family orchard, windmill, tank, barns, 13 chicken houses, brooder house, everything necessary to run four or five thousand hens. New wagon, 2 good horses, buggy, plows, cultivator, within 4 miles of Santa Maria oil fields. 5-room house, nicely shaded with pepper trees. A good opening for a young couple. Price $4,000. Apply to W. J. Webb, Owner, Santa Maria, Cal.

For Sale—Are you looking for a Southern California alfalfa ranch? Investigate mine. It is near Riverside, in genuine alfalfa district. Fine pumping plant; part already in alfalfa; some land graded and entire tract of 240 acres can be set. All conveniences; in fact, this is really suburban property. Will sell for less than any similar Southern California alfalfa proposition can be bought for. F7764. John W. Thompson, 522 S. Main.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

Fresno County—For sale, 320 acres; 160 alfalfa, 160 Muscat vines; fenced, cross-fenced, 1000 tons of alfalfa this year, 60 tons raisins, abundance cheap water, fine buildings, implements, 8-ton wagon scale; show profit 20 per cent, can make 30 per cent. Can subdivide. E. E. Bush, 805 Union Trust Bldg., Los Angeles.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

Irrigated Land For Sale, Cheap—In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address Manager, American Rio Grande Land & Irrigation Co., Mercedes, Hidalgo County, Texas.

For Sale Cheap—$300 buys a 160-acre relinquishment claim, fine rich level land, plenty of water at 150 feet. Close to a fine market. This is the best bargain you ever heard of. No exchanges. Wm. T. Mantz, Pattiway, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Fruits, Flowers, Sunshine, Progress—All these invite investigating beautiful Hemet Valley, Southern California. Booklet free. William Kingham, Hemet, Riverside County, Cal.

For Sale—El Cajon Grant Land. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. Hawley, 1548 D St., San Diego, Cal.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

Cook & Sons say of them: "They are all from some of the finest birds in this country." Book orders now for next season's hatching. Eggs $5.00 per 15. $25.00 per 100. Day-old chicks 50c each. October delivery. Rancho La Solana, Box 143, Chula Vista, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

Island Red Specialist—[illegible] breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 35, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

For Sale—Eggs for hatching, Black Minorcas, Barred Plymouth Rocks, and Rhode Island Reds, $1.00 per 15, $5.00 per 100; chicks, 12½c each. Also pullets and cockerels. L. W. Neilsen, R. R. 2, Box A 1, Petaluma, Cal.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers

Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME.

A few cockerels for sale. C. C. Bonnell, State Vice-President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

For Sale—One hundred 4 months old, one hundred 5 months, one hundred 6 months old White Leghorn pullets, Watson strain. Healthy and clean. W. J. Webb, Santa Maria, Cal.

Lodi Hatchery—Just hatched, chicks from healthy, heavy laying stock. Booking orders for later delivery. T. C. Hawley, 604 E. Elm St., Lodi, Cal.

Single Comb Brown Leghorn Eggs—$5.00 per hundred, $1.50 single setting. Mrs. E. Foran, Box 445, Visalia, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

For Sale—Thoroughbred Rose Comb Black Minorca Cockerels, Eleanore Minorca Farm strain. W. H. Fowle, Box 55, Route 1, Denair, Cal.

S. C. Rhode Island Reds—Pure bred stock for sale. Pullets at $1.00 each, cockerels for $2.00. L. Haynes, Madera, Cal.

For Sale—A few Ancona cockerels, price $2.50 each. Also some choice White Rock hens $1.00 each. M. C. Shorey, Colton, Cal.

Turkey Breeders, Attention—Wanted, the names of turkey breeders in or near Morganhill. Olive Norman, Morganhill, Cal.

MISCELLANEOUS.

Learn Wireless and R. R. Telegraphy! Shortage of fully 10,000 operators on account of 8-hour law and extensive "wireless" developments. We operate under direct supervision of Telegraph Officials and positively place all students, when qualified. Write for catalogue. Nat'l Telegraph Inst., Cincinnati, Philadelphia, Memphis, Davenport, Ia., Columbia, S. C., Portland, Ore.

For Sale or Exchange—A No. 1 Twenty Century Carbide Gas Plant, 35 burners strong; with two-burner hot plate. Some globes and burners. Cost $100.00, in perfect order. $50.00 cash or would exchange for Bartlett & Kiefer pears and cherries, if No. 1 stock. Address H. L. Bauer & Sons, 737 Spring St., Los Angeles, Cal.

For Sale—Registered Holstein Bulls: 1 to 2 years old. Some sired by Prince Juliana, brother of former world's record heifer, Juliana De Kol. Dam and granddam, A. R. O. cows. Three record-breakers in some of their pedigrees. M. E. Sherman, Minnewawa Vineyard, Fresno, Calif.

Household Department

THE RAGGEDY DOLL.

When the nursery blinds are all fastened and tight,
When the curtains are drawn and it's not at all light,
When my mother has kissed me and hurried away
And I hear them downstairs, very busy and gay—
Then the raggedy doll in her calico dress
Comes creepity creep from the nursery press.
She remembers I'm little and lonely, I guess.

O, she never comes out through the sunshiny days,
The fellows and I don't use dolls when we play,
But she waits till the football and bat are asleep
And she picks up her skirts and comes creepity creep,
Does the raggedy doll in her raggedy clothes
With holes in her elbows and holes in her toes
And her sawdust all dripping wherever she goes.

Then the grizzly black bear who hides back of the door
Goes a-slinking away, and the imps on the floor
Who chatter and point till I cover my head
Go a-scampering off. There's quite nothing to dread
For the raggedy doll waves a raggedy arm
To keep little Me safe from all harm
And she climbs in the crib and lies down, soft and warm.

O, what if she's dirty and really a sight
And exceeding old! She's my comfort at night
With her battered old head close to my head. Have you
A raggedy doll just as loving and queer,
But quite sure to be round when you need some one near?

—Carolyn S. Bailey.

THE HORSE'S PRAYER.

To Thee, My Master, I offer my prayer: Feed me, water and care for me, and, when the day's work is done, provide me with shelter, a clean dry bed and a stall wide enough for me to lie down in comfort.

Always be kind to me. Talk to me. Your voice often means as much to me as the reins. Pet me sometimes, that I may serve you the more gladly and learn to love you. Do not jerk the reins, and do not whip me when going up hill. Never strike, beat or kick me when I do not understand what you want, but give me a chance to understand you. Watch me, and if I fail to do your bidding, see if something is not wrong with my harness or feet.

Do not check me so that I cannot have the free use of my head. If you insist that I wear blinders, so that I cannot see behind me as it was intended I should, I pray you be careful that the blinders stand well out from my eyes.

Do not overload me, or hitch me where water will drip on me. Keep me well shod. Examine my teeth when I do not eat, I may have an ulcerated tooth, and that, you know, is very painful. Do not tie my head in an unnatural position, or take away my best defense against flies and mosquitoes by cutting off my tail.

I cannot tell you when I am thirsty, so give me clean, cool water often. Save me, by all means in your power, from that fatal disease—the glanders. I cannot tell you in words when I am sick, so watch me, that by signs you may know my condition. Give me all possible shelter from the hot sun, and put a blanket on me, not when I am working, but when I am standing in the cold.

I try to carry you and your burdens without a murmur, and wait patiently for you long hours of the day or night. Without the power to choose my shoes or path, I sometimes fall on the hard pavements which I have often prayed might not be of wood, but of such a nature as to give me a safe and sure footing. Remember that I must be ready at any moment to lose my life in your service.

And finally, O My Master, when my useful strength is gone, do not turn me out to starve or freeze, or sell me to some cruel owner, to be slowly tortured and starved to death; but do Thou, My Master, take my life in the kindest way, and your God will reward you here and hereafter. You will not consider me irreverent if I ask this in the name of Him who was born in a stable. Amen.—Dumb Animals.

YOUNG WIVES AND HUSBANDS.

"If every pair for whom wedding bells are to ring this June," says Margaret Sangster in Woman's Home Companion for June, "would take to heart the thought that their private affairs are their own, not to be told to outsiders and not paraded to the world, they would insure and safeguard their self-respect and the permanence of their home. The temptation may arise when first there is a little friction to seek sympathy from mother, sister or intimate friend. That temptation should be trampled under foot. Confidential friends are not invariably to be trusted. With or without the best intention the third party intruding in the affairs of a married couple is in peril of making mischief. Make it a rule to confide wholly without secrets or reserve in one another from the hour that you become husband and wife, and you will have little to fear, though the four winds should blow around your house. It will stand against any tempest and prove itself strong and hallowed, your sanctuary and your castle if you confide in and defend your sacramental union. Never let a quarrel last overnight. Present a brave front to the world. There is common sense in the homely advice to put the best foot forward. Don't begin by thinking that you must have everything on the same plane with your neighbors. Live within your means, although your living be the simplest. Try to save a little each week or month toward coming days when expenses may be larger. Much comfort is theirs who are aware that they have laid aside a provision against accident, illness or an unlooked-for occasion. May heaven bless the young married folk who set forth together in this year of grace. May they live to celebrate their golden wedding and live together, loved and honored, years after that splendid meridian."

ON NAGGING.

My son taught me a lesson on the subject of "nagging" when he was but four years old, and one that I have never forgotten. He had been guilty of a small misdemeanor and had tried to wriggle out of it by not telling the exact truth. I gave him a mild spanking; and, as has always been my custom, talked the matter over afterward. I began by saying, "Now, Robert, if you had told me the truth, I should not have punished you."

He stood before me scraping one foot along the carpet, and he looked up at me and said, "What would you have done?" and I answered, "I should have only talked to you." "Well," he drawled, "how long would you have talked?"

He is a big boy in high school now, but when times arise requiring a reprimand, and I get started, I still hear that little voice, "How long would you have talked?" and I go right to the point and say what I have to say on the subject. But, in the boy's own language, I "cut it short" and never refer to it again unless it is absolutely necessary.—Harper's Bazar.

CHOPPED PICKLES.

The following we clip from the Farm World. It surely isn't classic poetry, but it may be the making of a good pickle:

Of fresh green tomatoes
Take one-half a peck,
Two firm heads of cabbage,
(Cut out every speck).
Fifteen large onions,
And fifteen quite small,
Twenty-five cucumbers
Chop with them all.
Mix grated horseradish—
One pint you will need—
With one-half a pound
Of white-mustard seed.
Black pepper and cinnamon
Finely ground up;
Of each of these measure
Just one-half a cup.
One ounce of celery-seed
Add to this now,
And a half cup of turmeric
You'll need anyhow.

Chop these vegetables up,
Salt down for one night,
And in the morning
Squeeze them out tight:
Cover with vinegar
For two days, you know,
Then drain them and mix in
The spices that go.
Four pounds of brown sugar,
To make a bit sweet,
In six quarts of vinegar
Now you may heat,
Boil all together
Until you shall render
The whole to become
Sufficiently tender.

This receipt has been tested
With greatest success—
There never was given
A better, I guess.
Now, this is the truth—
If you don't agree,
I think that you'd better
Just try it and see!

APPLE RECIPES.

Bring a closely-packed layer of neatly quartered apples to the boil in a syrup composed of one cupful of sugar to two of water, with the juice of one lemon and six whole cloves; draw the pan to the side of the stove, shaking and basting occasionally with the syrup, which should not entirely cover the fruit; cook very slowly, and as soon as the fruit becomes a pale yellow on top, the underside should be of a golden brown; turn carefully with a broad-bladed knife and cook till both sides are glazed. Lift out into a flat dish and serve cold with cream. A large shallow granite pan is best for this process.

Put three and a half pounds of sour apples with half a pound of quinces, all pared and quartered, into a granite saucepan with two quarts of the best cider vinegar, a pound of tomatoes, one of tamarinds and one of dark brown sugar, with four ounces of salt; cook until thoroughly tender and pass through a coarse sieve. When cold, stir in thoroughly one and a half pounds of seeded raisins put through a fruit chopper, two ounces of ground ginger, one-fourth of an ounce of cayenne, two ounces of finely-minced garlic (for some, one ounce would be better), and four ounces of mustard seed. Seal in self-sealing jars.

A German guest at the same house gave me this receipt: Brown some quartered apples in butter; stick strips of almonds into them, cover with claret and water, half and half, add currants, sultana raisins and a stick of cinnamon, and stew until tender. Delicious cold.—A. C.

GREEN PEPPERS STUFFED.

Plunge into boiling water for two minutes one very small and three fine, large, sound green peppers. Remove and neatly peel them with a towel. Split the three large ones in even halves, lengthwise. Keep the smaller one as it is. Remove the seeds, nicely clean the pods, then fill with a stuffing prepared as below. Spread a tablespoonful of fresh bread crumbs over their surface. Lay them on a lightly buttered pan, place over each pepper a dot of butter, then set in a brisk oven for ten minutes, or till of a nice golden color. Remove, dress on a hot dish with a folded napkin, and serve. To make the stuffing, thoroughly heat a teaspoonful of butter in a small saucepan, add three finely-chopped, sound shallots and half an ounce of finely-chopped, cooked lean ham; lightly mix and gently cook for two minutes; sprinkle a teaspoonful of flour over, stir well for half a minute, then pour in a gill of demi-glace. After removing the seeds from the remaining small pepper, finely mince it up and ad to the pan with four finely-chopped canned mushrooms, half a teaspoonful of finely chopped parsley, and the meat of two raw sausages. Season with two saltspoonfuls of pepper and one saltspoonful of grated nutmeg. Mix all well together and cook for eight minutes. Remove the pan to a table, add three tablespoonfuls of fresh bread crumbs, thoroughly stir, then use as directed. —New York Globe.

TOMATOES.

Why not, instead of ordinary baked tomatoes, stuff them with the highly seasoned remnant of yesterday's meat or chicken put through a grinder and mixed with a cream dressing?

Another good stuffing is cold macaroni from which the sauce has been washed off, mixed with chopped green peppers. When the bread-crumb stuffing is used have you ever covered the top thickly with cream or Parmesan cheese?

The average fried tomato is unpalatable because it is floured to death. Try frying the raw sliced tomatoes in plenty of butter, to which a little lard is added to prevent burning. Cook slowly until done, then remove most of the tomatoes, add a little more butter rubbed with flour, and cream to make a thick dressing. If you do not mind the tomatoes being broken, they can be returned to this gravy, otherwise it is poured over them. Season highly.

TO REMOVE MILDEW.

To remove mildew, rub the article with soft soap, completely covering all the spots, then lay on the grass or hang up where the hot sun will strike it. In a few days wash out the soap and boil it. If you have missed any spots, repeat the process. This is a sure recipe and removed the mildew from a white dress for me when it was perfectly black with it and everything else tried was a failure.

Everything is as naught if, as we progress, we do not come closer together in a realization of opportunities for service to our fellows, and in appreciation of the extent of misfortune which may be prevented or relieved. The success which is indicated in the facility of communication, in the activities of markets and in the products of manufactures is important indeed; but its importance must be found ultimately in those other qualities which are represented in a growing solicitude for an improved condition and the real betterment of the great masses of the people. The thing we are proud of in America today is the enlarging area of opportunity, and the concern of those who have been favored by their talents or fortune for those less favored. This is the real pride of our national life.—Governor Hughes.

Some men thrash their horses for things for which they are not responsible.

Hay.

Scott, Magner & Miller say:

We have received during the past six days 5000 tons of hay on the San Francisco market. There has not been much change to note in the situation, as prices have continued along just about as they have been, excepting on strictly fancy articles of hay.

The majority of all the hay that has been coming in is of the medium and ordinary varieties.

There has been no strictly fancy hay coming in to amount to anything recently, as the most of this type that was produced this year has gone into the barns in the country for storage, and will be drawn on gradually through the winter. Therefore, on account of so little having been offered here recently, this special type of hay is wanted by the retailers, and a little premium over current rates is offered this week.

In many sections the fields have been entirely cleared up, while in others where storage facilities are limited there is still quite a little in the fields. There has been somewhat of hay loaded on vessels during the past week for export.

Advices from Washington report that the contract of the United States government for 10,000 tons of hay for use in the Philippine Islands is to be ordered shipped from San Francisco. In view of the fact that the government authorities in Manila have been favorable to timothy for some time past, it is a matter for congratulation to California that their ideas have become changed so that it was made possible for California to again compete for this desirable trade. The placing of this order will have no bearing on the market, as the shipments are to be spread out gradually over many months.

Deciduous Market

SACRAMENTO, Sept, 24th, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, September 23rd, 1910:

Peaches.

Fifty-nine cars. Very few peaches are still left to go forward. Shipment will probably entirely end this coming week.

Pears.

Eighty-five cars. The pear shipment appears much heavier this week than is really the case. Forty-five cars should have been reported before, but owing to an oversight in the railroad office same were not reported. The actual movement of pears this week should be 40, therefore, instead of 85 as appears from this report. Very few cars are still available for shipment and of these few most of them have already been sold on orders booked for some time since.

Grapes.

Three hundred and sixty-eight cars. The grape movement this week shows a falling off of practically 130 cars from the shipment of last week. It is expected that shipments will not increase materially above the figures of the past week. There are still a few Malages being offered, but not many. Cornichons and Emperors are generally being held back to allow the completion of the Tokay movement.

Weather conditions have remained exceedingly favorable since our last report.

Citrus Market

LOS ANGELES, Sept. 28, 1910.

Valencias are still commanding good prices for all good stock. Even the off siezs are doing fairly well with "drys' dragging.

Lemons are strong in every section of the country. Every offering of good fruit is instantly picked up at satisfactory prices.

Shipments.

Citrus shipments to date since Nov. 1, 1909, 29,405 cars, of which 24,829 were oranges and 4576 lemons. To same date last year 37,083 cars, of which 31,077 were oranges and 6006 lemons.

NEW YORK, Monday, Sept. 26th.—Up to time of closing the retail report was not received.

VALENCIAS—	Avge.

Walla Walla, Wash., Jan. 17-21, 1911 H. Dickinson, Secretary; H. H. Collier, Judge.

Jerome, Idaho, January 24-28, 1911. Wm. N. Hardwick, Secretary.

GET READY FOR THE BULBS.

Continued from page 298.

the bulb is three inches below the surface. A rich but light soil is best; water copiously during the growing season, especially if the weather turns warm.

Hyacinths should be planted in open ground, in good rich soil, from November to January, covering to the depth of from 3 to 4 inches. For pot culture plant in 5-inch pots, leaving one-third of the bulb exposed. Keep in a cool dark place 5 or 6 weeks till the roots are fully developed, then gradually inure to the light.

Plant narcissus in light, rich soil, about three inches deep. Often planted in clumps when they are particularly effective; for this purpose set the bulbs about 3 inches apart each way; every three or four years they should be dug up and reset.

Amaryllis may be grown in the open border or in pots. Plant in spring, covering the bulb so that the neck will be even with the surface of the soil.

Lily culture for open ground: dig well, add some sand and well rotted manure (except for Auratum, which will not bear manure) and plant about 5 inhces deep. For pots: give thorough drainage, then fill up with compost, consisting of good, rich soil, peat and river sand; place the bulb firmly on this and cover them about one inch below the surface; give no water until plants appear above ground, then water freely.

Rannuculus should be planted in rich, well drained sandy soil. If the soil is heavy, prepare it by mixing in plenty of sand and well rotted manure to the depth of 6 or 7 inches, or by making a small trench 4 or 5 inches deep, filling this up with sand in which plant the bulbs about 3 inches deep, being careful to press the sand firm around them.

These general directions apply in the main to all cultivated bulbous plants, modified only in minor details according to the special requirements and characteristics of the different varieties. All flower lovers appreciate this division of flowering plants, and it is none too soon to put in a supply of bulbs and get the garden ready for their planting.

SHORT RAISIN CROP.

Continued from page 291.

Summary Showing Imports and Exports.

In the first column of the following figures are given the pounds of foreign raisins and Sultanas imported; the second column gives the exports in pounds of California raisins:

Year.	Pounds.	Pounds.
1900	10,309,489	2,415,456
1901	3,860,836	3,512,164
1902	6,683,545	2,323,276
1903	6,716,675	4,280,028
1904	6,687,617	4,020,418
1905	4,041,689	7,054,824
1906	12,414,855	4,528,502
1907	3,967,151	9,128,827
1908	9,132,353	5,684,541
1909	5,794,320	7,880,161
1910	5,042,683	8,526,114

The quantity of Sultanas imported into this country is not so great as is generally supposed, and the imports of currants have remained remarkably steady for upwards of fifteen years.

As a matter of fact, currants stand in a class by themselves, and only compete with raisins in about the same proportion as apples do with pears.

Year.	Sultanas Imported. Pounds.	Currants Imported. Pounds.
1902	2,030,374	36,238,976
1903	3,055,398	33,878,209
1904	3,850,444	38,347,649
1905	1,685,275	31,742,919
1906	7,372,568	37,078,311
1907	1,052,519	38,392,779
1908	1,638,028	38,652,656
1909	2,760,386	32,842,111
1910	Figures not issued.	33,326,030

There has been a great falling off in the imports of foreign raisins within the last twenty-five years. In 1884 the quantity imported amounted to 56,676,658 pounds, ten years later it had fallen to 27,543,563 pounds, and the last two years has amounted to only 5,000,000 pounds.

On the other hand the export of California raisins has increased in the last ten years from 2,000,000 pounds to 8,000,000 pounds.

The consumption of raisins in the United Kingdom amounts to five pounds per capita; in the United States it is less than 1½ pounds, so that a crop of double the present size should be easily consumed in this country.

A NOVEL CALENDAR.

If the Leonard Coates Nursery Co., of Morganhill, growers of all kinds of nursery stock, can deliver the varied assortment shown on the background of the 1911 calendar just issued, it will surely be in line for a big business. The calendar pad proper has a fund of information as to the planting and orchard operations for each month of the year. All that is very sober, staid and practical. But the background is covered with drawings or various plants which must have grown in the brain of some one connected with the company. There is the Tickia orlogia, the Arthbroomia rigida, the Piggwigia pyramidalis and many other "novelties." The Piggwigia has the pigs growing in a pyramid all right.

COMMON SENSE IN CANNING.

It has been practically impossible for the small canner to obtain accurate and up-to-date information on how to secure best results from canning fruits. To meet this demand the Canners' Supply Company, of 120 North Main St., Los Angeles, has just issued a book on canning which contains most valuable and complete information for the small canner and housewife. Without making use of technical phrases, this book tells how to "put up' every kind of fruit and vegetable, how to bottle fruit juices, can oranges, etc. It gives percentage of sugar in dieffrent fruits, exact temperatures to be maintained, and how to prevent working and spoiling of fruits after preserving. It also contains hundreds of practical and easily followed formulas, and a special treatise on canning for market, describing equipment and calling attention to increased protfis secured from presenting to the trade attractive specialties and oddities. This book costs one dollar, post paid, to any address and may be obtained of the Canners' Supply Company, at the address given above.

HIGH PRICES FOR STRAWBERRIES.

Present conditions indicate fabulously high prices for strawberries next season. Growers all over the country report the shortest plant crop ever known this year.

Now is the time to set out new plants and all those who intend doing so should place their orders for plants early.

W. W. Thomas, the Strawberry Plant Man, Anna, Ill., has a fine supply of hardy, full-rooted, Northern grown plants for sale.

The climate at Anna, Ill., with its dormant season, is the finest in the world for producing highest grade strawberry plants. Plants grown there have proved particularly profitable throughout the South and in California. Mr. Thomas has received hundreds of letters from the largest Southern and California planters to this effect during the 20 years he has been in the strawberry plant business. He probably ships more strawberry plants to the South and Southwest than any two other planters in this country.

His plants are guaranteed pure and true to name and the vitality, energy and fruit producing qualities are unequaled.

For special sale prices and free catalogue, postage prepaid to you, address W. W. Thomas, The Strawberry Plant Man, Anna, Ill.

THE SOIL AS A BATTLE-GROUND

The latest discoveries and theories in regard to the fertility of soil and its regeneration are interestingly set forth in the October Harper's by A. D. Hall, F. R. S., Director of the Rothamsted Experimental Station, England. The author shows how all vegetable life is aided by attendant bacteria in extracting nitrogen from the soil, and how another microscopic animal form has been discovered which preys on the plants' bacteria and is thus the chief enemy to be fought against in improving the growth of the crops and their yield.

Do You Own a Hen?

Do You Want to Build a

- **Fresh Air House.**

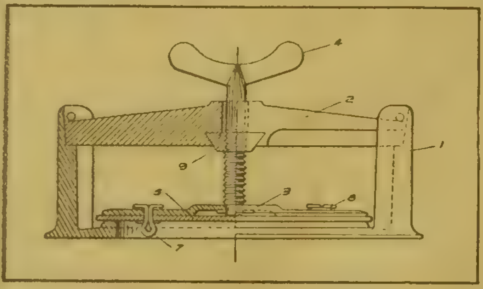
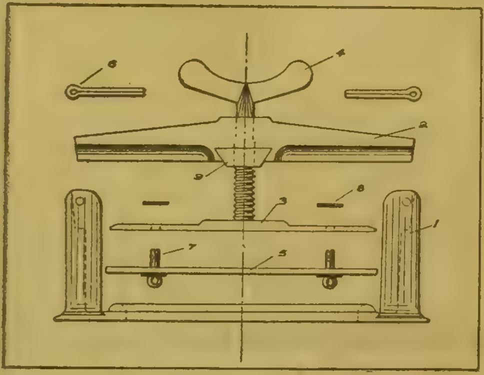
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

THE CORK OAK OF COMMERCE.

A TREE OF BEAUTY AND UTILITY.

The cork oak of commerce is no stranger to the California landscape, for isolated specimens are to be found both in the northern and southern counties, some grand trees flourishing in and about Niles, Alhambra, in Pomona Park, at Chico and other points. Commercially, there is now growing an experimental forest on the slopes of Mt. Hamilton, under the direction of the Experiment Station at Berkeley, which promises good results. Under a recent date Deputy State Forester A. H. Hadsaw advises the Cultivator that in his judgment cork culture will one day become commercially important among California's numerous industries.

More than five acres of Spanish cork oak is under culture and all the trees are thriving. On the older trees there is a good growth of cork fully an inch thick. The trees are seven years old, from twenty-five to thirty feet in height and six inches in diameter.

This is the first time any attempt has been made to grow cork in this state. At the present time, the bulk of cork used in the United States is imported from Spain and Portugal.

Like our native oaks it is an evergreen, is of long life, and attains an average maximum height of about 40 feet; the acorns or seeds are of sweetish taste. But beyond its economic values for its bark, the tree possesses other attractions that render its planting desirable. As an object on the lawn, aligning the public highways, and grouped or planted singly in parks and public grounds, it has much to commend it from a view. point of beauty and comfort. Its umbrageous habit makes it especially desirable as a shade tree.

Renovating the Orange Tree by Systematic Pruning

By C. R. Paine of Crafton

The observer of plant growth will note that, in the ordering of nature, leaves are so arranged as to give the greatest possible exposure to sunlight and air. A growing tree of any kind, in a state of vigor, has the most active growth in the terminals of its branches, the top branches increasing faster, until the tree attains its normal height, while the lower branches, especially when trees are crowded, gradually weaken and die. This is particularly noticeable in forest growth, where the fir tree bears its cones only on the topmost branches, and in pines, where the branches higher up produce their cones (at the ends). Among the multitudinous blossoms of the orange tree, on the new spring growth, it can be fairly well predicted which particular blossoms will mature to fruit, for it is at the very ends where most plant food is being made.

The law, that favoring conditions of growth are found in exposure, universally applies.

In cultural conditions, where the orchardist is in control, it is policy, therefore, to secure the largest possible number of such points of life activity in obedience to such law.

A young orange tree and one approaching the maturing stage can do fairly well without assistance in modifying its form, but in the latter, the maturing stage, it is time to interfere to secure the ultimate health of the tree and future profit.

In the orange tree, the vigor of its growth under usual stimulating conditions, a heavy foliage and fruitage is produced, with the result that branches above, smother those below, shutting out from them the normal supply of air and light, without which they suffer and ultimately perish. While the tree is young, and not of large circumference, these influences are so near to the poorly situated leaves, that their suffering is less and little noticeable, but, when the tree becomes of larger proportions, it is inevitable, that, when untended, the smothered branches become of little value and finally die, in which process of gradual decadence they are rarely of use themselves and become hindrances to the more profitable parts of the tree.

The plain inference from these conditions, if the grower desires to profit by obedience to natural law, (though he may have no special knowledge of plant physiology as a science) is to cut out such failing branches. The sap flow to them is lessening daily; the bark color is darkening; the master branch becomes bright and vigorous and the flow of the life fluid makes active growth but an inch or so along the old channels.

This should be done as soon as the weakened state appears, for, when they are dead and dry they have little or no effect in shading, or hindering air circulation, but offer mechanical obstruction only. If the work of removal is done while such branches are still green, the beneficial effect is apparent to the good branches remaining, which get the needed exposure. The good branches, thus relieved are, however, subject to the incubus of one or more lively shoots growing upon them, which must be taken off before they do mischief to their mother branch, for their upright growth gives them advantage of position and they would dominate the branch that is best for fruiting. If, however, they are not aspiring, but modest fruiting growth, they may be considered as part of the principal branch.

Not so, however, those strong, rank-growing suckers that issue from the trunk, or on main limbs near their junction with the trunk and shoot upward with an intensity of energy as if to become the whole tree. They would, indeed, if unmolested, change the character of the tree in its regular habits of moderate growth, accompanied by the production of the finest quality of fruit, which should be the result of cultural conditions. These exuberant parts are not needed for tree renewal, unless one is willing to give up direction of growth and submit to the wild ways of nature. Cut off, then, these intruders, before they suppress the activities of the parts they grow upon, which bear the better fruit, and which, in time they would supplant.

When a large orange tree is made clean on the inside, that is, hollowed out by the process of breaking and cutting out the dead twigs and branches, it is obvious that little or no good is done, so far as providing for access of light and air; neither does good, but rather harm ensues from the practice of clipping the outer surface of the tree unless a more shapely appearance is considered the object, for the head of the tree is closed by the succeeding growth to important natural influences.

Of course, there can be no objection to cutting off large protruding parts, or dangling limbs.

Each limb, so treated, completes the pruning of the tree at this stage of its life, provided suckers have been kept out, and cross limbs eliminated from the beginning.

The work thus far described, keeps the tree of middle age in good condition, in constant thriftiness, because neither the younger parts nor the used up older have been permitted to interfere with the best parts.

Then there comes a time when the tree has the appearance of age, the signs of which are enfeebled growth of the ends of the limbs, especially of those directed upward. This is shown both in the yellow and smaller foliage and in the inferior quality of the fruit. The leaves, when not wholly yellow, are green only in the veins or for a little distance on either side. Life forces persist longer in the veins because they have a fibrous, more woody structure than other parts of the leaf blade. This small proportion of the whole leaf surface having green parts, (chloroplasts) which alone have the power, under the influence of sunlight, of food manufacture, contributes very materially to starvation of the tree. This may go on so far that, in the natural course of things, the whole exterior of the tree is surprisingly thinned by lack of good growth. It is surely an alarming state of decadence.

Among the causes of the failing condition of the outer parts of the limbs are soil washing by concentrated rainfall or careless irrigation, or lack of sufficient humus material. These causes we may know. Others exist, like unsuitable proportions and quantities of fertilizing material, which have to be guessed at. So, of soil tending, which may have been too deep and too frequent in light soils, resulting in burning out of the humus and too shallow or too infrequent or untimely cultivation in heavy soils. Whatever the cause, which our scientists and practical orchardists must unitedly study and work out, a remedy, for a time at least, is naturally found in resorting to a more robust location of growing and fruiting points upon the still vigorous larger parts within the head of the tree. The tree has the opportunity for revival by the openness brought about by the exhausted and feeble growth of the outer parts. Upon these larger parts of the limbs, and from the trunk appear, under what must be favoring conditions, new shoots with large leaves issuing from newly-formed fruiting-wood. The tree is then made up of two quite opposite features, a healthy, vigorous interior, productive of merchantable fruit, the outside portions of the same limbs, bearing some fruit of inferior grade; and other parts of the same being useless brush of which the neglected tree cannot rid itself.

The work described, as belonging to the first stage of pruning, postpones the deterioration of the branches, if it has been begun in sason, and been periodically performed by intelligent labor. But when this serious alteration in the condition of the tree, now so prevalent, is coming on, or has been reached, a new practice becomes necessary, which is based on the same elementary principle as the first; namely, free access of atmospheric influenecs.

It may be said, by the way, that basic principles are the only reasons entitled to respect as foundations for methods of work.

The failing top branches afford a vantage ground, incomparably superior to the side branches, where the first work is done, for the admission of air-contained food—carbon dioxide —and light unhindered, direct from the sky above, which is the agent for its utilization to provide the carbohydrates, sugar and starch.

Limbs, though large, that constitute the upright part of the tree, and branches that have formed an angle with them, may be freely removed, even though somewhat fruitful. The open space resulting from this seemingly severe pruning, though an irregular space, may be likened to an inverted cone.

When the cuts are made and the old limbs tossed out, the barren space that meets the eye seems like a waste, but it is, in reality, the battle-ground whereon the tree will regain new life. The proof that such is the case begins to come at once for it is in the spring, when the crop is off, that the opening is made. Within the tree, what seems almost a miracle of change, takes place; along the side limbs from junctions to terminals, cohorts of vigorous branchlets arise, their new leaves, broad and green, at work in food-supplying, as if the tree were again a sapling. Such new leaves are rarely marked with streaks of yellow, the indication of lack of ability to manufacture plant food.

The large parts of limbs, bare before exposure, become regions of lively growth by the formation of adventitious buds. Here is elaborated sap in abundant supply in the past, lying between the bark and wood, which is the pathway of distribution of nutritive material or manufactured food-stuff. Not only is food here in circulation, that may be made into plant form by growth, but there is always an accumulation of stored food in healthy trunks and limbs and medullary rays, and the utilization, for growth that is beginning here for the first time, is the attractive force that draws it to the point of need. This accounts for the new development which receives the reserve until the new leaves can manufacture for themselves.

Intermingled with the short-stemmed, broad-leafed fruit growth, are a few new sucker-like shoots, especially where the cuts were made; these do not grow lank and long as do suckers in an unpruned tree, where the open spot of light they aim to pierce is small. These and such of the newly-formed fruit branches as would be in excess, especially those higher up, should be taken away, and the open space, once secured, should be maintained as the most important region wherein increased vitality can be gained.

Within the first season, and increasingly so in successive seasons, the new foliage throughout the interior as well as in the center becomes fruitful. The side limbs have impelling influences to growth, not alone at or near their extremities as, at first, but all around them, and dead wood, once removed, can never form again.

When these excellent results are gained and the grower reviews the processes by which they were secured, he no longer laments what seemed destructive work in cutting out decadent limbs at the side and the top, and is ready to subscribe to the policy of avoiding, in his business as a fruit grower, the distribution of nutrition to regions unproductive of good fruiting branches or fruit. He may, too, doubt the advisability of the plant to permit tree renewal by natural sucker growth, which also has its origin in regions of active sap flow and storage, to the detriment of regular branches.

It may be thought to be well enough to depend on the weight of foliage and fruit of aging trees to open the top enough to receive equal benefits with the artificial treatment described; but such benefits follow only in a minor degree, and are temporary, because new growth in the top may be thrifty enough to soon fill such an opening and shut out the reviving agencies. Such dependence is not wise, for the space must be large to bring about the desired renewal.

Growth has its limits and age will struggle for control, but there is still a third resort, by pruning, to rehabilitate a decadent orange tree and keep it well at work.

As has been said, the reservoir of vital force in that part of the tree above the ground is in the trunk and larger limbs; the weakness appears in their subdivisions, which have small and few, yellow or variegated leaves.

Since rejuvenation is from within, the poor old limbs may be cut back to points of vital force where new shoots have been made ready, by superior location, from the work previously done, to take the place of the old. The tree is then new without as well as within.

When a grower with his best judgment and in due season, in the late summer and again in the winter, has provided sufficient available plant food, has put his soil in mellow tilth after the season's rains or irrigations, and has avoided untimely applications of cold water at the critical period of the setting of the fruit, but has failed to provide in the tree itself, extra supplies of growing points in stable locations, in so far he has invited crop failure; for, when the chill nights of spring arrive, and the dreaded June drop period of hot days and drying winds comes on, it is only in the most vigorous regions that the young fruit will have staying qualities. Drifting to success in orchard methods is impossible.

The different processes, all performed in subservience to natural law, have kept alive and in constant use the vital energies, have provided new and better areas for fruit production with a scarcely appreciable elimination of such area, contrary to the plan of total decapitation at occasional intervals, and, if soil and cultural conditions have been favorable, have left the tree to a green old age.

Citrus and Tropical Fruits

THE WHITEFLY ENEMIES OF CITRUS.

By A. W. Morrill, Entomologist, Arizona Horticultural Commission.

THE whiteflies destructive to citrus, are more dreaded in sections where they do not exist than any and all other citrus pests, with the possible exception of the Morelos orange worm. This apprehension is well founded, since the difficulties met with in the successful control of whiteflies are much greater than in the case of the scale insects. Even the mealy bugs, which are so difficult to control by artificial means—spraying and fumigation—are not so much feared; since in their case, there is promise of successful control by means of natural enemies.

The Cuban whitefly, recently introduced, is not well enough known to estimate its importance. The spotted-wing fly is more destructive to grapefruit and, on the average, is less destructive to the orange than is the citrus whitefly. With its restricted distribution and reduced average damage, the spotted-wing fly is estimated to cause a total loss of between one hundred and one hundred and fifty thousand dollars per year in Florida; while the better known citrus white-fly is responsible for losses amounting to more than a million dollars annually. These losses will continue to be sustained until systematic control measures, such as advocated in forthcoming reports of investigations of the United States Department of Agriculture, are put into effect.

The spotted-wing fly, so far as known, has no other food plants than citrus. In its habits, life-history and seasonal history, it differs in certain details from the citrus whitefly, but in a general way, the two species are much alike. The latter species being the one of widest distribution as well as the most destructive, is hereinafter the subject of discussion.

The young stages of the whitefly are small and scale-like, attached closely to the leaves, usually to the lower surface, and never developing on stems or fruit. The citrus whitefly has a long list of food plants aside from citrus—china and umbrella trees, cape jessamine and privets being the most important. The adults are white, winged insects in both sexes. About two-thirds are females and each of these lays, on the average, about one hundred eggs.

While the sapping of the leaves in itself is sufficient to injure the trees to a slight extent, the most important injury is due to the resulting sooty mould fungus which develops on the honeydew excreted by the insects, as in the case of the mealy bug, black scale and other unarmored scales. The yield of fruit is greatly reduced, and the portion of the rind of the fruits which is covered by the sooty mould may fail to color up when the fruit ripens or may remain green indefinitely. The loss in the value of the crop alone is generally considered to amount to more than 50 per cent, while the deterioration in the value of infested groves is a considerable loss in itself.

The most economical control of the citrus whitefly is a matter based on a more thorough knowledge of the insect itself than is required in the case of any other citrus pest. Accordingly, the investigations of the insect and of the methods of controlling it have been extensive; more so than with all other citrus pests together. For direct remedies, spraying and fumigation are both adaptable, but the former method is the more expensive, and few can obtain satisfactory results with it. The second method is more thorough and profitable when conditions are such that it is practicable, or after conditions have been modified to make it practicable. The present lack of properly organized efforts is the greatest obstacle to successful whitefly control in Florida.

The citrus whitefly has no natural enemies in this country which are able to cope successfully with the pest. There are several fungous parasites which attack it, and while, periodically, these bring the insects under subjection, the average losses sustained are not reduced to a satisfactory extent. There are no ladybug or other predaceous enemies of importance in this country and true parasites are unknown.

The investigations of the citrus and spotted-wing fly have not supplied any evidence of value in estimating the effect of climatic conditions in arid regions. At one time it was thought that these insects could not thrive in California, yet their introduction there into the drier and hotter interior valleys has fully demonstrated their ability to thrive there as well as in the most humid regions in Florida. Whatever retarding effect the dry climate in California may have had on the multiplication of the insects was probably counterbalanced by the unfavorable effects on fungous and bacterial diseases, which themselves have a retarding effect in humid climates.

THE WHITE FLY INVASION.

Citrus growers of this state can certainly congratulate themselves that the Whitefly invasion of a couple of years ago was thoroughly stamped out,—thanks to a corps of efficient horticultural officers. What this relief really means to the welfare of orange and lemon trees is best told in the following quotation from the Tampa (Florida) Tribune:

The white fly, that dread insect pest which threatens the orange trees of this state, and whose rapid spread has caused dismay in the hearts of the growers, is the worst that has ever been known in this section, according to old residents. Growers declare that something must be done at once to stamp out the pest in order to protect the orange industry and it is hoped that the investigations and experiments now being made by the government will reveal some effective method of dealing with the matter.

For the past several days the flies have been so thick in the atmosphere during the late afternoon and early evening in some sections of the city that a person could hardly breathe. They get into the eyes and mouth while riding on cars or in automobiles. Many Tampans have not known what they were and have wondered what caused the thick cloud which covered them like light snow. There must be billions of the insects within the city.

It is agreed that the time has arrived for action and that something should be done without delay. The city affords a good breeding place for them on account of the different trees and different kinds of foliage which it affords. The insect has a fine ground on which to grow and develop. It is declared that China trees, frequent in Tampa, form fine breeding places for them, and orange growers advocate the cutting down of all China trees.

BEGINNING OF THE CALIFORNIA ORANGE INDUSTRY.

For nearly three-quarters of a century oranges had been produced in Southern California, but not for exportation. The first trees were grown at San Gabriel Mission about the beginning of the last century. A few had been planted at other Missions of the South and in the gardens of some of the wealthier families. The first trees grown within the limits of the Pueblo of Los Angeles were planted in 1815. William Wolfskill, in 1841, planted the first orange grove of any extent. It was on what are now the Southern Pacific depot grounds of Los Angeles. He added to his original orchard until it covered seventy acres. In the later '60s it was reported to be pay-

ing at the rate of $1,000 per acre net. This yield was probably exaggerated but it was sufficient to induce the planting of orange groves wherever suitable land with irrigating facilities could be procured.

The extraordinary profits made from oranges by Wolfskill and a few others who had bearing orchards in the later '60s and early '70s started an epidemic of orange growing. Like the silkworm fad large profits were made from the sale of nursery stock. It was a very scrubby sort of tree that could be bought for a dollar, and a thrifty two-year-old commanded two to three dollars at the nursery.

As it took about seventy-five trees to plant an acre it required considerable ready money to embark in the business. Many prospective orange growers, too poor to buy stock, raised their own from the seed. It required two years longer to wait for returns but with them money was more valuable than time. If oranges were apples of gold the seeds in those days were golden nuggets. The visitor to a grove might be indulged in a luscious orange but at the same time he would be solicited "to save the seeds."—J. M. Quinn, in October Pacific Monthly.

HAWAIIAN PINEAPPLES.

George N. Moran, New York.

An excellent example of the possibilities of the new territorial possessions of the United States and an instance of what brains and business energy can help a young man accomplish, is furnished by the history of the pineapple industry in Hawaii.

Trade statistics show a truly wonderful commercial growth to the credit of Hawaii in the last twenty years. In 1890 her exports were $4,711,417 while last year they were $17,780,778. In 1890 her shipments to the United States were $12,313,908 while last year they were $40,432,312. Sugar leads in the products of Hawaii with fruits and nuts second on the list but while the output of sugar has not materially increased in the last few years the tonnage of fruits from Hawaii has shown a remarkable growth during that same time. Virtually all of the land adaptable to pineapple cultivation has already been planted, and that industry now is one of the most important on the Hawaiian list.

The man said by governmental and lay students of the Hawaiian situation to be most largely responsible for the development of the pineapple industry in Hawaii is not yet thirty-three years old. He is James D. Dole, Harvard graduate, son of the Rev. Charles F. Dole of Jamaica Plains near Boston, and a cousin of former Governor Dole of Hawaii. Mr. Dole picked out Hawaii, before its annexation to the United States, as a place where a young man with a little money and plenty of energy might find better openings than in the crowded offices of a big city. He introduced new ideas, some learned theoretically in college and some scientifically adapted from the methods then in vogue. He found that there was only one cannery with a total yearly output of only 1,000 cases and that there was no well developed market for the pineapples. He built a model pineapple cannery in 1903 that showed an output of 1,800 cases the first year of its operation. Today the Hawaiian output is more than 200,000 cases annually and the market for the product has been wonderfully enlarged. In 1901 there were forty acres under pineapple cultivation while today there are more than 5,000 acres planted in pineapples and the United States is now at or near the head of the list of pineapple producing countries.

The annual meeting of the stockholders of the San Dimas Orange Growers' Association was held Sept. 19, D. C. Teague presiding. The report of the management showed that 620 cars of oranges have been shipped from there during the past season, while nearly $500,000 was distributed among the growers, this being $1.51 per packed box.

LEMONS CURE MALARIA.

The following, taken from the New York Sun, states that many have been cured of malaria by the use of lemons:

"Some twenty years ago I was a victim of the disease, and, of course, took the quinine treatment, till my head began to grow big and roar internally and infernally. A change of climate was recommended, and I went to Saratoga, but my head continued to require more space and the roaring became louder, till I thought I would go mad.

"One day my husband chanced to see an article written by a physician on the Pacific coast, in which he said he had for 15 years been trying to find a remedy for malaria which would not have the injurious effect of quinine. He was successful, and in many places where public works had been abandoned because of malaria among the men they were resumed. His cure was very simple and within the reach of all. Take one lemon, wash thoroughly with a brush and hot water till all germs are gone, cut in very small pieces, using skin, seeds and all; cook in three glasses of water till reduced to one, and take this while fasting. I took it before breakfast, and in less than a week I was myself again. Since then I've had no use for doctors. If I feel a little 'off' I resort to the lemon cure and all is well."

EXTERMINATING THRIPS.

Citrus growers at Globe, Arizona, are carrying along a series of experiments which they think have led to some discoveries with reference to control of the thrips. We note in an exchange:

Working independent of the government entomologist, the Globe orange growers believe they have found the most feasible method of keeping down the thrips, the results of the past season seeming to bear out the contention of the growers of that section that their plan is the most satisfactory one.

It is the theory that sprays are but partially effective, as the thrips is a migratory insect. They have devoted their attention to an attempt to control the pest through proper cultural methods. Cover crops are discouraged, fertilization being done carefully after soil analysis shows the ingredients which the soil lacks.

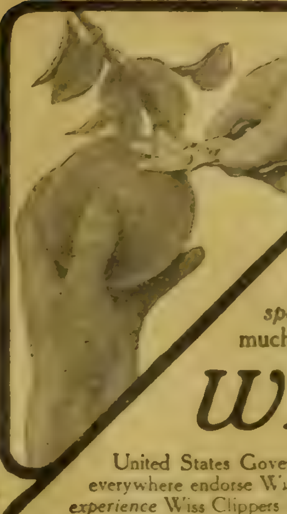
Every vestige of vegetation is kept from the rows between and under the trees and liberal and even profuse cultivation of the ground is encouraged. This year those orchards in which this method has been followed show practically no effects from the thrips, not more than six to ten per cent of the fruit being scarred from the insects, and most of that in such small degree as not to seriously affect the grade.

THE NAVEL IN HISTORY.

Go away from home to learn about your own affairs. Coleman's Rural World of St. Louis is responsible for the following history, bearing on our popular orange:

The first we knew of the Navel orange, which is very valuable not only on account of its fine quality and taste, but also because of its being seedless, is of a single tree that was found growing on the northern shore of the Mediterranean sea. This was about the year 1565, or nearly 350 years ago. A monk in a monastery in that far away country painted a picture of the fruit and wrote a description of it, both of which may be seen in the library of the Roman Catholic University at Washington, D. C. Grafts of this tree were taken to Spain by the Moors several hundred years ago and from Spain the trees were carried to South America by the Spaniards.

As intimated in the Calexico Chronicle sometime ago the Inter-California Land Company, which is the Holt syndicate engaged in developing the 32,000 acre colony at Cocopah, 16 miles from Calexico on the Inter-California railroad, has sold out complete to the Cudahy Packing Company. The price is said to be a million and a quarter.



Stop *Bruising* Fruit and *Losing* Money.

Every time your clippers pierce an orange's skin you open the way to decay. Usually the cut is too small to *notice*—and the bruised one is crated with the good. *You* know that *one decaying orange may spoil an entire crate*—you lose just that much money. You *won't* bruise fruit if you use

WISS ORANGE CLIPPERS

United States Government Experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they *know by experience* Wiss Clippers *last longest, do best work* and *save money* by *minimizing* the liability of bruising the fruit.

The blades are specially curved and ground—the points and outer edges are smoothened and rounded to avoid bruising. Handles are shaped to prevent tiring of the hand. Wiss Orange Clippers will give years of service — and are unrestrictedly guaranteed to give satisfaction. *For sale by all dealers.*

Wiss Solid Steel *Pruning Shears* will snip a broom handle and cut the most delicate tendrils. All parts are interchangeable and any broken parts can be readily replaced. 9-inch size, $2.25.

Tree and Shrub Fruits

RESPONSIBILITY OF NURSERYMEN.

THE nursery business of the Pacific Coast is on a materially different basis than in the East, there the "tree agent" is the principal agency of tree distribution, and the success of the nursery depends upon the glibness of this agent. Californians wish to come in contact with the man at the head of the nursery work and the "agent" would starve here. Besides the orchardist knows his own mind and is not "talked" into buying what the agent wishes to sell, as is indicated in the following clipping from American Fruits:—

"Orchard planting is somewhat like life insurance in more ways than one. It is an investment that brings a great deal of satisfaction, and it usually pays its annual dividends, but the most decided similarity is the fact that a great deal of talking must be done by some one on the subject before the policy is ever written, or the orchard planted. In the case of the orchard this talking usually falls to the nurseryman or the salesman. There is scarcely a home that is provided with fine fruits through the season, but its owner was talked into it by a tree man. Go further and you will find that a large percentage of the commercial fruit growers was also originally argued into the business by energetic tree men. Study the history of the prominent fruit sections where peaches are shipped by the hundred carloads, and if you will trace the business back to its infancy you will find almost invariably that it was started through the work of some tree salesman. The credit for production of the finest peaches in the world, therefore, may well be divided between the nurseryman and the orchardist. This is a big responsibility which the nurseryman carries, and therefore he should exercise care that he grow only the best varieties of fruit and see to it that all orders are filled with good stock. The nurseryman should be an intelligent guide to the fruit grower. The average planter looks to him to be well posted as to what, when and how to plant, and the nurseryman should aim high in his business and try to post himself so thoroughly that he may not have to turn any customer or seeker for information away unsatisfied. The position of nurseryman is one of great importance to the country. It is a calling that one cannot just drop into and succeed at. He must go into it with earnestness and enthusiasm and make it a life study as well as a life business in order to be of any value to the country, or make anything out of it for himself. The nurseryman only serves his part properly in the business by making it his permanent occupation, and he cannot give his customers satisfaction unless he is competent to advise a tree planter as to the proper trees for planting under any conditions."

TILLAGE OF SMALL FRUITS.

The purpose of maintaining tillage is for perpetuation or maintenance of desirable soil conditions, secured through preparative tillage.

The one should follow the other closely, else much of the good result secured through the first will be lost.

The object is to preserve that ideal, moist and mellow condition characteristic of the ideal plant and seedbed.

How to maintain a maximum supply of soil moisture is the greatest of the problems to be solved by the fruitgrowers.

However, it is only through the fruiting season that the moisture problem assumes a serious aspect.

We have proven to our satisfaction that in so far as the growth and development of fruit plants are concerned, tillage can be made to conserve moisture sufficient to promote a satisfactory growth.

Time and again we have secured ideal growth in cane and plant, notwithstanding severe, protracted droughts, just by exercising watchfulness and persistency in maintaining the earth mulch.

There is a continuous upward movement of soil moisture. It is caused by the laws of equalization.

If the supply of soil water among soil grains is greater at one point, water from these congested points flows toward those points where there are less amounts, until there is uniformity in the supply.

The manner in which water is evaporated from all surfaces exposed to the sun and air currents is well known, and it is through the working of these two principles that soil moisture is so quickly depleted where no measures are taken to prevent the loss.

To prevent this depletion of soil moisture through surface evaporations the surface of the ground must be protected from the sun and air, or the upward flow of soil moisture intercepted ere the surface is reached.

The former is accomplished by covering the surface with straw or other material, the latter by stirring the surface soil grains, which break up the interstices aforementioned, checking the upward flow at the point where the undisturbed and loose soil grains meet.

So long as capillary movement of soil moisture is held in check by this layer of loose soil there can be but little surface evaporation.

To preserve an ideal earth mulch, however, requires frequent stirrings, depending upon the character of the soil.

As a rule the surface soil should be stirred once in seven days and particular care must be taken to cultivate freely.

The conservation of soil moisture is but one of the results secured through efficient tillage, for all weed-growth is held in check and ideal soil conditions maintained favorable to soil activity and development of the root-system of plants.

How deeply shall we cultivate? The strawberry is a pronounced surface-feeder so to speak, hence, cultivation should not exceed two inches in depth for the plant must fill the soil full of its roots and rootlets if it is to make good at fruiting time.

The roots of bush-fruits reach deep into the soil, hence in their culture it is advisable to cultivate more deeply than with the strawberry—say four inches.

In the growing of bush-fruits, the grower may maintain the dust mulch through the entire season, and by this measure good crops are secured, though a drought may be prevailing through the fruiting season.

Some growers advocate the suspension of tillage operations during the blooming time, which in our opinion is a mistake.

The theory is that dust particles thus set in motion come in contact with the pistils of the blossoms, interfering with complete pollenization.

We have noticed no such ill results and we begin cultivation in the spring just as soon as soil conditions will permit, and never let up in our efforts until the harvest is over.

Of such importance do we believe the work to be that we would cultivate by moonlight rather than neglect the plantation during the blooming and fruiting season.

With strawberries, however, this is impracticable, as the strawberry blossoms and fruit are very close to the ground, where they are subject to contact from dust and soil particles. —Farm World.

Two cars of honey, comprising 520 cases of 120 lbs. each, were shipped from Tulare, September 24. The market price is $7.20 a case. Two other cars went out a short time ago.

A watermelon, weighing fifty-four pounds, was grown by J. M. Waggoner of the Dakota colony, at Kerman. The melon was thirty inches in length and thirty-three and a half in diameter.

TREES

Deciduous, Citrus and Ornamental Trees

Every one true to name. Well developed, strong, healthy roots. Grown in the finest soil and under perfect conditions.

Our System of Growing

and caring for all our trees and the superiority of the stock from which we propagate our trees are points you should consider when buying.

We have the largest and best stock on the coast, and our trees are all properly packed for shipping, so they will reach their destination in perfect condition.

Never Buy Cheap Trees

for such purchases are usually a great loss rather than a saving.

Everything in Trees, Fruit and Ornamental

There is not a desirable sort that will not be found in our list.

Grape Vines

We are the largest growers of raisin, wine and table grapes on the Pacific coast. Our vines are carefully graded. It is worth your while to figure with us.

Calimyrna Figs

The best and most profitable fig for all commercial purposes. It is the genuine Smyrna fig of commerce. We were the first to produce the Smyrna fig in the United States and to demonstrate its great commercial value here.

Burbank's New Creations

We are sole propagators and disseminators.

Palms and Roses

No better stock in the state than our field grown roses.

California Horticulture: The Fruit Growers' Guide
By Geo. C. Roeding

120 pages, 7¾ by 10¾. Beautiful lithographed cover. Profusely illustrated with half-tone engravings and color plates. It not only lists but describes 2000 varieties of trees and plants. Contains valuable suggestions on soil, preparation, planting, cultivating, irrigating and pruning. Price mailed, 25 cents.

PAID-UP CAPITAL $ 200,000.00

VALENCIA RAISIN CROP SHORT.

Consul Robert Frazer, Jr., reports as follows in the Daily Consular and Trade Reports under date of September 7:

The reports of damaged and short crops of raisins and currants received from the whole of the Mediterranean zone producing these fruits seem well founded. Owing to an irregular and unfavorable spring, the increased ravages of the phylloxera, and a persistent summer drought, which has partly dried many of the sources of irrigation in this section of Spain, the yield of the present raisin crop will undoubtedly fall considerably below the average. The latest estimates make a total of only 20,000 tons, which would be 10,000 tons below the normal. Latest advices from Smyrna report a probable crop of Sultana raisins of only 25,000 tons, and Malaga estimates are 30 per cent below last year's total. Stocks of Valencia raisins are practically cleared both at Denia and in the important dried-fruit centers of London and Liverpool, where prices show a sharp advance of 2 shillings (48 2-3 cents) a hundredweight (112 pounds). With the exception of Sultana raisins, the stocks of which reached some 6,000 tons in London at the beginning of July, the new crops will appear on practically bare markets, and the outlook is regarded as exceptionally promising for Valencia growers possessing even reduced crops of good quality. The district of Jabea shows the greatest shortage this season, while a few favored sections of small area promise a fine abundant crop of large fruit.

SOIL CONVENTION.

A very great disappointment was in store for those attending the soil convention which for some weeks has been announced to begin on Monday morning of this week in the Chamber of Commerce Building at Los Angeles. Two of the men best informed in soil chemistry and physics were scheduled to lecture on soil conditions of California. These were Dr. Cyril G. Hopkins of Illinois and Dr. F. H. King of Wisconsin. Both arrived in California a couple of weeks ago and spent their time up till Saturday investigating soil conditions here. At that time Dr. Hopkins received a telegram calling him home on account of the serious illness of his wife, so that when the audience was called to order on Monday morning, Dr. J. Eliot Coit was compelled to announce this failure in the program. Dr. King, however, is a host in himself and is holding the attention of the big audience.

In addition Prof. J. H. Norton and Prof. C. B. Lipman are giving lectures and answering questions. The chairmen of the convention are Dean Wickson, Prof. Cook, C. C. Teague and J. W. Jeffrey.

The attendance is far greater than anticipated, and after turning many away from the Monday afternoon session, Dean Wickson who presided, announced that the Tuesday morning session would be held in Blanchard Hall. Dean Wickson called the assembly to order and spoke at some length along the general line of the need of more complete knowledge of soil physics and chemistry, and particularly impressed the truth that the recipe or formula that the farmer ordinarily seeks for every ill can never be given. The most that such a convention or any educational movement can give is a broadened mind and stronger grasp of the general principles underlying the general science of agriculture. The questions confronting the farmer are so complex that the following of a general "recipe" will lead to confusion and end in disaster. "Then let us during this entire week's program look for reasons for the greater principles which affect our industry, then with our best common sense learn the applications of these principles."

Dr. Wickson referred to soil conditions as of more importance than the aerial activities which are better understood, but the knowledge of the movements of air, of water, and of soil particles, is essential. It is no easy problem. In fact, it is one which must be solved by the physicist, the bacteriologist, and the chemist. He referred to these secrets as those of the great underworld of agriculture, and forcefully illustrated the comparison by referring to Dante and Virgil and their stories of life in the underworld. The Dante and Virgil characters had guides to show to them the mysteries of the lower regions. Guides are just as essential to show us the mysteries of the underworld of agriculture. The speaker said that the University of California had summoned two guides to show our growers these mysteries.

Dr. King is a conversational speaker and is not discomfited by asking of questions at any time. Some of the questions are not entirely relevant, but we believe, as a rule, they enable Dr. King to bring out most valuable points. He says that our problems in California are greater than those confronting the Eastern grower. The arid conditions of climate cause burning out of humus and necessitate greater attention to means of returning it to the soil. Especially is the clean cultural treatment against maintaining the proper physical condition of the soil. If productive power is to be maintained, some way must be devised to keep up the content of organic matter. Dr. King enforced the necessity for more water. He spoke of investigating some orchards which showed moisture only to a depth of two or three feet and below that the subsoil was so dry that the roots were unable to secure from it any material amount of soil moisture. One way to secure a greater quantity of water is to preserve the great waste of winter storm waters by shunting them into the lower gravel beds to be drawn out later for irrigation. Under present conditions more water escapes to the sea than is used.

But the Cultivator is going to press while the best of these talks are being delivered, and the meat from them will be used in later issues. It is a great embarrassment for a weekly paper not to be able to give full reports—as the daily can—but, as with the farmer, the Cultivator is gathering a fund of information which will be of inestimable value in the future.

JUDGES AT NATIONAL APPLE SHOW.

Five experts of recognized ability and continent-wide experience have been appointed by the board of trustees of the National Apple Show to pass official judgment on all exhibits and award cash prizes and premiums of a total value of $20,000 at the third annual exposition in Spokane, November 14 to 19. Professor H. E. Van Deman of Washington, D. C., is chief judge, his assistants being J. W. Murphy of Glenwood, Iowa, C. J. Sinsel of Boise, Idano, Professor S. A. Beach of Ames, Iowa, and J. Gibb of Kelowna, B. C. The judging will begin at noon on November 14.

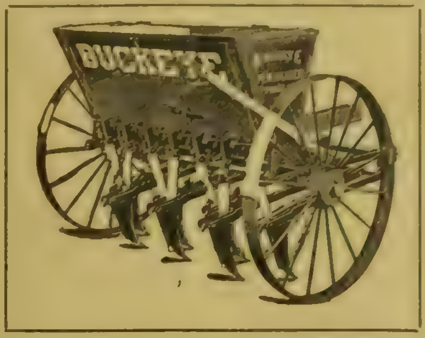
Pruning requires the most judgment of any operation connected with horticulture and should begin when the trees are ready to be set out. Before beginning to prune, study the shape of your tree and learn its natural inclinations and tendencies, so that you may do your work intelligently and overcome its shortcomings and failures.

Some orchardists in New England have heightened the color of fruit by the use of potash and Thomas phosphate powder, and it is likely that both these materials will tend to higher colored and higher flavored apples.

"Not twenty-five per cent of the trees set out return any profit to the man who sets them," declares an expert. Surely there is an encouraging hint in this for the skilful yet faint-hearted orchardist who fears an overproduction of fruit.

In removing large limbs, a good plan is to saw them off about three feet from the trunk to prevent splitting. Then saw again close to the trunk, so as not to leave a projecting stub.

For Use in Orange Groves and Vineyards
there is nothing better than the
Buckeye Fertilizer Drill
Set of Plates Furnished FREE with
Each New Drill if Desired
For Sowing Vetch and Peas



We have sold a great many carloads of these drills in Southern California and the Buckeye is now recognized by orange growers and fertilizer men as the best drill made for handling commercial fertilizer. Its low wheels, proper sized box, and large feed openings giving great capacity when desired, make it especially adapted to orchard use. This drill also made to successfully handle tankage.

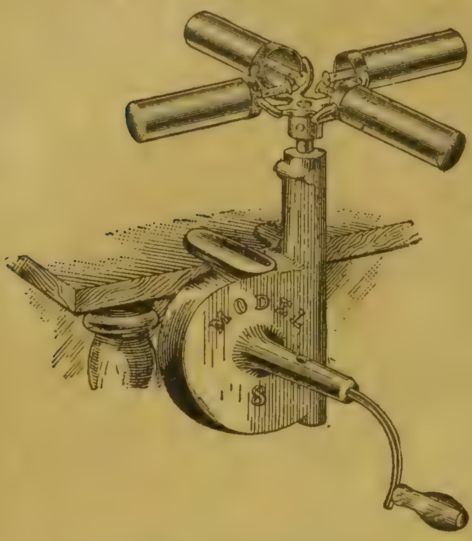
Improved Babcock Tester



Babcock's Milk Tester, an extremely simple, light, compact and carefully designed apparatus, especially adapted for use in the dairy and also on account of its light weight to the Traveling Dairy Inspector.

The working parts are entirely enclosed in a handsome cast-iron case, and consist of but two cut gears, namely, bronze spiral gear and steel spindle with worm thread.

The Tester is fitted with swinging pockets and malleable iron head; it turns very easily without any vibration or jar and can be readily attached for operation to any table or bench. The bottles are perfectly horizontal when rotating.

	Wt. lbs.	
No. 1, 2 bottle for milk	14 each	$5.00
No. 2, 4 bottle for milk,	14 each	6.00
No. 3, 2 bottle for milk, No. 4, 4 bottle for milk, and cream	14 each	5.50
No. 4 4 bottle for milk, and cream	15 each	7.00

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, pipette and test bottles.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

CALF TROUBLES.

By Mrs. M. E. Sherman.

When the calves are sick get them some new milk if you have to steal it from the separator man. I often find it requires good sitting down on the men to make them understand that racing on a cream check to make as much as possible each month may prove dear money. The calf from a registered cow sells for several times the price of a little new milk and when the case needs it, the new milk must go into the calf's stomach. Add to it the beaten whites of two eggs, one rennet tablet dissolved in one ounce of lime water, to each quart of new milk. If the calf still scours, add ten drops of formalin to the next dose of the milk. Give little and often until the calf is able to retain the milk. There are two things that are not safe to give a calf with scours, one is opium in any form, and boiled flour gruel. Both are sometimes recommended. We have used both and checked the diarrhoea with them and, also, killed the calf. We are unlike the medical profession in considering a case successful when the trouble stops but the patient is foolish enough to die. We wish the patient and the trouble both to get well.

Whiskey.

Sometimes a small tablespoonful of whiskey is added if the calf is weak and cold. A clean bed of hay with plenty of hay over the calf to keep it warm helps the little sufferer. Spray and clean up the surroundings carefully, using creolin in water, sponge off any filth on the calf and keep the baby sweet. Really it is a very safe practice to use rennet all the time in the separator milk. The tablets come in large boxes or they may be purchased in the ten cent form used for junket. One is dissolved in warm water and added to the milk at feeding time. If it is added too soon the calves will reject the curds and take only the whey part.

Separating.

When animals are sick remove the well ones but leave the sick ones just where they are. This seems a simple matter but nine out of ten people will remove a sick calf to nice new quarters and leave the well ones to take the trouble in the old quarters. This is a good way to infect new quarters with trouble. Conditions are certainly wrong when animals are sick, and to leave those that are not affected in diseased quarters is merely courting infection for them.

Abortion.

When cows are affected with contagious abortion in a herd there are always a certain number of calves that are dropped with scours. These calves have from the beginning of their lives a peculiar yellowish foul smelling diarrhoea. The place where they are stabled smells of fever. The calves are humped up and often breathe rapidly. Sometimes this trouble affects the joints and is called "joint ill" by the countryman. The same trouble may appear in colts and is cured in the same way. Few of the young animals among calves survive the fifth day. Those that do had better have gone, as they are stunted. These live along until they take cold and then usually die with pneumonia. Calves having this yellow or whitish yellow scours from birth are best mercifully disposed of at once.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Causes.

It was first called a stable disease as it was found that when cows calved in the meadows that there was little of this trouble. When it is necessary to have the cows calve in box stalls care must be taken that the stalls are in good sanitary condition. The walls and floor should be scraped clean and everything removed. Then wash the woodwork with good strong lye water, hot as possible. When it has dried off spray it with corrosive sublimate water and then coat the whole over with a good thick white wash. Put in plenty of clean bedding hauled in from the stack. When the calf is dropped, tie the cord with a cotton string dipped in a five per cent. creolin solution. Cut the cord three inches long and bathe it well in the creolin solution. Wipe it dry with a piece of gauze or with absorbent cotton and then cover it with collodion to which one per cent. of iodine has been added. If there is much of this trouble in a herd, it may be necessary to go further and disinfect the cows previous to their calving. This is done by using a douche of warm water containing two per cent of creolin every day for a week before they come in. Dairying or any animal industry is a series of little things done exactly at the right time. Time in every thing we human beings do seems to be of more account than anything else. The "meant-to" folks are always left behind in the march to success.

ANGORA GOATS.

H. H. Baker, Lower Lake, Cal.

I would like to tell a little story of our experience with Angora goats, and, in part at least, the experience of many others. What I have to say may be the means of putting hundreds like me on the right track.

We traded for a ranch consisting chiefly of rocks, hills, canyons, oak, chamisal, manzanita and the loveliest poison oak. One kind neighbor said, "Anything would starve to death on your place but a goat."

Goats, sure! of course, goats. We got a Government Bulletin on the "Angora Goat." Yes sir, in describing the kind of place a goat would select, if he had his choice, the author actually described our ranch in detail—must have been thinking of our place when he wrote it. We had it all, the brush, hills, rocks, canyons, water—everything, and then some.

We found where we could get the finest Angoras in the country; they come a little high and one of our local merchants, a good friend, tried to show us our error. Said we were foolish. He "could get us all the goats we wanted at $2.50 per head."

But we were obstinate. The California Cultivator said, "If you keep even a dog on the ranch keep a blooded dog." We got the registered goats in spite of the fact that our neighbor (a goat man) told us it wouldn't pay. "The hair was too fine, it would not weigh up with the coarse hair."

When we got our bunch it looked so pitifully small compared with the

AMERICAN SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only scientifically constructed ***Surface Irrigation Pipe*** on the market. No round seams to leak, retard the flow of the water, or weaken the pipe. Cheaper than flumes. Easily handled. ***Will last a lifetime. The correct way to irrigate alfalfa.*** We make Riveted Water Pipe and Tanks. ***Write for illustrated catalogue.***

AMERICAN STEEL PIPE & TANK COMPANY

349 Pacific Electric Building **Los Angeles, California**

bands of 1500 or 1600 that passed the gate, that hearing of some good grades for sale at $2.50 each, we bought about the same number of them.

After losing a few kids we still had an increase of over 100 per cent. In point of increase the grades had a little the better of it, every doe bringing a kid, and six bringing twins. Six good grade does that cost us $2.50 per head, $15.00, presented us with twelve kids. As the does had all been bred to a registered buck the kids were each worth more than the mothers, besides getting one clipping of mohair. All this within four months. What interest was this on the money invested?

But now comes the substantiation of the Cultivator's argument. We got our neighbor (the goat man) to come up and clip the goats, and he said he "never cut so much hair off so few goats;" that "it was so thick he could hardly shear it, it was like shearing a mat." In short we shipped it all to the factory in Lowell, Massachusetts, and when we got our returns, they told us the grade hair went 25 per cent medium fine, for which they allowed us 28 cents per pound. But the hair from the registered goats went 72 per cent medium fine, fine, and very fine. They wrote "this is all good stuff, and we have allowed you 40 cents for the medium fine, and 60 cents for the fine and very fine."

In conclusion, when we began we picked out the toughest, most bushy 25 acres we had, fenced it and turned the goats in. When they began on it there were parts a rabbit could hardly penetrate. Six months later they had made a park of it, cleared up that worthless brush, bringing it down to the farmyard corral in the shape of the finest kind of fertilizer, giving the grass a chance to grow in place of the brush, making it better pasture for other stock and the only expense to us, a little salt, and a few old sheds to get under when it was stormy. No doubt there is money in the hog and the sheep, but not on this ranch, and there are countless thousands of acres just like ours in California.

As soon as our goats cleared up the first patch we repeated the dose, fenced the next worst patch and so on. We are getting this ranch to look like something now—keep fencing more pastures with woven wire, straightening up the buildings and hauling out loads and loads of manure from the corral and putting it on the few acres of farming land, and the garden. We are making arrangements to purchase the adjoining 160 acres, and it is the goats that did it. They tell me in parts of the Orient a man's standing in society is determined by the number of Angoras he owns and I am not surprised at the information. Long live the goat. May his shadow never be less.

THE PERCHERON.

From Plumb's "Types and Breeds of Farm Animals" we take the following:

The more approved type of Percheron today calls for all the best features in the model draft horse. In weight mature stallions usually average from 1700 to 2000 pounds, and mares from 1500 to 1800 pounds. Exceptions, however, very naturally occur. Univers 33977 P. R., the celebrated show stallion, weighed in show form about 2300 pounds, while Chichi 40072 P. R., as a two-year-old in show form, weighed 2150 pounds. A most approved weight of mature mare is 1650 pounds. The height of stallions ranges from 15½ to 17 hands, and mares from 15½ to 16½. Tall Percherons are not regarded with favor, a lower set form being preferable. The color is usually a gray or black, but bays and browns occasionally occur. Fashion has caused some change in color production, there having been periods when grays were most common, while later blacks were much in favor. It is said that at the fair at Chartes, France, in February, 1877, one dealer had eighteen blacks, for which he asked about the equivalent of $10,000 for the lot, "and they were well worth it." Grays have been most popular in the United States and France, and dark gray may be regarded as a typical Percheron color. However, in spite of the criticism of black as a horse color, the opening years of the twentieth century have seen a great demand for black Percherons or dark iron grays, and most of the horses recently imported have been of these colors.

The body of the Percheron is characteristically compact and blocky of form, full in the chest and broad of back. Horses of the breed, however, often have steep, rather short rumps, with the tail set too low, and even with the best specimens the type of rump tends to unnecessary slope. In depth and fulness of body there is also a lack. The legs and feet are quite distinctive of the breed. No more shapely and well developed feet are found on any draft horse than on the Percheron. The bone of the leg is usually superior, but the cannons are not infrequently lacking in breadth and flatness, while the hocks may be fuller than is desirable. The clean limbs, free of long hair, account for much of the popularity of the Percheron in America. Percheron action at a walk is reasonably true and snappy. The trot, with good representatives of the breed, is carried with vim and life, the knees being moved strong and the hocks well flexed. The Percheron head and neck are typical of the most attractive draft-horse character. The eye is usually full and prominent, the forehead broad and reasonably full, the face straight or slightly dished above the nose, the jaw strong, the ears refined and attractively set and carried with animation. The graceful neck is usually blended with the body and cleanly attached to the head, being crowned with profuse mane and foretop. Those things which give special distinction to the Percheron breed are the head and neck suggesting the Arabian, the blocky body and droopy tendency of rump, the short smooth legs, the characteristic color, and the superior action. As a draft beast the pure-bred or high-grade Percheron ranks in France and America at the very front, with no superior.

A GROUP OF STANDARD BRED PERCHERON HORSES.
Owned by J. Crouch & Son.

Chairman A. G. Schulz of the fair committee of the various boards of trade of the Central California orange district, has issued a call for a meeting at Visalia to consider the details of the citrus fair which is this year to be held in the county seat. On this committee there are two representatives each from Porterville, Visalia, Dinuba, Exeter and Lindsay.

DE LAVAL
Cream Separators
Won First Prize
at the
California State Fair
held at Sacramento, Sept. 3 to 10, 1910.

The DE LAVAL machines were exhibited in competition with the half a dozen other makes and, as usual, the DE LAVAL carried off the honors, being awarded the first premium.

Wherever they have been exhibited DE LAVAL Cream Separators have invariably been awarded highest honors at every important exposition or actual-use contest.

The DE LAVAL skims closer, runs easier, lasts longer and is easier to keep clean than any other separator made.

Sooner or later you will buy a DE LAVAL.

Plant Bulbs Now!

Right now is the time to plant flowering bulbs. In the hot house they will flower for Christmas. In the window box or garden they will be ready to blossom in the early spring. Plant a few bulbs in your garden now and you will have a profusion of most beautifully colored and most fragrant of flowers, a typical California garden.

We carry the best of imported bulbs from Holland, France, Japan, China. They are grown especially for us and are strong, hardy, prolific flower bearers.

Morse Special Assortment

consisting of 130 of our best selected bulbs assorted as follows:

6 Named Hyacinths, assorted
15 Trumpet Daffodils
15 Long Stem Tulips, mixed
20 Spanish Iris, mixed colors
20 Crocus, mixed
12 Hyacinths, all colors
6 Double Daffodils, Von Scion
12 Jonquils, Campernele
12 Freesias
12 Snowdrops, Giants

130 Bulbs in all, for $2.10. (By mail 40c extra.)

Our beautifully illustrated bulb catalog, illustrating and describing all our bulbs and seeds for fall planting, sent free to any address.

The Ornamental Garden

FREE ORNAMENTAL PLANTS.

In the interest of new plant introductions, the Bureau of Plant Industry of the Federal Department of Agriculture at Washington has now ready for experimental planting the following list of little known ornamentals:

Ipomoea fuchsioides. 20895. A tuberous morning-glory, indigenous to South Florida. It is of vigorous growth and covered for a large part of the year with brilliant carmine colored blooms.

Dendrocalamus strictus. 21548. A very useful and strong growing bamboo of India, attaining a height of 100 feet, occasionally forming forests. This species does not die down after flowering as do other bamboos. It endures cold, as well as dry heat, and is useful for the protection of embankments on account of its fibrous roots.

A POMONA VALLEY GUARDIAN

Clematis recta mandshurica. 22620. An ornamental, herbaceous perennial, 2 to 3 feet high, indigenous to China.

Astrapaea wallichi. 19897. An ornamental tree introduced from Madeira, having large pendant clusters of pink flowers.

Passiflora edulis. 25874. A climber indigenous to Brazil, producing an edible fruit.

Echium fastuosum. 26190. A shrub indigenous to the Canary Islands, cultivated in California for its ornamental value.

Heeria elegans. 7688. A trailing plant indigenous to Southern Mexico; suitable for hanging baskets and rockeries.

Jasminum nitidum. 7342.

Cyphomandra betacea. 25515. This species is an herbaceous shrub, indigenous to the mountain regions of Brazil, adjacent to Peru. The fruit is egg-shaped, about 2 inches long, with a tomato-like flavor. .

Macadamia ternifolia. 25845. A nut bearing tree from Australia, about as hardy as the orange. It is evergreen, and under favorable circumstances attains a height of 60 feet.

Olea foveolata. 25846. A tall shrub, indigenous to South Africa.

Quercus dentata. 26945. An oak, indigenous to parts of China, Korea and Japan. This is one of the species on which the oak-silkworm feeds.

Feijoa sellowiana. 26120. This dark evergreen shrub is indigenous to Argentine. In hardiness it about equals the orange. The fruit is green, tomentose and averaging 1 inch in diameter; it is very delicately flavored.' It succeeds well in California.

Pinus armandi. 27046. A dwarf pine from Western China.

Lonicera pileata. 27047. An ornamental, suitable for rockeries and shrubberies.

Caesalpinia nuga. 25803. An attractive, sweet scented, flowering scandent shrub, indigenous to the Philippines.

Bambos arundinacea. 27490. A bamboo, indigenous to India. This species attains a height of 30 to 45 feet, and being extremely spiny, makes an admirable living hedge, impenetrable by man or beast. It succeeds well on moist, rich soils, particularly on river banks. The seeds are used in India as food for poultry.

Juniperus pachyphlaea. 24624. A tree sometimes attaining a height of 60 feet, indigenous to the arid Southwest at elevations of 4000 to 6000 feet.

Greigia sphacelata. 24207.

Eucalyptus microtheca. 23495. Indigenous to Australia; a tree attaining a height of 150 feet under favorable conditions. Successfully resists frosts above 18 degrees Fahrenheit. Requires well drained soil and is well adapted for desert regions. The timber is particularly useful for piles, bridges and railway sleepers.

Panicum divaricatum. 24879.

Amygdalus nana. 24809. A dwarf almond from Turkestan.

Pinus peuce. 24338. An ornamental hardy pine of dense, regular habits and slow growth. Native to Southeastern Europe. Attains a height of 50 feet.

Phyllanthus acida. 23472. A small, very ornamental tree, indigenous to India and Madagascar, belonging to the family Euphorbiaceae. The fruit is produced in great abundance, and may be used in the manufacture of pickles or preserves. In hardiness the plant equals the mango and avocado.

Ruscus aculeatus. 22429. An erect liliaceous shrub, suitable for garden hedges; native of the Mediterranean countries, Central Europe and Southwestern Asia. The young shoots are edible.

Chionanthus retusa. 21617. Indigenous to China. A deciduous tree with Rhamnus-like leaves. In spring it bears white fringed, fragrant flowers, followed in the fall by masses of blue berries.

STREET-TREE LITTER.

There are those who profess to dislike all street trees because even the cleanest of them drop an occasional leaf. Seeing that every leaf on every tree eventually falls it is hard to see how we shall satisfy such unreasonable mortals and yet beautify our streets. Under some conditions a litter of leaves, especially small or finely-cut leaves, is somewhat desirable. A letter from Tree Warden Reed of Riverside, just to hand, says:

"This matter of litter from park and street trees is much complained about by some. But my gracious! do you know of anything worth having that doesn't cost something? The pepper is complained of as being a dirty tree, but the litter from it cannot be called dirty litter. True, it needs to be cleared from cement pavements and lawns, but if the parking space is not in grass or flowers and is level and free from weeds, the coating of fine pepper leaves, especially when thickly strewn with the red berries is, to my eye, a most ornamental carpeting. I have no patience with the careful sweeping of it up, leaving the bare ground exposed. If you are like-minded, I wish you would call attention to this sometimes, for the litter from the pepper is no more dirty than the carpet of needles in the pine woods. Also please call attention to the fact that lawns may be grown under pepper trees. They require a little more manure but that is compensated for by the protecting shade during hot weather. Some of our handsomest lawns are under pepper trees."—L. A. Times.

Garden and Field Crops

SELECTION OF SEED POTATOES.

OF ALL the factors in potato growing, selection of seed is by far the most important. Some twelve years ago the writer undertook to improve and develop a potato along the same lines that he follows in improving his Shropshire sheep and Shorthorn cattle, using the best method of selection and giving the seed plat the best possible cultivation and irrigation in order to obtain uniformity of product. Since that time he has been selecting seed potatoes of the size and type which he wants to produce. As a 12-ounce potato is about ideal in size, seed potatoes of that size were selected from the bin in the spring and then 4 or 5 acres were planted in a special plat for seed, to be used for the main crop the following year. This plan was followed for twelve years with a potato (the Perfect Peachblow) which it was said would degenerate and ultimately run out; but that potato continued to improve during all that time.

Three years ago Prof. E. R. Bennett, a specialist in potato work from the East, came to our state agricultural college. He became interested in the work the writer was doing and freely complimented him on his success in potato production; but he wanted to take up and further improve the stock. Out of specially selected seed he selected perfect tubers and planted them in a field by themselves, and when the potatoes were ready to harvest we dug all of them by hand and kept the product of each hill separate. All hills that did not have 20 tubers of uniform size, without knot, crack, or rough end were discarded. No hill was selected unless it came within these requirements, and surprisingly few hills were found which passed muster. Enough were selected, however, to make about 200 pounds, and these were planted the following spring. When harvested it was a most marvelous row of potatoes. By pursuing this method it is hoped soon to have a potato that will make 25 perfect tubers to the hill.

Had we bred our Shorthorn cattle as we have been in the habit of selecting and breeding our seed potatoes, we would now have no breed of Shorthorns. If we used only the culls and scrubs to breed from, our breeds of stock would soon run out. These breeds have been brought to their present standard by selecting the best on scientific principles of breeding. One reason why potatoes have degenerated in the past is that the potato growers of the United States have planted their culls and screenings under the erroneous impression that such methods in seed selection would produce as good results as any other.

In selecting potatoes in the field, considerable dependence can be placed on the appearance of the tops. A large perfect top, with several stems of good shape and size, can be depended upon to have more tubers under it, and of more uniform quality and size, than a hill with a single stalk or one with small weak stems.

One of the essential and most important factors for success in this industry is the selection of perfect seed stock from the hill, in much the same way as seed corn is selected in the field from the best individual stalks. There is no other way to get true breed characteristics in potatoes except by selecting seed from the perfect hill, and seed should be saved only from hills producing a first-class marketable potato in the growing of which there is no waste of plant food. No manufacturer in this day of economy could stand the loss entailed by methods of manufacture under which he was compelled to cull out and throw in the scrap pile 20 per cent of his product as waste, and no one can expect the highest success in potato culture who adopts methods resulting in a loss of 20 to 60 per cent of his crop in culls and unmarketable potatoes. But this is what the potato growers of the United States are doing today.—Bulletin 386 U. S. Dept. Ag.

THE CROP FROM THIS MELON FIELD AT TURLOCK SOLD FOR $2,000
Courtesy Turlock Journal.

HAVE PLENTY OF PARSLEY.

There is no prettier or more useful addition to the garden border than the common ruffled parsley. The curled varieties of low growth are quite beautiful enough for bouquet green, as well as for garnishing. For out-of-door sowing the seed should be prepared by soaking in hot water for twenty-four hours in a warm place. Sow thickly in rows, one foot apart and a half inch deep, pressing down well with a smooth board, after sowing. It lives through the winter and will spring up a second summer if care is taken to cut back the flower stalks and to prevent it from going to seed. A few sprigs of parsley give an attractive appearance to even a platter of cold boiled beef or mutton, while a mound of well browned, carefully seasoned hash crowned with a sprig of the same dainty green, looks the aristocrat of breakfast dishes. Aside from its value as a garnish and seasoning plant, it is an approved tonic and clearer of the complexion. A sprig of parsley with a dash of salt eaten after indulgence in onions will entirely remove the disagreeable odor from the breath.—Coleman's Rural.

Everything looks favorable for the Escondido fair being one of the greatest attractions of Southern California. this year. From all parts Secretary Carroll is getting inquiries for space in which to make exhibits and especially is this true concerning live stock. It is almost certain that the exhibit of horses, cattle, hogs and sheep will be one of the largest ever given in California.

THE CORK OAK OF COMMERCE, Cover.
RENOVATING THE ORANGE TREE BY SYSTEMATIC PRUNING, 315.
CITRUS AND TROPICAL.—Whitefly Enemies of the Citrus; Whitefly Invasion; Beginning of California Orange Industry; Hawaiian Pineapple; Exterminating Thrips; Navel in History; 316, 317.
TREE AND SHRUB FRUITS.—Responsibility of Nurserymen; Tillage of Small Fruits; Soil Convention; Valencia Raisin Crop Short; Judges of National Apple Show: 318, 319.
LIVE STOCK AND DAIRY.—Calf Troubles; Angora Goats; Percherons: 320, 321.
ORNAMENTAL GARDEN.—Free Ornamental Plants; Street Tree Litter: 322.
GARDEN AND FIELD CROPS.—Selection of Seed Potatoes; Have Plenty of Parsley: 323.
EDITORIAL.—Value of Scientific Work; Dry Farming Congress; Accomplishing Results; The Auto and the Farmer; Reforming Through Agriculture; Oxnard Sugar Factory: 324.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast: 325.
PRACTICAL POULTRY CULTURE.—Breeding Barred Rocks; The Hen and the Farmer; Cackles and Crows; Feeding Green Bone; Chicken Manure on Garden; Cure for Gapes; Fall Aphorisms; Fighting Vermin: 326, 327.
BEES.—Management of Bees; Hives: 328.
GENERAL AGRICULTURE.—Talk and Productions Meet; New Mexico Range Caterpillar; Parcels Post: 329
QUERIES AND REPLIES.—Red Spider; Best Apple; Walnuts; Fruit in Arizona; Pecans; Crown Root Borer; Red Spider on Beans; Developing Heifers; Soft Brown Scale: 330, 331.
HOUSEHOLD.—Good-night Kiss; Henny Penny; Good Recipes; Washing Knitted Goods; What We Need: 332, 333.
PRODUCE MARKETS.—Los Angeles Market, San Francisco Market; Deciduous Market, Citrus Market: 334, 335.

Value of Scientific Work.

We doubt not the Pajaro Valley can show the greatest amount of consistent effort to subdue a pest affecting fruit trees of any fruit growing section in the world. Beginning in 1903 the apple growers determined to make a concerted effort to control the codling moth which had very materially lessened the output and still more lowered the grade of their fruit. Spraying with Paris green had been done prior to that but to a most unsatisfactory end, both in that it did not accomplish results and besides had injured the trees. The work was taken up by the apple growers association and the aid of experts of the state university asked. The university at that time had no scientific investigators, but under the direction of Prof. Woodworth students were put in charge and the work of investigation began. The first year, that is 1903, less than ten per cent. of the orchards were sprayed. During the next two years 33 per cent of the total acreage was treated. At that time, however, the injury to the orchards and to the vitality of the trees became so apparent that for a few years even less than 33 per cent was sprayed.

Chemists were put to work and practical orchardists experimented, and ultimately an ortho compound was produced which accomplished even better results with the codling moth and left the trees unharmed. This gave such an impetus to the work that in 1908 nearly one-half of the orchards were sprayed. In 1909 over 80 per cent, and the present year 95 per cent, or practically all of the orchards, have been treated. Unfortunately, according to the report of Horticultural Commissioner Volck, a few trees have been injured this year by the use of an arsenate which in itself was probably a good article but was unsuitable to Pajaro Valley conditions and proved injurious to a number of orchards, comprising however, less than one-fourth of the acreage of the Valley. As an indication of the magnitude of spraying operations in that Valley may be mentioned the fact that over 100 tons of arsenates were used.

Dry Farming Congress.

This is the week of the Dry Farming Congress in Spokane. It was formally opened by the pressing of a golden key closing the electric connection by President Taft at Beverly, Massachusetts, on Monday. Governors from several western states and representatives of six foreign nations, together with heads of many federal and state departments and experts from all parts of the country, are discussing what to do with the five billion acres of land in this and foreign countries which require dry farming methods. It is said that those attending represent fully the above mentioned acres. A semi-arid dry-farming exposition is being held in connection with the congress, at which prizes aggregating $10,000 are being offered.

Accomplishing Results.

California has occasion to feel somewhat restive under the work of the Department of Agriculture in furtherance of the Pure Food and Drug Act, especially with reference to the sulphur question. This office is almost daily reminded of other work by the Department under that act which is, we believe, most beneficial to agriculture. A large number of leaflets are issued reporting decisions and judgments showing that honesty will prove the best policy for those who are putting foods on the market.

For instance, we note Leaflet No. 525 refers to a judgment rendered against a certain wholesaler for selling milk which consisted in part "of a filthy, decomposed and putrid animal and vegetable substance." Another judgment was for selling adulterated preserved "whole egg." Others were for representing cod fish strips to be a foreign product whereas they were produced in America, and disposing of "choice evaporated apples" which had been soaked with water and contained quantities of core and seeds and other refuse to increase their weight. Cream and milk containing formaldehyde have been condemned, as have many cases of tomatoes and other canned goods because several ounces under weight given on labels.

These decisions are claimed to be one reason for the higher cost of living, but we do not believe such is the case, for ultimately the purer goods sold will more than offset any apparent low price for adulterated and inferior products.

The Auto and the Farmer.

The Rural New Yorker speaks of the automobile changing the character of meetings of fruit growers and farmers. As it says, formerly these meetings were pretty well tied down to one spot, the field covered being of very small radius. Now the radius is immensely increased and more elaborate programs with more representative speakers are made possible, and the attendance is vastly greater.

We believe that California farmers will not need to be influenced by action similar to that taken by Kansas bankers in deciding to discourage loaning of money on mortgages for the purchase of automobiles. California farmers, as a rule, are capable of deciding such questions for themselves. We do not think mortgaging to any extent is being done in this State for this purpose.

Stanford University specialists are taking up the question of poisoning through eating sulphured fruits, and will experiment on a bunch of twenty students who have submitted themselves to "poisoning." They are to be fed indefinitely on fruits dried by the sulphur process. That is, this fruit is to be made a large part of this diet. Each week they will undergo a thorough physical examination and comparison will be made with their condition at the beginning of the test. A similar experiment was performed last year at the University of California and this, we doubt not, will be used as a check on the former one.

Prof. C. W. Woodworth of the State University, is making investigations in the citrus orchards of Southern California as to the leakage of tents used in fumigation. This leakage has proved one of the most serious factors to be considered in the matter of effective fumigation, though material advance has been made by the adoption of the suggestion of Mr. Woglum that a tent of tighter weave be used, but at best there is great loss of material and effectiveness through leakage. It is to be hoped that Prof. Woodworth's work will lead to determining some method of preventing or greatly reducing this loss.

Advices from correspondents in Arizona indicate a medium crop of oranges which will run a large percentage fancy and all of good quality. Packing houses will open about November 10th to 15th.

The olive crop in the Salt River Valley of Arizona will not be up to the average, in fact, will be almost a failure on account of the dry spell of the past summer. Arizona rains come in the summer time, and drouth this year combined with the extra hot weather has resulted in premature ripening, over ten per cent. of the fruit being ripe already and dropping off. This means the olives will be valueless for pickling; we are not informed as to their oil qualities.

Too much stress cannot be put upon the value and importance of live stock in keeping up favorable soil conditions, as no country now known has been continuously successful in crop production without the use of manures from the feeding of forage and grain crops.

Reforming Through Agriculture.

Intensive French gardening is being used in certain reformatory schools in England. It has been found that the young fellows sent to the reformatory for stealing or petty crimes, raised in cities where they never knew of the first principles of agriculture, take to the gardening proposition far quicker and with more interest than was imagined at the start by the friends of the scheme.

We note in a clipping from the Daily Mail sent to us by Mr. Edward Berwick that these gardens have been established in many schools. One patch of less than an acre produced eighty-five pounds ($413.10) worth of products last year, thus giving to the boys not only education but money profit. Another school on a more pretentious basis which has 100 boys, has 100 acres of land handled in a larger way than the intensive garden plat. It is planted to orchard and small fruits and a portion of the land is given over to general farming. The school gives, of course, in addition instruction in carpentering, cabinet making and other trades. Almost invariably these boys take hold of this work and leave the school fitted to be citizens instead of criminals; many who were formerly a burden and expense because of their criminal proclivitives, graduate from the schools to the farms of England and Wales and help to advance the welfare of the country.

Oxnard Sugar Factory.

We regret that the view of the Oxnard Sugar Factory which appeared on first page of last week's Cultivator was not credited to the Oxnard Courier, which paper extended to us the courtesy of the use of the engraving. The Courier has shown much enterprise in advancing the interests of Oxnard and vicinity.

With scientific knowledge which can be acquired by experiments in supplying perfectly balanced plant food and maintaining soil fertility, the scientific principles of which are similar to those used by every successful breeder in feeding and fitting prize-winning stock; and with the proper proportions of plant food—phosphates, nitrogen and potash—in the soil as found in many parts of the West; and by the use of clover and alfalfa, there is no reason for those who contemplate engaging in the potato industry to fear the outcome.

Of making of associations organizations or congresses to advance various interests there seems to be no end. Most of them have a good object in view and should be encouraged. One of the latest is one to discourage the pasturing of hogs in fields or corrals with cattle. The hog is very susceptible to tuberculosis and the ease with which the disease is conveyed from cattle to hogs is causing the agitation.

The article on fumigation in last week's Cultivator was written by Prof. H. J. Quayle of the state experiment station force located at Whittier. Prof. Quayle is carrying on an extended series of experiments to determine the leakage of tents and other features connected with fumigation. The article in question was from an address delivered before the Covina Farmers' Club, which fact should have been stated when the article appeared.

The good roads propaganda is preached everywhere nowadays; the advisability of having good roads is no longer debated. States and counties now consider methods somewhat critically but they are united on the main proposition. Eighteen years ago it was an entirely different matter.

The apple show where apples grow is on the boards at Watsonville next week.

Agricultural News Notes of the Pacific Coast

Northern California

On September 23, W. T. Boulware of Biggs closed a deal with F. M. Turner of Bangor, Butte county, for the sale of his Bangor ranch for $11,220. This property consists of 1,020 acres of land and most of which can be irrigated.

Farmers in Shasta county are finding the "dipping cure" effective in eradicating hog cholera. After losing several head, Joseph Hunt, Jr., dipped his remaining hogs and stamped the disease out completely. Other farmers report the same results.

As an experimental shipment for Australia, Hunt, Hatch & Co. of Sebastopol, have packed seven dry goods boxes with apples. The fruit was packed between layers of sawdust. If the idea proves successful the freight charges will be very much reduced.

Having no faith in banks R. L. Boggs of Red Bluff, secreted $550 in currency and $500 in gold about his home. Fire destroyed the dwelling yesterday. Mr. Boggs has recovered four $20 pieces, melted together. Sometimes banks are better than hiding money away.

L. L. Russell, a recent settler near Biggs, has built a sorghum mill to crush over an acre of sugar cane. The crop of cane presents a most encouraging stand. Mr. Russell has a modern evaporating pan and expects to make a large quantity of syrup this year.

A. J. Pieters, of the Pieters-Wheeler Seed Co. of Hollister, left recently for Ann Arbor, Mich., where he will fill the chair of botany in the University of Michigan. Mr. Pieters has been connected with the California seed growing industry for several years and is thoroughly versed in all its branches.

The Lodi Sentinel says that the co-operative winery at that place will crush about 20,000 tons of grapes this year. Sugar test alone will be the basis for prices this year, and grapes that do not come up to 18 per cent will be refused. At the present price of wine the shareholders will have received, when the wine is sold, a total of $13.50 per ton, less the cost of operation.

The Italian Swiss Colony of Santa Rosa, has not yet abandoned its fight for the exclusive use of the word "Tipo" on its wines. The company has made a name for this wine they have put on the market, and recently the Supreme Court decided that any company had a right to use the name, as it was merely the Italian word for type or kind. The Italian Swiss Colony has asked for a re-hearing of the case.

As showing the importance of the Watsonville apple industry the Register says that there are more than 3000 people engaged in the packing business and the pay roll is almost $200,000 per month. From reliable information it is learned that the 2391 males draw an average of $2.25 per diem, which makes the pay-roll for men each day $5379.75. The 698 females are paid an average of $1.33 per day, or a total per day of $923.34. The total money paid per day is $6308.09. On this basis the monthly payroll is $198,242.70.

Mr. George C. Roeding, president of the Fancher Creek Nurseries of Fresno, has made arrangements with G. W. Pierce of Davis for 100 acres of choice land on which he will establish a deciduous fruit nursery. Its adaptability to this industry can scarcely be overestimated. Mr. Roeding will work harmoniously with Mr. O. W. Sanders, who is handling a fifty acre tract of the Pierce land and has been eminently successful along similar lines. Mr. Roeding enjoys a state-wide reputation as one of the leading nurserymen of the state.

Central California

A solid shaft of sôil, twenty-five feet in height and eighteen inches in diameter, is to be used by the people of the Linden section as an object lesson of the character of the land there.

The Lindsay Fruit Association held their annual meeting September 17. The following board of directors was elected: H. C. Morrison, G. V. Reed, G. H. Merrifield, J. H. Turner, H. C. Morrison was elected president; G. V. Reed, vice president; and Rob Eddy, secretary.

Harry Quinn of Delano recently made a shipment of some of his thoroughbred Spanish Merino rams. There were thirty-five fine animals in the lot which were sent to Placer county. Mr. Quinn raises large numbers of these fine animals each year, for which he finds a ready market.

A large lot of Watsonville Newtown Pippins sold in London recently at the rate of $2.88 per box, which is a very fair price. Manager White, of the Earl Fruit Company, reports a car of four-tier apples sold at $2.88 per box, while a car of four and one-half tier sold for $2.40 per box in the same market at about the same time.

The Dinuba Farmers' Union Packing Company has just installed and started operating a raisin drier which is sure to be a great boon to the members and growers generally. The new drier is operated by steam and has a capacity of 40 tons every twenty-four hours. Raisins are dried in six hours from the time the trays are run into the house.

The annual meeting of the Central California Citrus Exchange was held September 15. The following directors were elected: D. G. Overall, G. S. Berry, F. F. Hostetter, L. S. White and H. C. Morrison. Mr. Overall was elected president; F. F. Hostetter, vice president; C. H. Grassly, secretary and manager, and the First National Bank, treasurer.

Official headquarters of the Kern National Forest, embracing 85 townships, or 3600 square miles, with a total of nearly 2,100,000 acres, lying partly in Kern and partly in Inyo county, has been opened in Bakersfield. The Kern National Forest is a part of the Sequoia National Forest and was formed July 1, 1910, by proclamation of President Taft.

Among the various profitable industries of Tulare county is the raising of hogs. Recently S. O. Walker sold fifty-four head of hogs for the total sum of $1042.92. Mr. Walker has hit upon the scheme of feeding his hogs soaked barley, and from the time he purchased his hogs until he sold them, they gained at the rate of two pounds per day on that diet.

The receipts from the late state fair are estimated at $51,000, of which amount approximately $32,000 goes to the Fiesta of the Dawn of Gold committee, as against an expense list for the committee aggregating about $60,000—the deficit to be made up by a pro rata draft upon the $70,000 guarantee fund subscribed by a number of the leading business interests and civic organizations of Sacramento.

One would suppose that the pear blight had put the production of that fruit out of business, but if we are to believe The Hanford Sentinel, pears are still quite an item of production in Kings county. During the past two years the trees that were not totally destroyed by the blight have taken on new vigor, and this season the crop of pears has been good. The Klein Fruit Company of Los Angeles has shipped from Armona ten carloads of the fruit, green, and it is said that had their buyers known where to go for the fruit, twice that amount could have been secured.

Southern California

The cotton gin erected at Durbrow by the Coachella Cotton Company is completed. The machinery is in the building and ready for inspection. This is a two-stand gin with 70-inch saws.

Howard & Smith, Los Angeles, have been granted a patent on cement pots and it is stated that these pots have proved a success, especially in the large sizes, 9-inch to 24-inch.

R. M. Cartwright of San Luis Obispo has recently purchased the pure bred imported Saanen buck goat, Andreas Hofer. He stands thirty-eight inches at shoulder and has a great record as a dairy sire.

United States Entomologist Wildemuth, located in the Imperial valley, stated that the alfalfa worm which is causing the growers much trouble is rapidly dying off, due to the bacterial disease which is attacking the worms.

There are about 12,000 acres of limas on the mesa lands between Los Angeles and the ocean, as compared with 10,000 last year. Early threshing will be the rule this season as the growers were caught last fall by the early showers.

The Rialto Orange Company has just distributed among its members the returns of the first July pool of Mediterranean Sweets, amounting to some $35,000. The "Orchard Run" in this pool paid the growers $2.42 net per box, and the "Standards" $1.67 net per box.

The annual meeting of the stockholders of the Rialto Orange-Lemon association was held September 15. A new board of directors was chosen which elected the following officers: Thomas Moffatt, president; George A. Brua, vice-president; W. H. Glasscock, secretary.

Extensive experiments are being made in fumigation outfits in Orange county by the Department of Entomology of the University of California. The tests will be in regard to the leakage of fumigation tents and the effectiveness of hydro-cyanic gas in different kinds of weather.

The present bean crop, in the Santa Maria section is undoubtedly the best it has seen. It is now being harvested, and everything looks good except possibly the price for the disposal of the crop. There is also an abundance of hay, and prices are moderate. Some of the ranchers are holding their supply for an advance.

The Golden State Canning Company of Ontario, finished up work on peaches September 23. The place will not close down but begin work at once on tomatoes and put up some thing like 20,000 cases. Manager McCann of the cannery states that last year and this where growers irrigated their crops they harvested big yields. The cannery people pay $8 per ton.

The Whittier Citrus Growers' Association is jubilant over the prospects for the coming year. There is an expected increase of 75 per cent. in the output from Southern California this season. The association numbers 175 members, and controls about 647 acres of orange and lemon lands. This year in the neighborhood of [illegible] carloads of oranges and lemons will be marketed.

The foot hill orange growers have organized the Cucamonga Foothill Orange Association. The directors chosen are: Messrs. P. A. Demens, J. Dederich, E. Gcerlitz, A. J. Ledig and W. C. Belden. P. A. Demens was elected president, J. Dederichs, vice-president, and W. C. Belden, secretary. The association has made a contract with the Redlands Mutual Orange Distributers to handle the fruit for the coming season and work on a packing house has already begun.

The Coast

Farmers and fruit-growers of Washington State have organized a society for the purpose of importing labor to help them save the crops.

A large tract of land has been purchased near Kirkland, Wash., by J. J. Bonnell of Seattle, Wash. He intended to put up a range of about 20,000 square feet of glass.

The big government cement-mill, which has been in operation for five years at Roosevelt, Ariz., making cement for irrigation works, has fulfilled its mission and is being torn down.

The Texas Citrus Fruit Growers' Association accepted the invitation of the State Horticultural Society of Florida to attend the meeting of that society in Tampa, January 31.

Fall seeding has begun in the Palouse Valley in Washington. Despite the dry weather and the fact that the ground is dry and dusty a number of farmers have started seeders, and are "dusting in" their fall wheat.

In Montana, road experts have found that crude sugar-beet syrup sprinkled over dirt roads that were dusty, makes the surface impervious to rain and two coats a year will keep the road in first-class condition and at very low cost.

Ross Magnus, a man 80 years of age, rode from Virginia to Colorado on horseback to locate a farm on government land. He carried a roll of $5,000 in currency in his boot-[illegible] and after selecting his farm, paid all of the fees at one time.

One hundred and twenty thousand one and two-year-old apple trees of standard varieties will be planted on 1,500 acres of land in the foothills near Waverly and Fairfield, Wash., next spring by the Commercial Orchard Company of Washington, organized in Spokane with a paid up capital of $100,000.

A press dispatch from Tacoma, Wash., says that 200 carloads of apples were blown from the trees in Yakima valley September 15 by a terrific windstorm. Many trees were uprooted, while others were badly damaged. Much of the fruit being ripe or nearly so, can be utilized for vinegar and cider manufacture.

What to do with this year's fruit crop in the immediate vicinity of Pendleton and along the Umatilla river in Oregon, is a problem that now confronts the growers of that section. It is estimated that there are 100 carloads of apples alone which will soon be ready for market. Organize an exchange, and follow in the wake of the California orange growers.

The chairman of the Australian Water Supply Commission is in Europe trying to secure 2,000 British, Italian, and Danish farmers, who understand irrigation, to settle on 2,000 farms in northern Victoria. Mr. Elwood Mead, a well-known irrigation expert, formerly residing in the United States, is chairman of this commission, and through his efforts large tracts of hitherto unprofitable desert lands in Australia have been reclaimed.

Ranchers in the Yuma Valley have demonstrated that alfalfa seed for market is a profitable crop. F. E. Elliott, one of the seed producers, returned recently from a trip to San Francisco and Los Angeles, bringing with him orders for three carloads of alfalfa seed, or 90,000 pounds, at fourteen cents per pound. He has also received from Kansas City an order for five carloads at fifteen cents per pound. Alfalfa is producing from 500 to 800 pounds of seed to the acre in Yuma Valley, and in addition to the seed cutting the fields produce five to six cuttings for hay.

Mammoth Hatchery

We are the great poultry Emporium in the West. We sell only the very best, at prices that will bring your orders right along.

1500 to 2000 Splendid Pullets and Laying Hens

in our yards and orchards every day. Finest and largest poultry sales yards in Los Angeles. Lately sold over 20,000 birds. We have on hand daily from twenty to thirty different breeds. Ask about P. Cook's Extra Select White Leghorns, the finest, largest, most prolific layers in the world. Only $15.00 per dozen. This week also the best flock of White Minorcas in California for sale. Only $3.00 each for hens. Guaranteed to win in almost any show. We are the largest shippers, both wholesale and retail, of fine poultry. Good White Leghorns this week at $9.00 per dozen. All other breeds in proportion. Write for catalog. Buy where you can get birds that can be depended upon.

P. Cook, 3017 S. Main St., Los Angeles, Cal.

If you want your hens to lay more of those high-priced eggs, feed

West Coast Egg Food

Nothing better made for the purpose, and the price is now only $1.80 for 75-lb. sack, or $45.00 for a ton. If not sold by your dealer, sent to us. Or, if you are distant from Los Angeles, and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

West Coast Mill

Office and Salerooms, 115 Winston St.
Los Angeles, California

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying power and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

BREEDING BARRED PLYMOUTH ROCKS.

D. T. Wieland, Moneta.

Ever since the origin of the Barred Plymouth Rocks their breeding has been more or less experimental. A great many breeders temporarily enter the field each season, buy a few birds or a setting or two of eggs from the best stock exhibited at one of the minor shows, claim to be breeders, mate a few pens, find out it is not as easy as they thought it would be, get discouraged, denounce the breed and quit. On the other hand, the breeding of these birds has been reduced to a science by those who would obtain success, using the knowledge gained in the past as a guide in mating.

Very few breeders give out information that will help the amateur to breed better birds. They think it enough to see what the buyer wants and use the knowledge they have acquired in breeding to further their own interests. They could give to the amateur a great deal of information that would start him on the highway to success if they only would.

A TYPICAL BARRED PLYMOTH ROCK PULLET
Property of D. T. Wieland, Moneta

For the past 20 years I have been steadily improving my flock. I would like to tell you how I mate for best results, but it would take too long. I will just give a few hints as to how I started, what sort of stock to buy, etc. I paid $31.00 and express charges for five Barred Plymouth Rocks, four females and a male, to a breeder who had been a regular exhibitor for three years to my certain knowledge, always winning a large share of the best prizes. For two years I followed his advice on mating with good results, then I thought I had some good birds, so the following winter I showed a few fowls, and, to my great surprise, took some of the best prizes. My knowledge of a poultry show was very limited. In fact, I just sent in my money, told the secretary what I wished to show and he made the entries. I went to the show, knowing not a soul, followed the judges at a safe distance for some time while judging the B. P. Rocks, listened to the Barred Rock exhibitors as they were discussing the merits and demerits of the different winners. I got a little information in this way, read all the poultry papers I could get hold of and finally, getting a little braver, began to ask questions of breeders I thought were posted, attended the shows as the years rolled around, and now, after 20 years, am beginning to think I have learned a few things about Barred Plymouth Rocks.

To those undecided as to what breed to begin with, let me give this advice; take the one you fancy. Yet I know that if you start with a good strain of B. P. Rocks you will stay with them. You cannot help it. The reasons are many. Here are just a few of them.

They are a most attractive fowl for the fancier and an ideal bird for the student of feathers to work upon. Both fowls and chicks are hardy and pullets mature early, beginning to lay at four and a half months old. They are great winter layers, are not affected by weather conditions as most fowls are, laying just the same, hot or cold. This requisite of comfort accounts partially for their incessant and persistent laying the year round. Their warm clothing tells why they can be kept at less cost than other breeds. They are good setters, very gentle and easy to handle, careful of their broods, yet easy to break of broodiness. If you pen them at the beginning, they will lay again in eight to ten days. They are free from disease, the medium sized fowl that the public demands, with fine flavored flesh, yellow skin and shanks. They have grace and beauty unexcelled, and business and beauty so combined that no breed can surpass them where an all purpose fowl is wanted.

THE HEN AND THE FARMER.

The Saturday Evening Post of August 6th, published a most excellent article on "The Farmer and the Cost of Living from a Railroad Man's Point of View." The writer is Mr. B. F. Yoakum, chairman of the executive committee of the 'Frisco and allied lines. The following abstract is clipped from this article:

"After a careful investigation, it is estimated that during the past year the farmers received and the consumers of the city of New York paid, for the following articles of food, approximately the amounts respectively shown:

	Received by Farmer	Paid by Consumer
Eggs ______	$ 17,238,000	$ 28,730,000
Coffee _____	2,402,000	12,009,000
Rice ______	1,354,000	6,191,000
Cabbages _	1,825,000	9,125,000
Onions ____	821,000	8,212,000
Milk ______	22,912,000	48,880,000
Potatoes __	8,437,000	60,000,000
Meat, Poultry ______	219,300,000	291,000,000
Total ___	$274,289,000	$464,174,000

We publish this table as an illustration of the profit that the hen, so long neglected by the farmer, is paying him. The farmer received for eggs 59 per cent of that paid by the consumer and in meat and poultry 75 per cent. The next best profit is represented by milk, on which he received about 46 per cent, while in vegetables he obtained but 15 per cent of the retail price.

Shall the farmer continue then to neglect the hen?

A realization of the value of a well-kept flock of poultry is of greatest importance to him. It is possible that the disreputable appearance of an old-time barnyard flock of mongrels is the real reason why no more attention has been paid by farmers to poultry. We assume this for the reason that we have often noted that when pure bred flocks are kept the farmer is always ready to show his houses and yards to the visitor and will continually speak of the excellent laying record of some pen or bird.

CACKLES AND CROWS.

September 13 work was commenced on a brick, two-story addition to the building of the Coulson Company on upper Main street, Petaluma. The new building will be 40x61 feet in dimensions. It will be constructed on the east or river side of the present big factory and warehouse building of the company.

Let farmers take more interest in exhibiting poultry at the county and state fairs. Pure bred fowls will advertise your farm.

Dispose of the surplus cockerels and save the food that they will require this winter. If they are not good enough to sell for breeding stock fatten them for the market.

If your poultry houses are reasonably tight, it would be a good thing to burn some sulphur to get rid of the mites and lice. The tighter the house is the more thorough will be the effect of the fumes of the sulphur.

Cycle Hatcher Company

MANUFACTURERS OF

Incubators, Brooders and Fireless Brooders

Our machines are the result of 25 years experience in hatching and brooding and are the most practical made. Cycle Hatcher 50 egg size. $6.50. Brooder hatcher 50 egg size. $5.50. Main Office: Elmira, New York. Western Office: 9 Madison St., Oakland. Cal.

Do You Own a Hen?

Do You Want to Build a

- Fresh Air House.
- Open-Front Colony House—Three Plans.
- Colony House for Chicks with Movable Muslin Frames in Front.
- Combination Brooder and Colony House.
- Special House for Extra Males or Small Matings—Two Plans.
- Movable Fence for Mature Fowls or Chicks—Six Plans.
- Trap Nest that Traps—Two Plans.
- Special Nest for Five Setting Hens.
- Safe and Convenient Brood Coop for Chicks—Seven Plans.
- Design of Fireless Brooder—Seven Plans.
- Tested Hot Air Brooder—Three Plans.
- Basket for Shipping Eggs—Two Plans.
- Reliable Food Hopper—Five Plans.
- Good Water Fountain.
- Vermin-Proof Roost Support.
- All the above and many more found in the book.
- Built and Used by Poultrymen—Price 50c.

No Chance for Failure

Each of the above designs, and many more, is fully explained by the builder, and illustrated with one or several clear drawings. Anyone can follow the simple instructions. No theories, no extravagant ideas to mislead you, but the money-making, completed houses and coops prove what the Builders say is true. Read their own words and learn how they do it. One plan will pay for the book.

For a Short Time Only

For new subscribers or a renewal to the Cultivator, we will give you one copy of this great book FREE.

"Built & Used by Poultrymen"	$ .50
"The Standard & Poultry World"	.50
"The Cultivator" one year	1.00
Total Value	$2.00
All Three for	$1.50

We most certainly recommend this book as one of the best of its kind ever published and our readers should avail themselves of this opportunity at once to get a free copy as above.

Enclosed $1.50 for club order with new book.

115 No. Broadway, Los Angeles, Cal.

Boys and girls attending school have splendid opportunities for poultry raising. Except the close attention that must be given to incubators and young chicks, school hours do not stand in the way of poultry raising. Ambitious boys and girls can solve the problems of poultrymen.

There are possibly as many failures in poultry culture as most any other business one can mention. In spite of that fact, however, the "know how" breeders have made good this year in all portions of California. The business is constantly growing, and is rapidly assuming big proportions, particularly in the northern part of the state.

J. R. Schooley of Fullerton who for some years has made the breeding, feeding and rearing of poultry a study, conducting his experiments quietly on his home place on Walnut Avenue, Orange, is building a modern hatchery and poultry plant. His present plant is being rebuilt on a large scale and adapted to up-to-date methods. Last spring Mr. Schooley hatched over four thousand chicks, largely from eggs from his own breeding pens of thoroughbred Barred Plymouth Rocks. His pens now contain breeding stock selected from eight hundred choice fowls for next season's trade in eggs and chicks.

FEEDING GREEN BONE.

Green bones are bones fresh from the butcher, with the adhering gristle, meat, etc. They contain the natural juices as well as the adhering substances, making them superior to the bones that have lain on the ground for a while and lost all the natural juices or animal matter. Green bones are also soluble and capable of having the mineral matter digested.

It has been proved upon analysis that green bones contain in abundance the ingredients which go to make up the growing chick, and in close proportion the different parts of the complete egg. The lean meat and gristle form the white of the egg and about sixteen per cent of the yolk. The marrow and other fat on the bones yield all the necessary lime salts for the shell and the requisite phosphates for the interior of the egg.

According to an analysis by Prof. James E. Rice, the nutritive value of green bones is 1 : 5.3, which is greater than any other form of meat—meat scraps, dried blood, dried fish or animal meal.

CHICKEN MANURE ON THE GARDEN.

Hen manure is an excellent fertilizer to use in the garden and may be used on any of the crops ordinarily grown. While chicken manure is generally considered a "strong fertilizer," it can safely be used in much larger quantities than are usually available.

The best way to apply the hen droppings would be to apply after the garden is spaded or plowed, and rake or harrow it into the surface-soil. The ideal way to use this fertilizer is as a top dressing, and it would be a mistake, in our mind, to plow it under. The plant food in it is more readily available than that contained in barn yard manure, and as it will be readily carried down into the soil, it should be applied to the surface. The roses and other flowers, as well as the vegetables, will be benefited by a light dressing of this manure.

CURE FOR GAPES.

One poultry raiser says in "The Farmers' Guide" that he shuts his chicks affected with gapes in a box and sifts lime and sulphur on them. This will cure them.

Another poultryman gives this method: Take four or five chicks and place in large candy pail or a common nail keg and placed over top a piece of cheese cloth. Then sift a tablespoonful of lime in on them. They will do a good deal of fluttering but you need not doctor them again. Do not leave them in keg more than two or three minutes. I have used this cure for fifteen years and have never lost any chickens from gapes. I also use lime in the drinking water.

FALL APHORISMS.

In a land where all time is summer, we are quite apt to forget the passing of the seasons, or at best neglect to give them serious attention. Here winter is not the serious problem it is in the region of ice and snow, yet it is not without its responsibilities. The advent of our cold and rainy season certainly admonishes the breeder to get his poultry plant in good repair for winter; it is certainly none too soon to get at it.

Good sanitation in the poultry house and yards is of the first importance—its observation is not only good insurance against obnoxious insects, but it is also the best preventive against disease, and certainly induces the comfort and profitableness of the flock. Go at it as though you owed filth and vermin a grudge. Clean the houses thoroughly and then give a coat of whitewash inside and out. Throw out all old nesting material and burn it; then replace with new, and add tobacco stems or some good insect powder for lice prevention.

The poultry house should, of course, be rain-proof and free from draughts; there is no time like the present for making repairs affording insurance against both. To avoid dampness it is also a good plan to bank the dirt around the houses. In the yards provide earth walks or boards, so that on rainy days it will not be necessary to wade through slush and mud. Also see to it that all feeding and drinking appliances are in good repair and clean. And finally sprinkle unslacked lime over the ground in yards and runs, and the chances are your poultry will come through the winter in good shape, and you will have lessened your own labors.

FIGHTING VERMIN.

The warfare against lice and mites in the poultry-house is best begun in the spring or early summer and continued all the year. If, during the first few warm sunshiny days of spring, the houses are given a thorough sweeping and cleaning and some disinfectant like a good coal tar preparation is used, they will remain sweet and sanitary for a month or more if the droppings under the perches are frequently and regularly removed and plenty of fresh air can circulate through the house.

POULTRY SHORT COURSE.

The week of lectures and demonstrations in the poultry husbandry short course will be Oct. 17-29, at the State University farm at Davis. There will be lectures by M. E. Jaffa, H. A. George, S. D. Wilkins, Mrs. Basley, and others. Examples of judging and scoring, mixing of feed, incubator practice and other interesting factors will give interest to the week.

The farmer who has land to till gets a lot more out of a poultry deal than does the man who is a poultry specialist and nothing more, because he can use the droppings to keep up the fertility of his land. Poultry droppings are good for anything that they are put on, and especially so for cane fruit, strawberries and cabbage. It you expect to put out a patch of strawberries this fall, save the droppings from the hen roost this summer, and then plow it under on your strawberry ground. The writer has a patch that was so treated; the plants were set out on the 20th day of last December, and now they are beginning to turn off ripe berries and the amount they produce is the wonder of all who see them, the vines are beautiful in their luxuriance.—N. W. Poultry Journal.

Your poultry house should be in a dry place where it will get the sun. Let it face the south and have plenty of light.

Indian Runner ducks are noted for being great layers. They mature rapidly and are very hardy.

Never send dirty eggs to market. It pays to see that your eggs are clean.

Cabbage is a good green food for laying hens and pullets.

EGG MAKER

I Have Ten Hens and Get Ten Eggs Each Day

by feeding "Lee's Egg Maker." Without waiting another day, go out and count your hens—count them carefully. For a week keep an accurate daily record of the eggs you get. The guarantee below means *you*.

WE GUARANTEE

that no matter what you are feeding, and regardless of [illegible] you are getting at the present time, if **Lee's Egg Maker is added** to the daily ration — make a part of it — the increased egg yield resulting therefrom will more than pay the cost of the Egg Maker, cost of labor required, and **100 per cent profit** on said labor.

We don't care what your hens are doing *now*, we ask you to buy Lee's Egg Maker on our *guaranty* of an *increased* egg-production at a *reduced* feeding cost. Could we make you a better proposition?

The amount of good *digestible* protein is what counts for results in poultry feeding, and America's big feeders say Lee's Egg Maker contains more *digestible* protein than any other poultry food they can buy.

Lee's Egg Maker is almost entirely a meat food and with an actual tested protein feeding value in *excess* of *80* per cent, and you'll find in it the essentials entirely lacking in other prepared poultry food. The best feeding authorities in the country endorse it—and *use it*. *You* can't afford *not* to feed it, whether you have 10 hens or 1000, the proportionate profit would be the same.

Price: 2½ lb. pkg., 25 cts., 25 lb. pail, $2.00. Ask your dealer or send direct to us. We pay freight in 100 lb. lots.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

Malthoid Roofing

Covers buildings in every part
of the world.
You will find it in Japan.
You will see it in Russia.
It protects buildings in Alaska.
It covers houses on the plains
of South Africa.
It is used extensively in Australia—
Thousands of rolls have been
shipped Indo China.
You see it in nearly every
South American port.
Is very popular in Canada.

It roofs the best buildings in
every large American City.
The magnificent buildings of
the Alaska Yukon Pacific Exposition are
covered with it.
The St. Francis and Fairmount
Hotels in San Francisco are
protected by it.

Malthoid has a world wide
reputation.
This is so because it is
the original ready roofing.

Its makers have been making
ready roofings for twenty-six years.

They have always made roofings
that make good.

It's free

Send for it. A new and valuable book on the **"Care of Roofing."**

No matter what your experience has been or what roofing you have used, this book will enable you to take better care of it. Sent free.

113-115 N. Main St. Los Angeles, California

Bees and Their Care

THE MANAGEMENT OF BEES.

J. W. Ferree, Newhall.

There are three methods, the scientific, the let-alone haphazard, and the midway, that is a little of the scientific and a good deal of the haphazard, I believe most commonly practiced in California. Location and kind of bees are very important features, which have not been given the attention they should have. In the early spring the building up of each colony and having them free from disease is of the greatest importance. If in single hives when honey is coming in so as to stimulate them to brood rearing then is the time to attend to this. If early honey is scarce, stimulative feeding should be resorted to, which may be done in different ways. The best way is to have plenty of honey in the hive—breaking the cappings on one side of a comb every three or four days will stimulate them about right. If they have not plenty of stores, feeding honey or a mixture of honey and sugar is necessary. The best way is to feed every evening just a little more than they will use each day.

As soon as they have brood in three or four combs, spreading should be attended to, which must be done very carefully or more harm will be done than good. I repeat, it must be done very advisedly or it had better not be done at all. When the weather is warm enough for the bees to take care of more brood, move the comb of pollen on one side of the cluster one space and insert an empty comb, or one with just a little new honey, or one with a little sealed honey, with the capping well broken. When this comb is used for brood and the bees are able to care for more, repeat the operation.

As soon as the colony is populous enough move the pollen comb on each side of the brood nest one space and insert empty combs. Repeat until the brood chamber is full of brood. If any combs are full of honey so they can't be used for brood they should be lifted out and taken care of, which can easily be done by putting them in a super and setting them on top of a colony that is ready for more room than the brood chamber affords.

When the brood nest is full and the weather is cold and unsettled, what to do next and be happy while doing it is what I have never been able to fully decide. To give them a super of empty combs is bad and to give them foundation is worse. A few combs of honey to put in the super helps some, at least it seems so. To give them a half depth super of combs is good, but necessitates a great many shallow supers and combs and considerable work. When these are full the colony is in fine condition to give a full depth super. The shallow frames of brood are good for building up weak colonies. The next best way is to put four or five combs in the super, put in a division board and let the quilt or gunnysack drop down and cover the remainder of the frames in the brood chamber.

If the bees are wintered in two-story hives the manipulating of the combs will not be so necessary to give them room. For comb honey production keep the shallow frames on until white honey is coming in freely, then take off the shallow frames and put on a super of sections. One super at a time is enough unless colony is very populous. The shallow combs which have brood in them may be used to build up weak colonies, the others to be extracted. When sections are half or two-thirds full lift super and put on an empty one. When the second super is well on the way put on another and thus tier up or rather tier down until the white honey flow is nearly over, taking off sections from top as fast as they are ready to come off, not waiting until every section in super is sealed. Unfinished sections may be put in the outer side of new supers, or supers may be entirely filled with unfinished sections and set on to be finished. Work to get sections finished before the white honey flow is over. Set on a super with shallow frames (which can be extracted) for the amber honey at close of harvest. Full depth combs may be used instead of shallow ones but are not so good, for in extracting, work hard as you will, some will be ready before others. Take a few full combs from those and put in empty combs for a foundation. I generally have half or more of mine three stories high before commencing to extract.

HIVES.

It is conceded the country over that the Langstroth is the best hive and practically all supers or surplus chambers, and other fixtures are made for this hive. The hive was invented about the middle of the last century by the Rev. L. L. Langstroth, and practically no other is in use by the large and successful beekeepers of this country, as well as in many other countries. The name Langstroth refers to the size and shape of frames and the body. There is no patent on the Langstroth hive, and some manufacturers push forward hives of their own make upon which they have patents, as there is more profit in their manufacture, but it would be inadvisable for the beginner to adopt any of these if it is contrary to the verdict, as shown by their practice, of all the well-informed or extensive beekeepers of the land.

The Langstroth Dovetailed hives consist of a bottom, body with moveable frames and division board, cover and any style of surplus super desired according to the kind of honey produced. For the beginner the super arranged with shallow extracting frames is the best, as it is much simpler to use.

The bottom should be of heavy material and have a bee space and entrance on one side of three-eighths inches, and on the other a deeper one to use for more ventilation in the summer. The reversible bottom boards project in front of the hive two inches, affording an alighting board for the returning bees, and is furnished with blocks for contracting the entrance during the winter.

The dovetailed hive bodies are made in two sizes, one for eight frames and the other for ten, both furnished the same with metal rabbets for the projection of the top bars of frames to rest upon, and hand hole cleats that they may be readily carried. Many bee-keepers, particularly those who produce section comb honey, use the eight-frame size, but for the beginner, the ten-frame is preferable as it requires less attention and more room being given, swarming is diminished somewhat. The top bars of frames have a slot into which a strip of comb foundation, which is simply a thin sheet of pure beeswax with the imprint of the base of cell, is inserted and secured by a long wedge-shaped strip. In shallow extracting frames which have thinner top bars the foundation is secured in the groove by melted wax. From this starter the bees build straight combs so that each frame can be removed separately with no difficulty.

In buying bee hives, those who are not familiar with them should order at least one hive made up in order, to see the proper putting together.—Rural World.

Profitable Farming

Intelligent use of our fertilizers will make your farm profitable. Instead of just about breaking even you will see nice fat profits that you can put away for the days when you will want to rest.

For with fertilizers such as we supply, you will get more per acre no matter what the product and of finer quality. Often you can double the farm's production that way. Let us tell you about it.

General Agriculture

TALK AND PRODUCTION MEET.

An Agricultural Fair and Farmers' Institute at Lancaster Unites the Two.

On September 28 and 29 there was held a Farmers' Institute and an Agricultural Fair at Lancaster that was just a little out of the ordinary. Under the talking program of J. B. Neff of the State University it certainly furnished a feast of reason and flow of soul calculated to establish goodfellowship and at the same time disseminate just the information that the Antelope Valley people will appreciate in the exploitation and development of their agricultural and horticultural resources. The Farmers' Fair Association, covering in its personnel the settlements of Lancaster, Fairmount, Elizabeth Lake, Del Sur, Palmdale, Little Rock, Big Rock, Lancaster, and all the intervening country, furnished a splendid object lesson in the agricultural capabilities of its membership. On the opening day the address of welcome was made by Ira G. Gorham, to which Mr. Neff made a happy response. The two days sessions were replete with many interesting talks on subjects particularly interesting in view of prevailing conditions of soils and climates in the Antelope Valley. The exhibits were fruit and vegetables of the greatest variety, alfalfa, chickens, geese, hogs, honey, and also cotton of the very best quality. The Fair Committee consisted of Ted Kornellison, Fred Smith and Clyde Smith. Musical programme was executed by Mrs. O. S. Bulkley, Mrs. C. H. Cram, Mrs. Ira Graham. The arrangements in general were in the hands of F. H. Robinson, J. P. Goytino, Dr. J. T. Arwine, John Demuth, H. F. Keeler.

The judges made the following awards:

Apples—Crow Bros., first; H. F. Keeler, second.

Vegetable display—Capt. W. H. Graves, first; T. Johnson, second.

Wheat—Fred Price, first; Herb Smith, second.

Canned fruit—Mrs. J. T. Arwine, first; Mrs. G. A. Lutz, second.

Jelly—Mrs. A. Dahl, first.

Quinces—Mrs. A. Dahl, first.

Peaches—H. F. Keeler, first; Mrs. Anna Everett, second.

Wines—J. Ritter, first; George Bonninger, second.

Almonds—J. R. Holland, first; Frank Frakes, second.

Pears—H. F. Keeler, first; William Doyle, second.

Onions—Harry Beckley, first.

Cotton—H, Stoughton, first; W. V. Frydenhall, second.

Kaffir corn—W. H. Graves, first; G. H. Fuller, second.

Field corn—M. J. Wilcox, first.

Oats—M. J. Reynolds, first

Wonderberries—L. B. Crocker, first.

Alfalfa—P. B. Lampman, first; T. A. Moorman, second.

Hogs—G. H. Miller, first.

Poultry—White Wyandottes, Naragansett turkeys and young pair Toulouse geese, Dr. J. T. Arwine, first.

White Leghorns—Mrs. G. A. Lutz, first.

Rhode Island Reds—Mrs. A. Keeler, first.

Bronze turkeys, Pekin ducks, Toulouse geese (old) and light Brahmas. W. V. Frydenhall, first.

Colts—Fred Gadde, first; G. A. Lutz, second.

Jersey cows—T. A. Moorman, first.

Jersey heifers—S. S. Lee, first; Jim Robinson, second.

The wind-up of the judges' duties was the awards on babies, which resulted in Mrs. G. A. Sear's securing first and Mrs. A. G. Bennett second.

So pronounced was the interest taken and so well was the effort patronized, that the people are already in line for a similar event next year, only that the Institute feature will be extended to cover four days instead of two, and the exhibits will be more than doubled in extent and variety.

THE NEW MEXICO RANGE CATERPILLAR.

A new range caterpillar which was reported as damaging the ranges in New Mexico has been investigated by the representative of the U. S. Department of Agriculture, and a report of those observations has just been issued as Bulletin 85 Part V, Bureau of Entomology.

The first intimation of the alarming increase of Hemileuca caterpillars in northeastern New Mexico reached the Department in August 1908, and before the end of October of that year the outbreak was under the careful study of an expert. Therefore, the report covers the adult period of this depredating insect in 1908, and the entire active life period of 1909.

The history of the range caterpillar, now designated as Hemileuca oliviae Cockrell, prior to this outbreak is very vague and probably, owing to the fact that they have not been able to distinguish between these caterpillars and those of other species, the information furnished by ranchmen and others is very unreliable. The species may have had its origin in the country east of and adjacent to the Rocky Mountains in northeastern New Mexico. The first authentic history of the genus Hemileuca in New Mexico begins about five or six years ago, and the section around Springer Lake, an irrigation reservoir a few miles from Springer, a station on the Santa Fe Railway, 50 miles south of the Colorado line, appears to have been the starting point of the present outbreak, and from there it has spread north, east, and south.

The area at present is not well defined, but it is known to extend from just north of Las Vegas, N. Mex., on the south, to Las Animas, Colo., on the north and from Cimarron and Kochler, N. Mex., on the west to points within the Texas "Panhandle" on the east—or over an area 200 miles from north to south by 150 miles from east to west—comprising about 30,000 square miles.

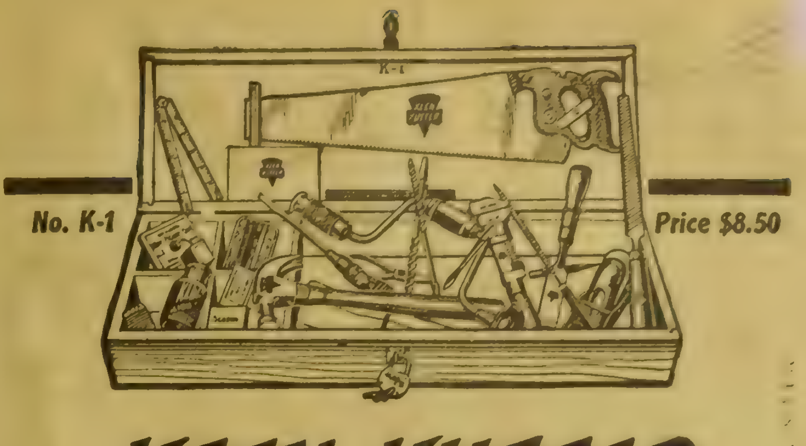
All of this area is not evenly infested, but the insect is more or less prevalent everywhere. Counts made at widely distant points of the caterpillars present on a measured square rod showed enormous numbers present on this range, in some cases as high as 20,000,000 to the square mile, justifying, as conservative, an estimate of 1,536,000,000 caterpillars depredating on the infested area, a number capable of tremendous possibilities for harm, especially when it is remembered that the full-grown larvae frequently measure 2½ inches in length with the diameter of a man's index finger, and are so numerous that one really has to choose his steps to avoid crushing the huge, spiny ugly caterpillars. And the sensation produced when it becomes necessary to walk miles through their myriads is both peculiar and lasting.

PARCELS POST.

Why should our government do more for a foreign country than it does for her own people, is one of the questions that is hard for the average citizen to solve. Yet the postoffice department is doing this and has been for years. Now another country has been added to the list.

This time it is a South American republic. The terms are similar to those already existing between this country and about twenty other countries. An eleven-pound parcel can be mailed to these far away countries at 12 cents per pound. Our domestic post provides for only a four-pound parcel and the rate is 16 cents per pound. Why not treat ourselves to some of the benefits granted the citizens of foreign countries?

The grange asks for the co-operation of all organized as well as individual effort to impress our law makers with the fact that the people demand equally as good service and at as reasonable rates for transporting through the mails as is accorded to foreign nations.—The Grange.



KEEN KUTTER
Tool Cabinets

A boxful of tools—good tools—just the kind you would select were you an expert carpenter or cabinet maker. That's what you get when you buy a Keen Kutter Tool Cabinet. In fact these are the only tool cabinets made containing a complete set of tools under one trade mark and guarantee, and it's a real guarantee—a fair and square guarantee—one that refunds your money if you are not fully satisfied.

Every tool has a place of its own and it's there for service. Whatever the tool—however hard the work—you won't be disappointed.

Keen Kutter Tool Cabinets are made in many different sizes, the prices varying with the number and kinds of tools selected. There's the $8.50 size containing enough tools for any ordinary job, several between this and $50.00 and one at $125.00, which includes work-bench, vises, etc.

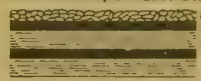
Cross-section, Genasco Stone-surface Ready-Roofing



Pioneer ROOFING

Booklet and Samples

Will stand the test of time — and the elements. Sunproof and rainproof. Needs no paint or repairs. Suitable for any roof— flat or pitched — any building.

Pioneer Roofing comes in convenient rolls, with everything necessary for laying. Requires no special tools — no experience.

Why not get the best in the beginning? It's cheaper in the end.

Pioneer Roofing is its own best advertisement. Let us send you samples and prices. Also our 32-page illustrated Roofing Booklet. Tell us what your requirements are, and we will send samples and special information of the roofing that is best for your particular purpose.

Poultrymen, Attention

We want to tell you what we are doing. We are erecting at the present time Yards and Pens for the largest and most up-to-date plant for fancy poultry in Southern California. We can carry on hand with our new yard about 3000 birds. We sell every standard variety, of Pullet, Cockerel, Laying Hens and Cock. We have them on hand EVERY DAY OF EVERY WEEK OF EVERY YEAR. We have been in the Hatching business for 12 years in the west. The Pioneer Hatchery has been established for several years, and from a small start is now the largest baby CHICK DEALERS IN THE ENTIRE WORLD. No order of any kind in the Poultry Line is too large for us. If you want to sell 100 or 1000 hens or more we will be glad to bid on them for spot cash.

We are shipping at present about 7500 baby chicks per week, of the Reds, Minorcas, Leghorns (White and Brown), Barred Rocks, Buff Orps., etc. Whatever you need in our line we will be glad to make a price on. If we can't sell you better poultry for less money, don't buy from us. INVESTIGATION is all WE ASK.

The Pioneer Hatchery Co., 108, 112, 114, 116 East Eighth
Los Angeles, California

New High Grade Automobiles

at Prices Lower Than the Price of Medium Grade Cars

To Prospective Automobile Buyers:

You naturally wish to purchase the highest grade car you can get for your money, and you naturally want a higher grade car than the dealer can afford to sell you for the amount of money you wish to pay—we will meet your views for a short time.

We have a limited stock to dispose of—all high grade—and all prices to meet the needs of moderate priced car buyers.

Whiting, Davis and Westcott Cars
in Two and Five-Passenger Models

These are not shopworn cars, they have never been driven a mile, and are the latest models received.

We have sold the lease of our garage and have not at present the necessary equipment and room at our store to properly handle automobiles, so we offer you the opportunity to buy a car of higher grade than you ever thought of owning and at a price no higher than is charged for a medium grade car.

Call at Newell, Mathews Company, 200 North Los Angeles Street, Los Angeles, Cal., or write us, stating whether you wish to buy a one-seat or two-seat car and we will send you full information or have our salesman call.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Red Spider.

Please give me best method of fighting red spider.—R. R. B., Hanford.

The dry lime-sulphur mixture may be used. To be the most effective use the high-grade flowers of sulphur and hydrated lime. Thoroughly mix and apply with dust machine, or if water spray is preferred, use sulphur 30 pounds, stone lime 15 pounds and water 200 gallons.

Best Apple.

What is the best apple to plant for commercial purposes? How many years before they come into bearing, boxes per tree, and how long will apple trees proves profitable?—C. H. C., Hughson.

The best information regarding the most desirable fruits for any section is to be had in the neighborhood. Every community differs. For example, in Watsonville, the Newtown Pippin, Bellflower and White Winter Pearmain do exceptionally well, but even in that small valley different sections are given over to special varieties. In Orange and Los Angeles counties where apples are grown, they are generally the Winter Pearmain. Now as to which of these apples would do the best in Stanislaus county we cannot say. Possibly if winter apples were set, the White Winter Pearmain would be the best. The number of boxes per tree depends so much on the variety and location that it is impossible to give definite figures. They will usually bear at five or six years and increase of course for a great many years. The apple is a long lived tree and should produce profitable crops for a lifetime.

Walnuts.

Does Western Oregon compare with Southern California in producing nuts? What is the best variety of walnuts to plant? How far apart should they be set? How many years before they come into bearing? What is a fair estimate in pounds per tree, and how many years will they give paying crops?—C. H. C., Hughson.

Walnuts which will do well in one section often will not in another. The varieties which have proven great money makers in Southern California would not be the best to plant in the vicinity of Hughson. This is because of the earliness of the blooming season. Probably the Mayette, or Concord would be the best varieties for your section. In a soil where large trees are expected, planting 50 or 60 feet apart should be the rule. It might be advisable to interset, thus nearly doubling the number of trees per acre. These additional trees could be left standing for perhaps fifteen years, then removed, but we notice few orchardists have the nerve to take out big, fine. full-bearing trees at that age. The result is that they crowd and the entire orchard becomes unprofitable. Perhaps the better plan would be to interplant to peaches, alfalfa, corn, or annual crops.

Walnuts should yield sufficiently at the age of five or six years to pay cost of cultivation. Length of life depends upon soil and water conditions, also upon care received. One walnut grower in Southern California says that he plans to spend on his walnut grove at least $30 per acre per year in fertilizers, cultivation and irrigation. Few walnut growers are so liberal. Trees are now bearing their heaviest crops at forty years of age in some parts of California. Therefore it would be hard to tell how old a tree will bear profitable crops.

Fruit in Arizona.

What kind of trees should one plant in this part of Arizona? Altitude is 4000 feet, hard frosts in April and sun warm during the day time, soil heavy clay. Would especially like to know as to apples and grapes.—Subscriber, Douglas, Ariz.

It is impossible to state definitely what fruits will do well in a new section; it is a matter for experiment. Without question, peaches of nearly every variety will do well. With apples, it would be a matter of testing, but we believe both summer and winter apples would be profitable under such conditions. Practically all the American varieties of grapes are sure to do well. In the Europeans, we believe the Emperors, Cornichon, Tokay and Malaga will be best. Thompson Seedless and some others we think would not succeed so well with you.

Pecans.

At what age will pecans come into bearing, and will they do well in the interior valleys where the thermometer reaches one-hundred in the summer? We have some fog,—Subscriber, Nordhoff.

We do not think pecans would do under the conditions you name. However, they are being tried in this State and some maintain that they will make good. Nearly all the Southern states, and especially Texas, are planting heavily and the pecans are reported to be bearing exceptionally well there. Lands in these sections are probably cheaper than in California, therefore unless it is proved out that a variety will do exceptionally well here, we would advise caution in planting. Some trees near the coast in this state have grown to fine size and have a healthy appearance but fail to bear nuts in paying quantity.

Crown Root Borer.

Have peach trees and also apricots on peach roots, which have reached the age of five years. They are beginning to die. The roots seem to die first, showing exuding gum, later the leaves wither, and from the first tree observed to be affected the circle of dying trees widens in the orchard. What is the cause and cure?— E. R. T., Vacaville.

Not enough particulars are given to enable us to answer this question other than to give a mere surmise that the trees are attacked by the crown root borer. If that is the case, uncover the roots and probe with a wire to destroy the borer. This seems to be the only effective method of handling the pest.

Late Peaches.

What is the best late freestone in San Diego county in location about 2000 feet above sea level?—I. T. D., San Diego.

Probably the latest peach is Bilyeu's Late, or October peach, said to be an excellent shipper, with white flesh, rather coarse, but sweet. The Lovell, Muir and Elberta are all good, though by no means as late as the above named.

Red Spider on Beans.

I enclose leaves from beans infested with insect. What is it and how may it be controlled?—Subscriber, Nestor.

These leaves are infested with the serious pest, red spider, Dust the foliage thoroughly when moist with dew with mixture of lime-sulphur, formula for which is given in other query on red spider this week.

Developing Heifers.

Two heifers fresh only about a month are already drying off. Have fed on dry alfalfa with straw to run to. Have tendency to lay on fat.—W. A., Modesto.

Young stock are like children not fully effective as workers, this is one reason why many men cannot develop a heifer into a first-class cow, they fail in feeding, at a loss they are putting their money into a hole.

In this case, I should say these animals need something succulent to eat. Pumpkins, pie melons, beets or anything that is green. If these articles cannot be obtained, then try putting the hay they are to be fed into a moist condition. If the hay is taken the day before and made wet all through then closely packed and covered with sacks, by morning it should begin to heat a little. Feed it and see if the cows do not respond. Remember this is a change of food and only feed a little at first or the cows may get pains in their stomachs. —M. E. S.

Soft Brown Scale.

What is the insect on inclosed grapefruit twig and leaves?—V. B. B., Highland.

Soft brown scale which may be easily controlled by spray of kerosene emulsion, whale oil soap or even strong suds of common hard soap will be beneficial.

POULTRY SHOW DATES.

Stockton, Cal., Nov. 8-12, 1910. First Annual Exhibition of the San Joaquin County Poultry Association. Eugene P. Sabin, Secretary, Stockton.

Oakland, California, Nov. 22-27, 1910. Annual Exhibition of the Alameda County Poultry Association. E. K. Healey, Secretary, Alameda, Cal.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey, 108 E. 8th St., Los Angeles, Cal.

FARM LANDS FOR SALE.

Owens Valley Lands—The greatest opportunity for the California farmer today is awaiting him in the Owens River Valley. This remarkably fertile spot possesses more attractive features than any land in California. The only land in California that will produce with equal results the big red winter apples that have made Washington, Oregon and Colorado famous, and have brought to the owners untold wealth. California farmers should learn real conditions of apple culture and appreciate that these lands under development, are equal in value to our choicest orange lands. The conditions which surround Owens River Valley are ideal in every particular. Not only is the climate nearly perfect and the scenery all that one could desire, but the productiveness of the soil excels anything in California. Corn 13 feet high, with ears 18 inches long, running 70 bushels to the acre. Potatoes that run 500 bushels to the acre, equaling the famous Greeley, Colorado district, where such land is worth $500.00 an acre. So remarkable is the productiveness of the soil in the Owens River Valley that one should consider its value purely upon its ability to earn, rather than to compare it indifferently with acreage in any other section. There is just as much difference between the Owens River Valley land and the land that is ordinarily offered as there is between the value of Hill St. and Broadway property. The Owens Valley land is 4,000 feet above the sea, with just sufficient frost in winter to make a perfect red apple. Fogs, hail or gales are unknown. The supply of pure mountain water is unlimited and the completion of the new Southern Pacific railroad, which will be running in 30 days, makes the entire proposition ideal. You owe it to yourself to thoroughly investigate this property, for there will be, without a doubt, a greater increase in value in the Owens River Valley in the next few years than in any other point in California. In fact, we look for nothing short of a boom the coming year. If you own orange or walnut land that you can sell at a good price, you will certainly be making a good move to dispose of it and go into this new country. We can doubtless help you in selling your land. We have done it for others. Drop into this office and talk with our representative, who is an old Rogue River apple man of 20 years' experience, and who has studied Owens Valley conditions and can give you a very intelligent description of our property, or drop us a postal and permit us to send you our literature. James R. H. Wagner, H. S. Cook, 329 South Hill St., Los Angeles, Cal.

For Sale—40 acres of land planted to beans and corn. About 8 acres of grown Eucalyptus timber, 3 acres in family orchard, windmill, tank, barns, 13 chicken houses, brooder house, everything necessary to run four or five thousand hens. New wagon, 2 good horses, buggy, plows, cultivator, within 4 miles of Santa Maria oil fields. 5-room house, nicely shaded with pepper trees. A good opening for a young couple. Price $4,000. Apply to W. J. Webb, Owner, Santa Maria, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

Fresno County—For sale, 320 acres; 160 alfalfa, 160 Muscat vines; fenced, cross-fenced, 1000 tons of alfalfa this year, 60 tons raisins, abundance cheap water, fine buildings, implements, 8-ton wagon scale; show profit 20 per cent, can make 30 per cent. Can subdivide. E. E. Bush, 805 Union Trust Bldg., Los Angeles.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

20-Acre Ranch—In the orange belt north of Exeter. 10 planted to oranges, well that tested over 100 inches, with pumping plant installed. Electric lights, running water, and ideal location. ½ mile from railroad. For one desiring a home, they could not find things nicer or location better. Address Box 103, Visalia, Cal.

Irrigated Land For Sale, Cheap—In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address Manager, American Rio Grande Land & Irrigation Co., Mercedes, Hidalgo County, Texas.

"ENTERPRISE"
Meat and Food Chopper
No. 10 $2.75
Turns scraps and left-overs into most savory dishes. The "Enterprise" is the only meat and food chopper that actually *cuts* the meat, fish, vegetables, fruits, etc., without crushing or mangling. The four-bladed steel knife revolving against a perforated steel plate does the actual *cutting*. The "Enterprise" has the fewest parts, is easily cleaned, cannot rust, and is practically unbreakable.
We make 45 sizes and styles of "Enterprise" Meat and Food Choppers—illustrated catalogue on request.

"ENTERPRISE"
Sausage Stuffer and Lard Press
No. 25 4 quart size $6 00 Made in 9 sizes and styles
This machine will pay for itself in what it saves you in one butchering. The easiest, quickest, cheapest way to make the best sausage and lard. Strongly built, carefully and accurately fitted and does its work without a hitch. Our patented corrugated spout prevents air entering the casing, assuring perfect filling and preservation of the sausage. Can be changed into Lard or Fruit Press in a moment. Write for catalogue.

"ENTERPRISE"
Bone, Shell and Corn Mill
No. 750 $9 50
This winter feed your hens on bone, shell and corn ground in an "Enterprise" mill and note the big increase in the egg supply.
The "Enterprise" is a splendid general, all-round mill—the best kind for the farmer and poultryman. It grinds *dry* bones, oyster and other shells, corn, etc. We also make many other household specialties. Write for free catalogue.
Sold at Hardware and General Stores Everywhere.
Write for "The Enterprising Housekeeper" a book containing 200 selected recipes and kitchen helps. Mailed to any address on receipt of 4c in stamps.

Household Department

THE GOOD-NIGHT KISS.

O mothers, so weary, discouraged,
  Worn out with the cares of the day,
You often grow cross and impatient,
  Complain of the noise and the play;
For the day brings so many vexations,
  So many things go amiss;
But, mothers, whatever may vex you,
  Send the children to bed with a kiss!

The dear little feet wander often
  Perhaps from the pathway of right.
The dear little hands find new mischief
  To try you from morning till night;
But think of the desolate mothers
  Who'd give the world for your bliss,
And, as thanks for your infinite blessings,
  Send the children to bed with a kiss!

For some day their noise will not vex you,
  The silence will hurt you far more;
You will long for their childish voices,
  For a sweet, childish face at the door;
And to press a child's face to your bosom,
  You'd give all the world for just this,
For the comfort 'twill bring you in sorrow,
  Send the children to bed with a kiss!

—New Orleans Picayune.

HENNY PENNY.

Here is an old, old story that mothers and nurses have told to children for centuries:

Out in the morning early, while the dew was on the grass, came Henny Penny looking for her breakfast. And she went through the hole in the wall into the garden, where her mother had told her a hundred times she must not go.

As she picked here and picked there, she came among the pea vines and a pea pod opened and dropped a pea upon her tail. Then Henny Penny thought the sky was falling and she ran and ran until she came out through the hole in the garden wall.

There, in the hen yards, she met Cocky Locky and cried out, "O, Cocky Locky, the sky is falling and I must go and tell the king."

"How do you know?" asked Cocky Locky.

"I saw it with my eyes and I heard it with my ears and a piece of it fell on my tail."

"I will go with you," said Cocky Locky.

So they gaed and they gaed and whom should they meet by Ducky Daddles. And when Ducky Daddles saw them he cried out, "O, Henny Penny, Cocky Locky, where are you going?"

And Henny Penny said, "O, Ducky Daddles, the sky is falling and we must go and tell the king."

"But how do you know?" said Ducky Daddles.

"I saw it with my eyes and I heard it with my ears, and a piece of it fell on my tail."

"I will go with you," said Ducky Daddles.

So they gaed and they gaed, and whom should they meet but Goosie Poosie. And Goosie Poosie said, "Oh Henny Penny, Cocky Locky, Ducky Daddles, where are you going?"

And Henny Penny said, "O, Goosie Poosie, the sky is falling and we are going to tell the king."

"But how do you know?" asked Goosie Poosie.

"I saw it with my eyes and I heard it with my ears, and a piece of it fell on my tail."

"I will go with you," said Goosie Poosie.

So they gaed and they gaed, and whom should they meet but Turkey Lurkey. And Turkey Lurkey said, "O, Henny Penny, Cocky Locky, Ducky Daddles, Goosie Poosie, where are you going?"

And Henny Penny said, "O, Turkey Lurkey, the sky is falling and we must go and tell the king."

"But how do you know?" said Turkey Lurkey.

"I saw it with my eyes and heard it with my ears and a piece of it fell on my tail."

"I will go with you," said Turkey Lurkey.

So they gaed and they gaed, and whom should they meet but Fox Lox. And Fox Lox was out in the morning early looking for his breakfast.

Now when Fox Lox saw them coming he stood in the road and said, "O, Henny Penny, Cocky Locky, Ducky Daddles, Goosie Poosie, Turkey Lurkey, where are you going?"

And Henny Penny said, "O, Fox Lox, the sky is falling and we must go and tell the king."

"But how do you know?" said Fox Lox; and he looked east and he looked west and he looked up and he looked down, but all he could remember was that it was breakfast time.

And Henny Penny said, "I saw it with my eyes and I heard it with my ears and a piece of it fell on my tail."

Then Fox Lox said, "O, Henny Penny, Cocky Locky, Ducky Daddles, Goosie Poosie, Turkey Lurkey, shall I show you the way to the king's house?"

And Henny Penny said, "Cluck!" and Fox Lox led the way, and they gaed and they gaed, and at last they came to the house, where Mrs. Fox Lox and all the little Fox Loxes were waiting for their breakfast. And Fox Lox stood at the door of the house where all the Fox Loxes were waiting for their breakfast, and said with a bow, "O, Henny Penny, Cocky Locky, Ducky Daddles, Goosie Poosie, Turkey Lurkey, this is the king's house. Shall we go in and tell the king?"

So they gaed and they gaed in at the door of the house where Mrs. Fox Lox and all the little Fox Loxes were waiting for their breakfast. And I suppose the sky must have kept on falling, for neither Henny Penny, Cocky Locky, Ducky Daddles, Goosie Poosie, nor Turkey Lurkey ever came out again.—Kansas Farmer.

SOME GOOD RECIPES.

A number of the ladies of Escondido are furnishing The Times-Advocate of that city a number of original recipes and from them we clip:

Chili Sauce.

Eight quarts of tomatoes, chopped, (not too ripe), four quarts of vinegar, four cups of sugar, one cup salt, six very large green peppers, (not the hot ones) and two large onions, peppers and onions chopped, two tablespoons celery seed and five of white mustard; one tablespoon each of cloves and cinnamon, cayenne pepper to taste. Cook till the desired thickness and bottle while hot.—Mrs. Frank Stiles.

Orange Pudding.

One cup of bread crumbs moistened with milk, one-half cup of sugar, juice of one orange, and grated rind of one-half orange, yolks of two eggs, whites of four. Stir in the last thing, the sugar added to the beaten whites. Put the pudding pan inside of a pan of water and bake. Sauce for same—Butter the size of a walnut, and one cup of sugar creamed, add the grated rind of one-half orange, one-half cup of milk, yolks of two eggs and cook all in hot water until thick.—Mrs. W. L. Ramey.

Boiled Salad Dressing.

Nice to serve on sliced tomatoes, lettuce, artichokes, nut salad, etc.; will keep a long time if in cool place. Beat in a bowl three tablespoons olive oil, salt spoon mustard, pinch of salt, and one tablespoon sugar, add one tablespoon flour and two beaten eggs; mix all well together, add two tablespoons vinegar, three-fourths cup of cream or sweet milk, and put into double boiler, cook until like custard. Stir all the while it is cooking, so it does not curdle; when cool put in a jar and keep in a cool place. —Mrs. J. H. H.

Cucumber Salad.

Peel and chop green cucumbers, select those about the size used for slicing for the table. To one quart of cucumbers add one-half cup of onion chopped fine. To each quart of cucumber and onions add one-fourth cup of salt. Mix and let it stand over night. In the morning drain through a thin cloth or sieve till quite dry. Then add white mustard seed, celery seed and black pepper to taste. Cover with good vinegar. Keeps best in glass jars. Put a piece of broken crockery on top to be sure it remains covered with vinegar. —Mrs. Frank Stiles.

Spanish Stew.

Take a round steak, cut in small pieces, fry brown then put in a little water; let simmer till tender, cut one large onion in pieces and fry brown, one chili pepper, one can of tomatoes, cook till thickens slightly, salt and pepper to taste, pour over meat that you have simmering.—Mrs. C. A. Richards, Gridley.

WASHING KNITTED GOODS.

Knitted and crocheted articles will come through the cleaning process looking almost as well as new if the cleaning is carefully done. Woolen shawls are more easily washed than any other article because they can be kept in perfect shape by basting to a piece of thin muslin before washing. Lay the shawl on a piece of muslin a little larger than the shawl, then baste in place with long stitches and strong thread and cover with another piece of muslin and baste this enough to hold in place, then it is ready for washing. If the articles are not very soiled, they can be freshened considerably by rubbing them through hot corn meal, using it as if it were water, and the best way to clean them is to put them in a thin sack and pour a cupful of the meal over them, then rub the sack between the hands, and when they are clean, shake and brush until all the meal is out. When actual washing is necessary, make a strong suds by stirring enough pearline in warm, soft water to make a nice lather, and the two suds and rinsing water must be the same temperature to prevent shrinking, and as warm as can be borne comfortably by the hands. Put in the article to be washed and clean by pressing and squeezing between the hands, then put through a light suds and rinse through two or three waters with a little ammonia in each. If a shawl has been basted to a cloth before washing, it can be hung over the line until dry, but baby caps and sacks or any such articles should be put in a cheesecloth bag and hung in some breezy place until dry. Shake the cheesecloth bag often while drying the article. This is an excellent method of washing any woolen article and of any color, but in no case should they be rubbed hard or twisted in wringing, and while delicate colored articles should be washed, rinsed and dried as quickly as possible, the all white ones are improved by soaking in the suds, and they will come out looking almost as nice as new if the cleaning and drying are carefully done.—M. H.

WHAT WE NEED.

"Doctor," said one of those self-centred ladies who are always extracting opinions gratis from the medical profession, "what do you consider the best food as a constancy?"

"Hope, madam," returned the Doctor, promptly, "at all times and in all places. Not a senseless optimism, but a self-respecting Hope. Heaven and Nature intended it to be the chief pabulum of the race." The table dared not smile, and the doctor, having secured a few minutes' immunity, declined "wholesome" prefaces, and fell upon a robust breakfast of bacon and eggs, waffles, and hot rolls. The lady regarded him wistfully, for the doctor ate with appetizing gusto. A stomach long trained on other people's theories concerning edibles was not to be trifled with, so she was fain to satisfy herself upon a tasteless cereal, and then nibbled a little dry toast and sipped a woful substitute for coffee. But the doctor is nothing if not humane, so between his waffles he looked across at her pleasantly and began: "I said that because what a doctor actually does or gives is infinitely less in its effect than what he suggests. This is a truth as old as Hippocrates and Galen, though perhaps only in this age are we beginning definitely and intelligently to utilize it. Happiness is the substance and aim of life and living, and hope is nine-tenths, say, of happiness; its greatest factor; therefore beware of unconsciously dispensing with hope."—Harper's Weekly.

ONWARD TO THE GOAL.

Little sweating,
Never fretting,
Steady right along;
Little pleasure,
Double measure
When you come to song.

Onward ever,
With endeavor,
Work with heart and soul,
You'll be thriving
While you're striving
And will reach the goal.
—Rural World.

HOUSEHOLD HINTS.

A valued subscriber at San Luis Obispo writes: Onions baked in their jackets are excellent and readily digested; they will leave no after-taste nor smell. Onions steamed are equally innocent. Most vegetables that are good boiled are better steamed.

TRAPPER'S GUIDE FREE

Tells you when, where and how to trap. Tells you of Animal Baits that are as important to a trapper as traps. Reveals trapping secrets and gives methods that will increase the catch of any old trapper and quickly make successful trappers of the inexperienced.

Tells how to prepare skins and how to get the most money for them.

The book also contains the Game Laws of all States and Canada and gives other information worth many dollars to any trapper. It will be sent you free if you write at once.

Hay.

Scott, Magner & Miller say:

Arrivals of hay on the market here for the past week have been 5000 tons, being exactly the quantiy we had received the preceding week. While there has not been any change in prices to speak of, there is a little firmer tone to the market on account of the fact that the hay is being pretty generally cleared up from the fields and the knowledge that hay will have to be taken from the warehouses shortly to supply the regular current demand.

The medium and poorer qualities of hay are just as dull and slow to move as they have been heretofore. It is in the higher types of hay that we find the market a little firmer, and on fancy hay, of which variety there has been very little offering, there is quite a little inquiry.

There is a great deal of alfalfa hay coming in, but the market on this article remains steady at our quotations, and the heavy arrivals are being readily taken care of for shipping purposes to the North, and for general trade, which is active on this article.

Deciduous Market

SACRAMENTO, Oct. 1st, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning September 30th, 1910.

Peaches.

Twenty-two cars. The few peaches still going forward are mostly destined to the auction markets. There may be a few more cars next week, but not many.

Pears.

Twenty-five cars. The pear movement is rapidly drawing to a close and a few days more will see the end of the movement.

Grapes.

Six hundred and eleven cars. The grape movement has shown a very considerable gain over last week caused by uncertainty in regard to the weather which has stimulated the grower to extra exertions in moving out his crop as rapidly as possible. This movement of last week will undoubtedly be the heaviest of the season. There is every reason to believe that shipments will decrease from this time, although we expect to have plenty of Tokays to offer for the next two or possibly three weeks. Some Cornichons are moving and there are still a few Malagas available. Very few Emperors will be moved until Tokays are finished, or nearly so.

Weather conditions have continued favorable although at this season of the year showers may be expected at any time.

Citrus Market

LOS ANGELES, Oct. 5, 1910.

Practically all the green Valencias have been disposed of and most of the stock now going forward is of excellent quality. Prices are even better than they have been for some weeks and there is promise that the 500 cars yet to go will hold for the best of returns.

The new crop of Navels will be considerably earlier than for several years, which is a fortunate feature considering the large production. Tulare county may begin shipping as early as the 20th of this month and quite surely before the 25th. Southern California shipments will probably not start until the middle of the following month, but in any case a large supply of holiday fruit will be sent. The fruit now promises to be of high quality.

Lemons continue to command the best of attention and prices will remain firm for six weeks or two months, if not longer.

Shipments.

Shipments of citrus fruit to date since November 1, 1909: 29,525 cars, of which 24,917 were oranges and 4,608 lemons. To same date last season: 37,301 cars, of which 31,265 were oranges and 6,036 lemons.

NEW YORK, Monday, Oct. 3.—The New York citrus market at this season of the year, as is only natural, remains comparatively quiet with practically no fluctuations on established brands of high grade fruit. When the fruit is offered in limited quantities the ultimate consumers are almost solely those desirous of obtaining the highest quality and willing to pay it. Lower grades of poor color and eating qualities, which have been diverted all over the country are arriving on a market already surfeited with a liberal supply of deciduous fruits possessing excellent eating qualities and consequently encounter a dull market with prices possessing a distinctive fluctuation which varies according to the degree of the poorness of the fruit. This condition will undoubtedly continue with but little variation throughout the present season. Little changes will take place in the Valencias until the Florida and Porto Rican season, which is now rapidly approaching, becomes a factor. Then orange consumption will become more general, and outlets, which at present remain closed on account of the high prices and free supply of deciduous, will be opened.

Nine cars of oranges, two cars of lemons and one car of grapefruit were sold. The market was very strong on good quality oranges and lemons. The weather was clear and fair.

CINCINNATI, Monday, Oct. 3.—Warm. Very strong on Valencias and lemons. One car Valencias and one car Florida grapefruit sold. Valencias—Pet, S. A. Exchange, $3.20; El Capitan, $1.70. Florida grapefruit, $3.20.

NEW YORK, Tuesday, Oct. 4.—With but two cars of Valencias offered today it is difficult to quote the market with any degree of accuracy. Suffice to say prices and conditions remained practically unchanged. A small quantity of Porto Rican grapefruit and oranges was placed on sale and was absorbed readily at good prices. Fancy grapefruit of excellent quality sold at $3@6, with choice, $2.50@5¾; ordinary stock, $1¾@2.50. A limited quantity of Porto Rico oranges found a ready sale at $2.05@3.05; fancy stock, $3.05@3.75, averaging $3.54. Three cars of Florida grapefruit were also put through the auction at prices which made it apparent that grapefruit of good quality is wanted badly. Fruits brought $3¾@6. The entire offering of Florida grapefruit was of good color, weight and flavor.

Two cars were sold. The weather was clear and unchanged; warm.

VALENCIAS—	Avge.
Nonpareil Covina Exchange	$4.55
Red C, Covina Exchange	2.85
Cougar, Covina Exchange	3.40

BOSTON, Tuesday, Oct. 4.—One car sold. Weather favorable. Market very strong.

Valencias—Nonpareil, Covina Ex-Covina, $4.50.

CHICAGO, Tuesday, Oct. 4.—Lemons are selling very well. There is quoted a steady to firm market. Boxes—California choice, $4.75@5.00; common, $4@4.50.

Oranges—In rather small supply. Boxes, late Valencias, extra choice, $4.25@4.50; choice, $3.75@4.00. Grapefruit, Florida, crates, $.50@5.00.

EDUCATIONAL BUTTER SCORING CONTEST.

The highest score in the second year, scored September 26, 1910, at the University Farm, Davis, California was 95½, secured by Golden Creamery, Etna Mills. While the number of entries submitted at this time was somewhat discouraging, the quality exhibited was very gratifying. At no individual contest in the past two years have we met as high average quality as at this time, though the best score was not as high as has been attained on several other occasions. This is due in part to the fact that those who have given their support to the contest from the first are now reaping its benefits in the form of good scores.

The following report shows but one score less than 90, and an average for all of 93:

Golden Creamery, Etna Mills	95½
Castroville Cream., Castroville	94½
Suisun Creamery, Suisun	94½
Bodega Creamery, Bodega	94
Ceres Creamery, Ceres	94
Santa Ysabel Creamery, Paso Robles	93¾
Pioneer Creamery, Ferndale	93½
Salinas Creamery, Salinas	93½
Fresno Creamery, Fresno	93
University Farm Creamery, (Not Competing)	93
California Polly. Shcool. (Not competing)	91½
Standish Creamery, Standish	91¼
-------- --------- -------------	87½
Average	93.03

Interest centers now in the outcome of the current year's contest. As will be recalled, the following conditions were imposed relative to the awarding of prizes and certificates of merit, as announced at the beginning of the year. "There will be one class—Creamery Butter—and three prize cups for those having the three highest averages, respectively, of the six separate scorings during the year." "A certificate of merit will be awarded to each contestant whose six scorings average 92." "Those sending only five entries, with an average score of 93, will receive a certificate of merit." "A suitable prize will be awarded to the individual sending either five or six consecutive entries showing the most marked improvement in methods and quality." "Contestants are limited to one prize."

The sixth and final entry for the current year will be called for toward the end of November.—Herbert A. Hopper.

Mother (looking over her boy's shoulder): "Your spelling is perfectly terrible."

Little Son—"This isn't a spellin' lesson. It's a composition."—Good News.

AUTO TALK.

Every county in the state is falling into line on the good roads proposition—making way for the automobile so the automobile can make money for you. To some people the auto means only pleasure and convenience; to the rancher it is a business proposition. It saves time; it saves labor; therefore makes money. Some of us are willing to work hard. More of us don't mind wasting time. But one and all we would like to have more money, and that is just where the auto can help the enterprising man. Neither does it take a mint of money to buy and run one nowadays. The time is past when it was extravagant to purchase a car and ruinous to keep it. Cars are made to suit all requirements. If what one wants is a high grade, durable all around satisfactory machine, it is to be had for what he would pay for a fair team of horses. All one needs to do is to open his eyes to the offerings of the reliable houses. One of the old, established firms of Los Angeles, the Newell Mathews Company of 200 North Los Angeles Street, announces that it is disposing of a limited stock of high grade cars, the Whiting, Davis and Westcott, of the latest models, at the price of a medium grade car. They will be glad to show these cars at their place of business or will give full particulars to anyone interested who will write for information.

CAN YOU SAW AND HAMMER?

If you can, you can fit out your poultry house with 1910 conveniences. Other poultry keepers who work at their regular trade or business make hoppers, ordinary and trap nests, fireless brooders, fresh-air doors and windows, portable fences, and even fresh-air and portable houses, during their spare time, and you can do the same. Probably you have never been told how these conveniences can be built—everyone doesn't know these things—but you now have an opportunity to learn from the builders themselves.

Simple descriptions and 146 illustrations of everything the builders have found "just what the doctor ordered" are contained in a new book **Built and Used by Poultrymen.** This is the only book that tells you how to make these things just as though you were talking face to face with the builders themselves. Mr. Jensen tells you how he built two kinds of fireless brooders (one is shown above), and so on through the *fifteen chapters.* Read their titles and see the large number of subjects treated.

Modern Breeding Houses. Modern Colony Houses. Modern Brooder Houses. Houses for Indoor Brooders. Houses for Males and Small Pens. Adapting Barns for Poultry. Movable Fences and Fencing. Nests and Trap Nests. Brood Coops, Runs and Pens. Modern Fireless Brooders. Hot-Air Brooders. Shipping Day-Old Chicks and Eggs for Hatching. Food Hoppers and Fountains. Methods of Sprouting Oats. Other Useful Devices.

This valuable 100-page book, bound in a handsome colored cover and filled with helpful reading matter and 146 clear illustrations, will be mailed to you for **one-half** the publishers price, if you accept our **Special Offer.** Act promptly and profit by these new ideas.

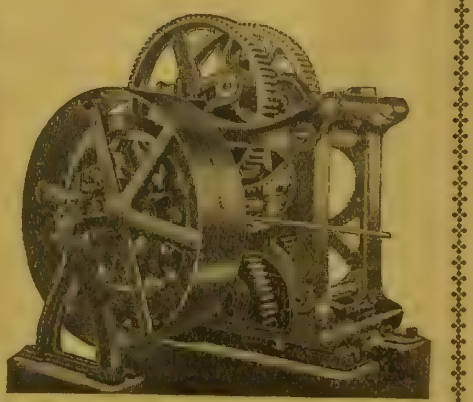
The Smooth Running Pomona Deep Well Pump



RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

THE WATSONVILLE AUDITORIUM

A FORTY-ACRE ORCHARD THAT PRODUCED 50,000 BOXES

The Great and Glorious Watsonville Apple Show

Scenes depicting the Horticultural Resources of the Pajaro Valley: the California Home of the Apple

An Appreciation.

As Emerson says, it is usually the improbable that always happens. The man who would have predicted ten years ago that California can hold two apple shows in one year, either of which would in importance and individual characteristics eclipse any similar event in this country, would only have caused a smile of incredulity from his listeners. Yet that very thing has happened in the year 1910. The Sebastopol fixture was strikingly individual from the fact that it was the greatest exhibition of Gravenstein apples ever shown in this country; the Watsonville apple show is distinctive from the fact that it exemplifies the Bellflower, Winter Pearman and Newtown Pippin varieties at their best. Yea, more, it shows a larger apple production over a limited area of country than is possible in any other apple growing section of the country. Allowing for these facts, the enterprising people of the Pajaro valley are not only to be commended for their enterprise, but they have in their splendid apple show done the state a real service in making known to the world that California can and does grow a high-grade quality of apple which is destined to travel hand in hand with the kingly orange and the queenly olive—adding new honors to our pomology as the greatest horticultural section of Uncle Samuel's farm. The Cultivator offers its felicitations to the Watsonville Apple Growers' Association. In the language of our only ex-president, the show was "bully."

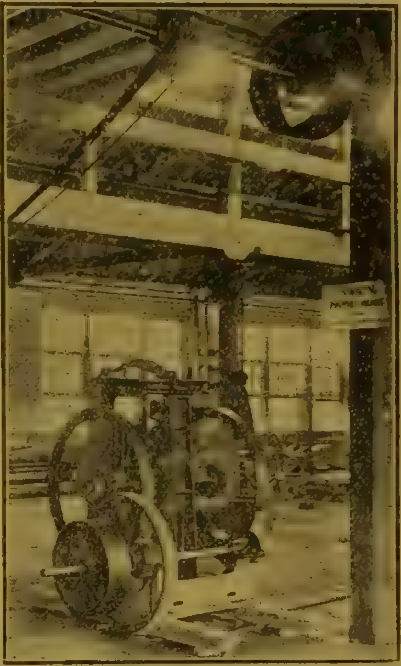
The Luitwieler Non-Pulsating Pumping System



Best For Deep Well and Irrigation Works

Pump Talk Continued:

The cam principle is now universally conceded to be the most perfect mechanism for lifting water from deep wells or against pressure. Luitwieler Pumps are the result of long years of experience and embody the perfection of the cam principle. The mechanism is balanced and all pumps are tested for smoothness of operation before leaving the factory.

The cut shown here is that of one of our 18 inch Double Geared Pumps, being driven by only a ½ inch belt lace. The weight of the revolving parts is 3200 pounds. This test is not possible with any other type of pressure pumping mechanism, not even the much advertised Triplex.

Luitwieler Pumps are in a class by themselves. 32 years of experience in Los Angeles with pumps and irrigation. Send for our catalogue.

Watsonville: the Land of the Money-Making Apple

Governor Gillett opens the mammoth Apple Show in a Blaze of Glory.— An event destined to attract Capital and Immigration.— The Pajaro valley. . . By C. B. Messenger

"By George, this has everything else beaten to a frazzle!" is a Rooseveltian expression which involuntarily springs to the lips at the first look at this show. It's simply great! It ought to have been called the State Apple Fair. Many counties are here with fine exhibits. There is Eldorado, Tuolumne, Butte, Mendocino, Modoc, Santa Clara, Los Angeles, San Luis Obispo, San Mateo, Sonoma and Siskiyou, and of course Santa Cruz and Monterey, who grow the pippins.

There are apples in carload exhibits—16 separate carlot entries—apples in boxes, thousands of boxes, apples on plates, a half a thousand of plates; apples built into houses, windmills, battleships, maps of continents, flags, cornucopias; apples which have been in cold storage a whole year; apples built into pies—one of them three feet in diameter and five inches thick—hot pies like mother made, just from the oven, served with cream and a glass of milk by the ladies; apples in jelly, apple sauce, apples canned, apples dried, apples wet—cider sweet, cider hard, cider vinegar—everything imaginable made of apples.

Makes Your Eyes Bulge.

The most impressive viewpoint is perhaps the balcony looking over the main pavilion, with its biggest stage in the state, 100x36 feet. But the most impressive exhibits are those in the carlot class. Six hundred boxes of commercial pack of apples in each entry, the facing layer having wraps removed and every one of the 21,600 apples which can be seen on the top layer of 600 boxes of four-tier apples, as near like its neighbor as two peas. The car exhibits are arranged in geat banks formed by building timber frame like an immense letter A, the exhibits being, of course, on both sides of the A. The A is over 15 feet high and 72 feet long.

One carlot will be Spitzenbergs, as red as a countryman's tie; next to them a car of Belles, conscious of their own beauty but blushing a bit because they are no redder; next, 600 boxes of Pippins, very pale, but feeling mighty well, thank you; then again the rich and deeper red of the Red Pearmain, with Smith's cider occasionally asking recognition. The red apple seems to be winning favor with later plantings.

What It Is.

But what is the Apple Show, and why? A proper question. Something over a year ago the Commercial League of Watsonville conceived the idea of such a show for the greatest apple producing section of the country. There were objections and difficulties. There was no building. The expense would be great. It would take a vast amount of labor. The kicker kicked and the knocker knocked, but a funeral was soon held over their remains. Everybody got busy and voted bonds to build the pavilion, a fine building 110x225 feet with wide balcony all about. Its construction was begun early in July and it is just completed. Its great floor space, including wide balconies, was soon found insufficient and three monster tents were erected alongside, so that over 75,000 square feet of exhibition floor space is available. Then the Apple Annual Association was organized with O. D. Stoesser, president; A. W. Cox, vice president; J. W. Kavanagh, secretary; Edward A. Hall, treasurer; J. A. Linscott, manager, and the following board of directors: O. D. Stoesser, A. W. Cox, J. E. Gardner, E. A. Hall, Hon. W. R. Porter, C. H. Rodgers, G. W. Sill, W. H. Benteen, J. A. Linscott, J. H. Thompson, R. H. Goodchild, Luke Scurich, Mateo Lettunich, F. A. Hihn, E. Steinhauser. The why of the show is given by the management as follows:

First, it was believed that by inviting competition, the local pack could be brought to a higher standard.

Second, it was recognized that a vast amount of publicity would be given the Pajaro Valley.

Third, the publicity thus gained is intended to suggest to many the idea of using the apple as food, where now, many, through ignorance or inappreciation of its food value, have excluded it from the every-day menu.

The rapidly increasing acreage of this very valuable and healthy fruit calls for a campaign of education among those who have not awakened to its value as a food product.

Besides the general good which it works, there are educational advantages to be derived from such an exhibition as is contemplated, since it admits of a comparison of methods in the manner of handling and packing the fruit that can not help but prove beneficial to all, since it may lead to even more economic methods.

Realized.

Now the realization of the hopes and the year's work is here. Watsonville has on her hobble skirt and fruit basket bonnet and the bunting is flung to the breeze.

As an indication of the universal interest I may mention that the churches united in a union of religious service in the Plaza on Sunday. The apple from Eden to the present was preached and sung about. If the Eve of Eden was as attractive as the Eves of today and had a Pajaro Valley apple, it is no wonder Adam couldn't stand up.

A Look In.

I arrived in town Sunday eve at 9:30. The pavilion was still lighted. I broke in at once and under the guidance of Mr. C. H. Rodgers, President of the Pajaro Valley Apple Growers' Association and of President O. D. Stoesser of the Apple Annual Association, enjoyed my first look. Yes, enjoyed it, notwithstanding wading through feet of litter, waste decorations, papers, lumber with nails inviting one to step on them and other refuse of the last stages of the preparation for a big show. Men and women were still busy. Scant attention was paid by the workers to interlopers, but occasionally one would drop on a box while wiping the perspiration from his face, which showed that dead tired look which is apt to come 'long toward midnight after days of strenuous work, and tell of his design and his hope to have it ready by the morning.

There are still scores of exhibits not yet touched. Some lessons from them next week with awards. The judges in quality classes are Geo. C. Roeding of Fresno, Geo. E. Rowe, editor Fruit Belt of Grand Rapids, Mich., and Adolph Levy of San Francisco. The judge of feature exhibits is J. A. Filcher of Sacramento. Judging has begun but will not end for two or three days.

Apple growers are here from all sections of the state and Watsonville is doing the hostess act royally.

Today, Monday, all is not complete, but tomorrow will see everything in apple pie order.

Governor's Day.

Today the Governor is here. The flags are unfurled and the bands are playing. One flag, especially, is honored and that is one presented by the Native Daughters to the city and run up on its staff on the top of the pavilion by the G. A. R. This ceremony followed a parade of a detachment of Naval Reserves, Grand Army, Native Daughters, Native Sons, the Mayor, city officials and other bodies escorting the Native Daughters who carried the magnificent flag made by their members.

The formal opening occurred in the evening with addresses by J. E. Gardner, Mayor P. K. Watters, Pesident O. D. Stoesser, Governor Gillett and C. C. Moore of San Francisco.

Some Features of the Exhibits.

The model of the high school building built by pupils of the school is a striking and excellent reproduction. The school is built mission style. The sides have a facing of evaporated apples with "tile" roof of Red Pearmains. The lawn with characteristic "Keep off the grass" signs is of Newtowns. The whole design is about 20x30 feet.

Next to it is "The kiss of the oceans," an immense design by the San Monte Fruit Co. The base is about 30x30 feet and perhaps three feet high. This base is topped with a rising slope of Red Pearmains. From this rises a Western hemisphere, 15 feet in diameter, done in apples, Canada in Bellflowers, United States in Red Pearmains—with, of course, the location of Watsonville indicated by a beautiful Bellflower, Mexico by Pippins, etc. The two oceans are of evaporated apples. Even the ocean currents are shown. The striking feature is two women's faces brought together in the act of kissing at the Panama canal. Considering the inflexible material in which it is done the result is remarkable.

McDonald & Sons patriotically produce a 13x26 foot flag in Red Pearmains and Newtowns. The effect is fine. While there is a Blue Pearmain, its blue hardly comes up to the blue of the flag, so blue tissue wraps were used.

The Japanese Association has a war vessel. It is perhaps 25 feet long, almost entirely of apples. It is named the Pajaro and the American flag floats from the place of honor.

The old Dutch windmill of the Loma Fruit Company is continually grinding out its "grist" a stream of apples. Its construction is likewise of apples.

Sebastopol, Sonoma County, comes down with large exhibits and striking ones. One feature from her own Gravenstein Apple Show is the "apple transformer," a mining appliance, "patent applied for," by the Sebastopol Association. It consists of a transformer into which apples are carried by a continuous belt and the result is a continuous flow of $20 gold pieces and gold nuggets from the spout of the machine. In the background is a view of Sonoma county orchards with apples being picked, carrying forcefully the idea of transforming from the soil to gold. Gravensteins which have been in cold storage for six weeks for this show are strong features of Sebastopol's exhibit.

The Red Men have a characteristic apple representation of an Indian tepee.

Apple blossom honey is represented by a combination of honey and apples worked into a large apple blossom.

Jones Bros. make a large display of vinegar bottled and barreled, as does the Heine & Kreiger Company Cider and Vinegar Works, also the Martinelli plant.

The Wm. McGowan orchard shows its riches by exhibiting an immense golden cornucopia from which is pouring a great stream of Bellflowers.

The Panama-Pacific Exposition people have a large booth and are everywhere present appealing for "A Solid West, San Francisco, 1915."

The background of the great stage is an immense eagle of Red Pearmains and other apples.

The Strongest Point.

The educational feature of the show is the commercial pack and the quality of the fruit exhibited. Especially is this true of the carlot exhibits. As a rule the quality is high, but the lesson of greater uniformity needed. Some have exercised greatest care; others are indifferent. This comparing of notes will make a better showing next year.

In the carlot class Sebastopol covers 200 miles with her gallant six hundred. They are beauties—all Spitzenbergs, perfect—almost. Messrs. Newcomb, Hale and Swan are in charge. Besides the six hundred, 856 other boxes are entered in other sections.

McDonald's car of Bellflowers is a beauty, uniform pack and of high grade.

Faraway Modoc comes down with a small exhibit. It was shipped 35 miles by stage, via narrow gauge to Reno, Nev., thence to Watsonville, slightly the worse for the long wear but still showing remarkable qualities, many apples weighing over a pound each. The Queen of the South is one of their finest apples, of fine texture and flavor. There were also Wolf Rivers, Soledad, Winter Banana (a coming favorite, by the way), Jonathans, Mammoth Black Twig, Blue Pearmains and Newtowns. In charge of G. E. Morrill.

Tuolumne will be heard from one of these days as an apple producer. In color, in polish, in crispness, in every way her exhibit is great. In size it is small. A good judge of apples said to me, "There's quality which will make the apple market take notice one of these days." The King Davids, so red that they were almost black are wonders. The Winter Bananas, Wolf Rivers and Red Bellflowers are in fine form. A little beauty is the Lady. It is very small, but so attractive in its shading and polish that all stopped to admire.

Alongside is Butte county with fine fruit, then Eldorado with entries in practically all classes.

TREES

Deciduous, Citrus and Ornamental Trees

Every one true to name. Well developed, strong, healthy roots. Grown in the finest soil and under perfect conditions.

Our System of Growing

and caring for all our trees and the superiority of the stock from which we propagate our trees are points you should consider when buying.

We have the largest and best stock on the coast, and our trees are all properly packed for shipping, so they will reach their destination in perfect condition.

Never Buy Cheap Trees

for such purchases are usually a great loss rather than a saving.

Everything in Trees, Fruit and Ornamental

There is not a desirable sort that will not be found in our list.

Grape Vines

We are the largest growers of raisin, wine and table grapes on the Pacific coast. Our vines are carefully graded. It is worth your while to figure with us.

Calimyrna Figs

The best and most profitable fig for all commercial purposes. It is the genuine Smyrna fig of commerce. We were the first to produce the Smyrna fig in the United States and to demonstrate its great commercial value here.

Burbank's New Creations

We are sole propagators and disseminators.

Palms and Roses

No better stock in the state than our field grown roses.

California Horticulture: The Fruit Growers' Guide
By Geo. C. Roeding

120 pages, 7¾ by 10¾. Beautiful lithographed cover. Profusely illustrated with half-tone engravings and color plates. It not only lists but describes 2000 varieties of trees and plants. Contains valuable suggestions on soil, preparation, planting, cultivating, irrigating and pruning. Price mailed, 25 cents.

PAID-UP CAPITAL $ 200.000.00

The Great Soil Convention

Ways and Means of Maintaining Soil Fertility in our Citrus and Deciduous Orchards.—Cover Crops.— What the Agricultural Experts say.

The appreciation of the necessity of bettering soil conditions was proved by the large attendance at the soil convention held in the city of Los Angeles last week. Last week's Cultivator referred to the opening sessions, and further, to the fact that the audiences were too large to be accommodated in the Chamber of Commerce lecture room. Therefore the sessions were transferred to the more commodious Blanchard Hall which seats 800 people, and practically all seats were occupied during every one of the five days.

Of course it is impossible to keep any convention strictly to the text, and wherever citrus growers are present, "What causes the greening of Valencias?" "What causes the splits of Navels?" "What causes curling of leaves?" "What will make orange trees bear profitably for a hundred years?" and a thousand others questions will crop up. The question box brought these and many others to light, but notwithstanding these divers queries the matter of bettering soil conditions was touched from practically every standpoint. The problem was considered, chemically and physically, but probably the greatest interest was accorded to Dr. Lipman's discussion from the bacteriological point of view. Of course Dr. King's great experience and knowledge of soil matters made him the strong drawing card and his lectures were listened to with most intense interest. As he said, he could only touch the outer edge of some of California's difficulties and did not wish to be considered as touching upon the subject in dogmatic terms. His efforts were largely along the line of the citrus grower's interests to show how clean cultivation is working against him. The chief aim of the grower should be to replace the humus which is burned out of the soil by clean cultivation. This is one of his most difficult problems, especially where he has to deal with large trees which make it almost impossible to grow green stuff between them. Dr. King insisted that the most economical and indeed the only practical way to return this lost humus to the soil was by green manuring. The state does not begin to produce enough stable manure to make it even a factor; besides it is too expensive.

Another difficulty confronting the grower is the shortage of water preventing the proper production of green manure crops. Unless there is sufficient water so that the green trees will not suffer because of the moisture taken up by the green manure crop, the loss from its growth may be greater than the gain.

Dr. King also impressed upon the growers that nitrate of soda must be used with the greatest caution, in fact, he discouraged its use to any extent because of the possibility of injury through the deposit of carbonate of soda left after the nitrogen is extracted by the roots. Some of the citrus men insisted that to set a full crop of oranges in the spring when natural soil conditions were unfavorable to the development of organic nitrates, a quick-acting nitrate must be used. Nitrate of lime, the new substance produced by an electrical pocess, was recommended by Dr. King, but instantly the growers suggested that the production was so limited that it would not begin to meet the requirements.

Best Subsoiler.

In the matter of subsoiling, Dr. King recommended a deep growing green manure plant. Alfalfa especially is one of his favorites. As he expressed it, no subsoil plow can be used which will go four feet into the soil, yet this is readily done by many of these deep-rooted legumes, with the result that as the roots decay air is carried down to the lower depths, thus making available much of the locked-up fertility. Air is as necessary to maintain and increase soil fertility as is the occasional addition of the actual elements needed. Indeed, it is more essential for it acts directly upon the bacteria which reduce these elements to a form available for the plant's needs.

One of the best aerators and subsoilers in the world is the deep rooting leguminous plant. Alfalfa, for instance, readily penetrates four or more feet, then as the root dries, air space is made far deeper than any subsoil plow can ever go.

Conservation of moisture was given much attention during the week. Dr. King called attention to the fact that growers as a rule, in considering the decadence of orange trees, failed to take account of the fact that an increased amount of water is required as the trees grow older. Many growers are giving the same amount of water to full bearing trees 15 to 20 years old as to trees that have been set out only two or three years. The doctor emphasized the fact that the amount of water required increases with the decrease of fertility, that is, it takes a greater amount of water to produce the same results if there is the least deficiency in any plant element, and this deficiency is sure to result unless the greatest care is taken to maintain the balance. Again, the constant reduction of humus decreases the capacity of the soil to absorb moisture, hence greater evaporation and leaching takes place. In enforcing this point, Dr. King mentioned the fact that 100 pounds of clean river sand will absorb 25 pounds of water, holding it only four hours, whereas the same amount of sand fully supplied with humus will absorb and hold indefinitely 200 pounds of water, or an increase of eight fold.

In the Orient.

Most interesting was Dr. King's description of methods in China and Japan, countries which for thousands of years have maintained a dense population. To do this they have found it essential to save every scrap and parcel of organic matter. This is usually composted with subsoil and then taken to the fields to be applied for the coming crop. No work is done in adding green manure or other fertilizer directly to the soil. The fields are required to produce from one to three crops every year and no time can be allowed for the soil to fit itself to newly applied fertilizer. Therefore it is composted with subsoil and this compost is carried directly on the backs of laborers to the fields, often to the extent of 70 tons to the acre. To every acre of desirable land Japan is supporting some three people and several animals. China is still more congested. While these extreme measures for maintenance of fertility may never be practiced in this country, they are an indication of some of the steps which should be followed.

The statement was made that improper handling of manures in this country resulted in the yearly loss of nitrogen, figuring on the basis of eight cents per pound, to the value of one hundred and forty million dollars.

In the matter of cultivation, Dr. King discouraged the use of planking or undue smoothing of the surface mulch. The maintenance of a deep mulch he did insist upon, but where it was made unduly fine it compacted too much and defeated the purpose for which it was maintained. There is less loss of moisture through a comparatively open soil than through one which is fined to an exceptional degree.

As to the time of applying barnyard manure, Dr. Lipman in referring to its beneficial effects in increasing the

ecomposing bacteria in the soil, said hat he would apply it any time of he year it could be secured. But alays get it under the soil as quickly s possible. When allowed to dry ut fresh manure loses many of its acteria. If cultivated into the soil s deeply as possible, fairly good reults are secured; still better if lowed under.

After discussing the beneficial and njurious bacteria in the soil, Dr. ipman touched at length upon the dvantages of green manuring and its bility to increase the beneficial baceria. This was of such practical nterest to the growers assembled hat a unanimous request was made hat Dr. Lipman give an additional ecture on the subject of green manre cops. This contained so much f value to many of our readers hat we give it almost in full in this ssue.

over Crops.

Prof. Norton gave several addresses n the subject of cover crops and the nanagement of citrus soils. In these e maintained that many orchardists vere overestimating the value seured through the application of green nanure crops. Especially did he beieve that the amounts of green tuff and humus secured were far ess than generally estimated. He eferred at length to facts given by im in an article in the Cultivator everal months ago, showing by most areful measurements and weighings hat but very few orchards have proluced the 20 to 25 tons of green stuff per acre which has been claimed. He nentioned one instance where an avrage crop showed 49,000 pounds of reen manure material on one acre. Prof. Norton felt that the Canadian ield pea or vetch were preferable o most of the legumes. He spoke of Melilotus Indica, which, while making an exceptionally tall growth, proluces less tonnage of green manure han some of the lower, more compact growing plants. As a humus producer barley is of exceptional vale, especially in orchards densely haded; but it only carries into the soil the nitrogen taken out by its growth, as is the case with all plants other than legumes.

The comparative loss of water on nulched ground and on that which s not mulched was made very emphatic by the following figures showng loss of water in 100 days. In celery peat lands which are naturally exceedingly rich in humus, without any mulch the loss was 5.48 inches; with one inch of mulch 3.24 inches; two inches of mulch 2.42 inches; three inches of mulch 2.2 inches; four inches of mulch 1.98 inches. On a rich loam soil in 100 days the loss of water without mulch was 6.39 inches; with one inch of mulch 3.51 inches; two inches of mulch 2.55 inches; three inches of mulch 2.38 inches; four inches of mulch 2.23 inches. On heavy clay land without any mulch the 100 day loss was 16.71 inches; with one inch of mulch 11.01 inches; two inches of mulch 9.08 inches; three inches of mulch 8.6 inches; four inches of mulch 7.74 inches. The word "inch" above used refers to the rainfall inch.

President Wheeler.

One of the interesting events of the session was an address by President Benjamin Ide Wheeler of the State University. He referred to the old days on the New Hampshire farm and said that every one of the farms in the state, he believed, sloped to the north and that the rock and other soil conditions made its study in that state a very different proposition from that in California. He expressed pleasure in noting the increase of human interest of the masses in importance of soil and country life conditions and deprecated the grasping of great bodies of land by large corporations which placed that land where there could be but little human interest in it. He alluded to the pleasure of ownership and the fact that the home makers of this country are its strength.

Some Resolutions.

There were fewer resolutions and less business connected with this convention than is usually the case. It was almost entirely an educational convention. The Secretary, Mr. W. E. Packard of the University force, had little to do other than to sign ticket receipts for the attendants.

One strong resolution unanimously adopted was one referring to the destruction of the Los Angeles Times building and the sacrificing of more than a score of lives by the explosion on the morning of Oct. 1. This outrage it has almost been proved was the result of criminality on the part of some one supposed to be opposed to the attitude of the Times on the labor question. The paper has consistently opposed the labor unions for years. The resolution unqualifiedly condemned the crime.

Only one or two motions were made, one called for the appointment of a resolution committee to consist of seven orchardists. This committee reported a series of resolutions in effect that: whereas, there is a great need for more available information, both general and specific, relative to the mechanical handling of our orchard soils, good and ill effects likely to follow the use of the various fertilizer mediums, cumulative effects of irrigation practices, proper and economical use of water for irrigation, and other vital problems too numerous to mention here, all of momentous significance, to this state;

Therefore be it resolved that it is the unanimous sense of this meeting that this convention has been wisely and opportunely called, and those responsible for it are hereby most heartily praised and commended therefore;

And be it further resolved that to Dr, King and to Dr. Hopkins we extend our especial appreciation for having come so far to give us the benefits of their full knowledge and experience in the handling and solving of these soil problems, and

Further resolved that this convention hereby declares its approval and heartily support of the work which the University of California is now doing both at Whittier, under the direction of Professor Smith, and at Riverside, under the direction of Professor Norton, and other points in the state, toward the investigation and solution of the problems enumerated above.

Whereas, having found in Dr. Lipman a capable, thorough and prudent scientist, one whose technical ability we not only admire, but also his splendid spirit; that we congratulate our state on securing Dr. Lipman and thank him for his contribution to this convention.

Whereas the citrus industry of the State of California and Arizona has been built up to its present magnitude on a virgin soil in an arid and semi-arid region, where nature has been able to store up during the past ages only enough plant food in the soil to maintain an orchard in vigorous condition but a few years without supplementary fertilizers and manures applied by the grower at great cost of labor and expense, and

Whereas every acre of land devoted to this great industry which represents an annual gross production in California alone of over 20,000,000 dollars, must be irrigated from a supply of water so meager that most rigid economy must be exercised in its conservation and use, and

Whereas these foregoing conditions coupled with the varied and manifold types of soil on which the citrus tree is growing, involve the horticulturist in a labyrinth of problems of soil physics, soil chemistry, soil bacteriology, so subtle and complex that means their equipment and education preclude more than the most superficial attempts at their scientific and practical solution; and

Whereas, the value of this work would greatly aid the grower of orchards of every description, whether deciduous or citrus, irrigated or unirrigated, not alone in California but throughout the entire West and South;

Therefore be it resolved, That our State University be urged in addition to its present able corps of investigators to secure at whatever cost of the ablest scientific men of the country to assist it in solving

some of our problems, and we hereby pledge ourselves to use every effort to secure special appropriations by our State Legislature to be used for this purpose and no other; and we urge upon the University of California the advisability of concentrating its funds and energy on as few lines of work as possible; that they may be prosecuted still more rapidly and more thoroughly to definite conclusion.

Another resolution referred to the unfortunate calling home of Dr. Hopkins to the bedside of his wife, expressing sympathy. Another extended the thanks of the convention to the Chamber of Commerce and others who had joined in making the convention such a success. A resolution was also passed recommending an increase in the chemistry force of the State University so that soil analysis might be conducted for the benefit of the farmers at a nominal cost, and finally, another was carried for the appointment of a legislative committee to present the matter of increasing the appropriation for experiment stations.

Cover Crops for Green Manuring

DR. C. P. LIPMAN.

The atmosphere is the source of our nitrogen supply. We live at the bottom of the great aerial ocean made up of four-fifths nitrogen and one-fifth oxygen, but in spite of the great tonnage of nitrogen over each acre of land, it is difficult to extract it and make it available for our use. Only the leguminous plants are able to take it up and transform it into an available supply. We also need some means of conserving moisture in the soil and bringing about proper air conditions. Therefore we need humus, and we want to see what use we can make of natural fertilizers before going to the trouble and expense of buying them.

Green Manures.

There are two classes of green manures. The non-leguminous, such as barley and rye, return plenty of humus to the soil, but no nitrogen except what they take out. The second class, the leguminous, such as the vetches and peas, not only add large tonnage of green material for production of humus, but add immense quantities of nitrogen from the atmosphere, providing they grow a plentiful supply of nodules. The non-leguminous green manures also have an effect on these nitrogen transforming bacteria through furnishing quantities of humus to the soil, because humus is the seat of the activities of all soil bacteria; the larger the supply of humus, the more plentiful and vigorous will be the soil bacteria. The leguminous crops, while possessing this quality consequent upon the formation of humus, to the same extent as the non-leguminous, in addition add nitrogen directly. One influences the transformation of nitrogen merely; the other influences transformation and fixation in the soil.

Humus.

The growth of plants depends upon: texture of soil, moisture and temperature, and the proportion of humus in the soil bears an important relation to all these, and this is why the addition of humus is such a paramount factor in agriculture. Humus is any organic material in the soil in process of decay. Anything that is organic in nature decaying in the soil will produce humus, and it is the substance which is the most tender and the substance which will most readily decompose which will give us the largest amounts of humus and will be most readily acted upon by soil bacteria in transforming it to our advantage.

In a light soil humus cements the soil particles and makes it capable of holding water better; in heavy soils it loosens it up and makes the water drain better and precludes the possibility of water-logged conditions. By regulating water supply in the soil temperature conditions are regulated. Water heats slowly and cools down slowly. Plants feel changes in temperature. Humus is the seat of all the far-reaching chemical activities that are going on in the soil through the agency of these soil organisms.

History of Cover Crops.

The old Romans found that they could grow better crops of potatoes on the Campagna on fields where clover had grown and been turned under. The fact they recognized without examining into reasons and by following this tradition they maintained a fairly good fertility. Due to other circumstances the Campagna at the present time is nothing but barren waste. After the retrogression of the Middle Ages, farmers again began to notice the effects of green manuring. Now experiment stations and practical growers are taking up a thorough study of the subject and have achieved notable results. As one instance may be mentioned the work of Prof. Shaw of the state experimental grounds at Ceres where he has, by the use of green manure on sandy soil, in four years time increased the yield of wheat from 14 to 44 bushels to the acre.

Especially on light sandy soils the use of green manures makes it hold water and makes the phosphoric acid and potash which plants take out of the soil combine with humus and thus makes them more available. It adds water holding capacity, soluble plant food and nitrogen. On clay soils it gives better aeration, and increases solubility of mineral constituents of soil, thus making them more available as plant food.

Objection to Green Manuring.

There is one serious objection to green manuring, especially on light soils. For every ton of dry material produced in the plant 300 tons of water are evaporated through the leaves. This means that a green manure crop on light sandy soil takes out considerable moisture and so takes moisture away from the trees. It may be the means of drying out the soil to such an extent that these trees will not produce a maximum crop. This is where the danger lies, and in order to control the matter we must know conditions and bear them in mind. If we think there is not sufficient moisture to decompose the material, take part of it out. Even supposing the trees may get sufficient water and the green manure crop may get sufficient water to make a good growth, there may be danger that the green manure crop and the trees have taken out so much moisture that when we attempt to turn the crop under there may not be sufficient moisture to allow of the activities of the bacteria that produce humus. To avoid this, the green manure crop must be put in as early as possible so as not to remove too much water and yet get as much green material as possible, while leaving enough moisture to plow under the green manure crop before it comes into blossom. The more succulent the material the more readily it decays. A green manure crop turned under in a light, sandy soil starts to decay; the supply of water gives out and great numbers of the bacteria are destroyed; then, even though sufficient water is supplied, the decay must be slow. This does not hold for the clay soil where we rather want to drain away the water.

The cow pea has been the farmers' bank in the cotton fields of the South, the velvet bean in Louisiana; crimson clover and the cow pea have been the standbys in Delaware, Maryland and New Jersey; in this state the grain farmers are beginning to recognize the fact that the Canadian field pea is a great boon. If we go at the matter of green manuring with intelligence we will not only increase the yield of our crops but improve their quality, but all the conditions must be considered and borne in mind.

We also have to consider the effect of green manure crops on succeeding

Harrow While You Plow

Put your ground in perfect condition for planting at one operation — by using the Racine Rotary Harrow Attachment for Plows. Readily attached to gang or sulky plow. Follows the furrow and cuts, packs and smooths the soil, keeping in moisture and leaving no ridges.

You know that the best time to harrow is immediately after the plow has turned the furrow—before the sun and wind have a chance to dry out the soil. That means — harrow while you plow. But you must get the right harrow if you want best results.

THE cutting blades of The Racine Rotary Harrow Attachment for Plows are curved. They cut throughout their full length—not simply at the point. Positively cannot clog or wind—self-cleaning. Bury the trash and litter well under the soil instead of dragging it around to the surface as do ordinary blades. If your dealer can't supply you, write direct to us for handsomely illustrated circular. Find out about this big labor-saver—today. A postal will do.

NORTHWESTERN-PACIFIC RAILROAD

Through Marin, Sonoma, Lake, Mendocino, and Humboldt Counties

Connecting with
The Scenic Auto Route through 100 miles of Redwood between Sherwood, Mendocino County, and Elinor, Humboldt County.

A virgin country full of possibilities for the Sightseer, Homeseeker, Investor, Vacationist and Sportsman. Forests of redwood. Miles of vine-covered hill-slopes and rolling acres. Hundreds of sparkling streams stocked with trout. Rich valley lands, with hop fields and orchards. Hills and mountains alive with game—quail, doves, deer and bear. All within easy and comfortable distance from San Francisco.

Full information on request.

J. J. Geary, G. P. and F. A.
Flood Building, San Francisco, Cal.

crops from a chemical standpoint. The percentage of nitrogen in the soil has been increased by green manuring in some instances from .02 to .17. Where large amounts of green manure are plowed under the intensity of decomposition in light sandy soil where the bacteria get plenty of air, is so great that nitrogen is added in such large quantities as to change the quality of the fruit and retard ripening.

It is possible to supply an excess of nitrogen on cereals, for instance. In some European sections where heavy green manuring has been practiced the wheat is inclined to lodge.

Tree and Shrub Fruits

EXPERIENCE IN WALNUT CULTURE.

Something over twenty years ago I bought from the late Mr. John Rock, nurseryman, about two dozen walnut trees, of the Praeparturien variety. These were seedlings—differing much in shape, size and quality of fruit, as also in time of blooming. They were all fairly good growers and early, abundant bearers; in fact, they had so much of this latter quality that I wished often they would not set so much fruit.

Of later years, however, the majority suffered from some kind of sunburn, which injured the nuts more or less and made them unsalable.

About fifteen years ago I received some more walnut trees from the same gentleman. Among this lot were two varieties grafted on black walnut; these trees sometimes throw out sucktrs from the original stock. These trees are very vigorous and healthy; as to the time of blooming they are the latest I have on my place or have seen anywhere else, and though they are planted in the "warm belt," in which late frosts are unknown, they are nevertheless, unsatisfactory bearers.

As to the quality of the nuts I wish no better, and from the assured fact that they are grafted on black walnut stocks, I fear no disease of any kind.

The labels of these trees have got lost, yet I have good reason to believe one variety is the Mayette and the other is the Franquette. The nuts do not grow quite so large on my place as I have seen on another in the valley, where the soil is richer and deeper, but the principal trouble with my trees I am now fully convinced is the fact that the catkins or male blossoms come out earlier than the pistillate or female blossoms.

Male Blossoms Earlier.

I also have observed that on most all late-blooming varieties the male blossoms came out not only earlier than the pistillates, but are rather scarce in numbers. Verily, I have at times wondered, where did the pollen come from when seeing the embryo of the pistillates growing into perfect nuts and all the catkins lying withered on the ground.

Looking around this last blooming season to remedy this unpleasant condition, I observed the behavior of many trees growing along the different roads when I was driving to town and I must say that I have not seen a single tree of the many varieties of English walnuts which would represent an ideal tree capable of furnishing plenty of pollen at the time when mine are in bloom.

But when I had failed so far in finding the proper tree amongst the English, I found myself agreeably surprised in learning that nearly all the black California walnut trees are very late in blooming, just in time for my Mayettes and Franquettes, and the further fact is that these black walnut trees have not only a great many catkins, but also an enormous quantity of pollen.

That I have singled out of these many blacks, one in particular from which I will request the owner for some scions to graft in the top of mine, I need not say.

Of course this is only to remedy a fault of old established trees. Should the defect of these varieties be more extended then a more radical remedy would be to grow a new variety (hybrid) from nuts obtained according to this proposed method.

From what I have learned in another line of somewhat similar difficulties, I am fully convinced that even a small percentage of blood of black California walnuts mingled with a Mayette or Franquette will do away with such bothersome, ridiculous work as the grafting on the root and also the grafting in the top.—Wm. Pfeffer in Mercury-Herald.

GYPSUM.

Answering a query as to the effect of gypsum on cultures of bacteria in soil, also as to its action on soils, the Country Gentleman says:

"Gypsum is known to facilitate the decomposition of humus and fresh vegetables and animal matter in the soil. It also serves to increase the available potash. In these respects it resembles lime, but differs essentially from the latter in that it cannot neutralize acid. Hence, if the soil is sour, or is likely to become sour, gypsum cannot be depended on to correct the defect. A hundred years ago the use of gypsum was common along the Atlantic Coast. The results secured by many farmers indicate that applications of one or two bushels of gypsum per acre in conjunction with lime often increased the action of the latter. For this reason no objection could be raised to the use of smaller amounts of gypsum together with lime. But whether gypsum be used or not, lime must be applied in liberal amounts on all humid soils, except those derived from limestone (and occasionally even on these) for the best results with alfalfa. Gypsum will not injure the cultures of bacteria used for inoculation of alfalfa and of other legumes."

THE APPLE AND THE BOY.

Now that the apple is a fruit well in the spot light before California growers and packers, we feel quite sure the following pertinent reference to this fruit from the pen of John Burroughs will find a response with all of our readers:

"The boy is indeed the true apple-eater, and is not to be questioned how he came by the fruit with which his pockets are filled. . . . Whether he be full of meat or empty of meat, he wants the apple just the same. Before meal or after meal, it never comes amiss. The farm-boy munches apples all day long. He has nests of them in the hay-mow, mellowing, to which he makes frequent visits.

"The apple is indeed the fruit of youth. As we grow old we crave apples less. It is an ominous sign. When you are ashamed to be seen eating them on the street; when you can carry them in your pocket and your hand not constantly find its way to them; when your neighbor has apples and you have none, and you make no nocturnal visits to his orchard; when your lunch-basket is without them and you can pass a winter's night by the fireside with no thought of the fruit at your elbow, then be assured you are no longer a boy."

We suggest to our apple growing friends that they adopt the above as a text and use it on all occasions in the disposition of their product.

Trim a little every year, rather than much in any one year.

SPECIAL NOTICE TO MELON GROWERS!
Plant your cover crop now and double your yield of melons. Sow
Vetch, Fenugreek, Canadian Field Peas, Burr Clover

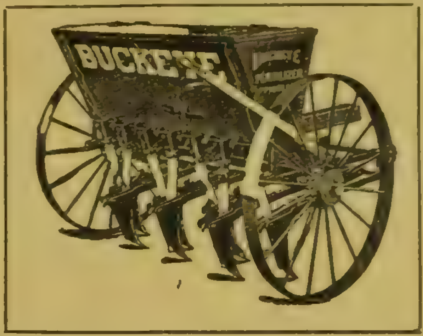
If you are in the market for any of the above for cover crop, write us for prices, stating quantity, and we will make you close prices.

We also have several tons of small Yorkshire Hero peas that we screened out of our seed stock which we are offering at $3.00 per cwt. If you would sow them in your orchard you could harvest a crop of green peas and get a fancy price in the San Francisco market and also fertilize the orchard.

Now is the time to plant onion and cabbage seed. We can furnish them in any quantity.

Aggeler & Musser Seed Company
113-115 N. Main St. Los Angeles, California

For Use in Orange Groves and Vineyards
there is nothing better than the
Buckeye Fertilizer Drill
Set of Plates Furnished FREE with
Each New Drill if Desired
For Sowing Vetch and Peas



We have sold a great many carloads of these drills in Southern California and the Buckeye is now recognized by orange growers and fertilizer men as the best drill made for handling commercial fertilizer. Its low wheels, proper sized box, and large feed openings giving great capacity when desired, make it especially adapted to orchard use. This drill also made to successfully handle tankage.

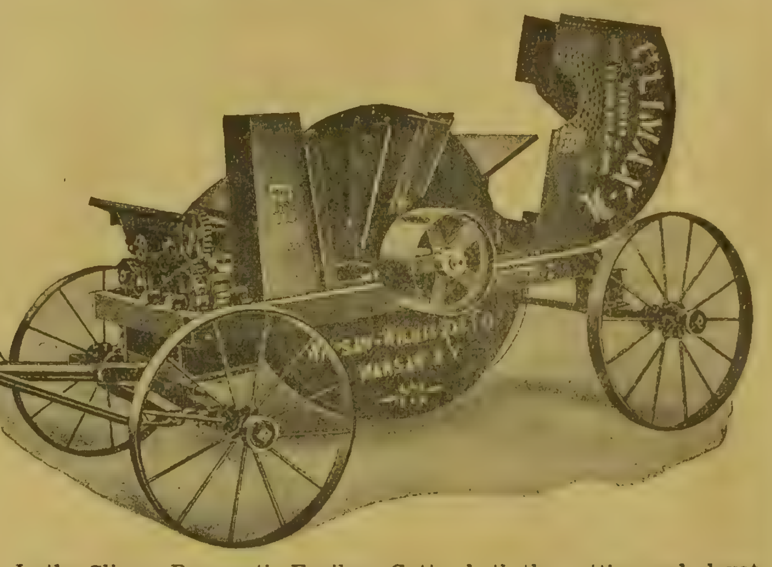
Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 5 to 50 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

O. J. Weber Co. 225-227-229 East Sixth Street

Clip Your Horses Yourself

Stop paying high charges for work that you, or any man or boy, can do. There's no need to employ experts to clip your horses when you can clip them **yourself better, quicker, cleaner, safer and cheaper** with a

Stewart No. 1 Ball Bearing Horse Clipping Machine

It's an economy for the man who owns one or more horses. For, with a **STEWART**, there are no delays. The machine is **always ready** for use. Horses can be clipped more frequently and at **Regular Intervals**. The **STEWART** is *the* machine that lasts indefinitely and gives good service *all* the time. It never requires attention, and runs practically without friction or wear. A tremendous speed of the knives is obtained by slowly turning the handle—and a boy can turn the handle. (Another boy can clip the horse.) **Complete for $8.50.**

The price is for the machine ready to begin clipping horses with. It includes six feet of flexible shaft, the famous Stewart Clipping Knife and a liberal guarantee. Get one at your dealer's. If not there, write us.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

ON THE RANCH.

By Mrs. M. E. Sherman.

The warm days and cool nights are hastening the corn along to ripeness. The deep shadows that are dissolved in the early morning as the sun strengthens, add to the beauty of the country. The vines are hanging full of the deep red grapes and on the olive trees the berries are turning red. All vegetation is hastening to ripen fruit and seeds before the winter long sleep comes on to rest the tired ones. Only the orange trees seem to keep awake and not need the long rest of the peaches and pears. It is a wonderful time of beauty and peace, the closing of the long summer season. Already the hazy shadows are turning blue and as the days shorten last well into the morning.

Peace.

The Press has announced that California is more like Palestine than any other country. How long they have been in discovering this; Any Bible reader knew that on a Fresno ranch one could quote many texts descriptive of the every day look of things. It seems to me that the Californians ought to be more devout than they are, living as they do among the very living things that inspired so many Bible descriptions. Peace on the ranch is usually badly broken up by Sunday joy riders howling around. I presume they consider it singing! The autos are proving a nuisance as they are run recklessly around the house and buildings. The auto is convenient to the farmer to get into town quickly, but it is also convenient for the town people to run longer distances into the country. Do not understand that there are not more respectable people driving autos than disreputable ones, but the good folks move along and attend to their own business, while the rest come out to make the country suffer the things they could not do unmolested in towns. We are reaching the stage where locked gates will be placed on the ranch at night to keep off these unwelcome intruders.

Cutting Fences.

The main travelled roads are left by those intruders and when they run off into side meadows and find the land fenced, they cut their way or tear down the fences to escape into the highroads by a short cut. The last people that tried that got fooled badly by finding a deep ditch with water between them and the highway. After tearing down the fence in three places they gave up and came out the way they had entered. In the meantime a neighbor in the early morning observed the torn-out fence and telephoned, or the cattle would have been into the vineyards around us doing mischief. Cows dearly love grapes and can get away with a great many in the course of a hour if unrestrained of their liberty. The grapes seem not to go very well on their stomachs, as they sometimes cause impaction and result in the death of the cow.

Corn.

The corn crop this year is much less than usual on the ranch as we had to cut and feed much of it green on account of the falling off of the usual water supply in the ditch in August. The one heavy field that was left has done well and is about ready for the silo. It may be held back until we can secure the alfalfa cutting from a neighbor to finish filling. It pays us well to buy up the green alfalfa and to fill up all the spare places. This enables us to keep a few more cows and to have a little more manure to spread out on the land. How everything loves silage! The two old horses, Topsy and Anna, now rather thin in their old age, will fatten out into renewed youth when the mangers are filled with silage The cows will then require no grain. (To keep them going while on green corn we have to feed a little grain right along to the fresh ones.) The milk flows from their udders when they are coming into the barn now and when the silage comes it will probably be a case of having to milk three times a day instead of twice.

Ensilage.

The dream of the dairyman of full pail and big creamery checks is possible all the time when silage is the principal feed of the herd. I went over the entire cow herd yesterday as they stood in their stalls to see how the week past had used them in the way of feed. They had lost a trifle in weight though they had had rolled barley and dried brewers grains twice a day. The green cut alfalfa in their mangers was soft and succulent. What did they lack? Some long dry stuff, as their feed was going through them too promptly to make flesh. The mangers in the yard were filled this morning with some coarse, rather woody alfalfa that was saved for this very purpose to fill in its own niche. These cows will then be able to retain the food longer in their stomachs and receive more benefit from it The fact is that it requires much less well assimilated food to produce the same amount of nourishment than a food that is passed through the animal hastily. The Fletcherizing of the human family has proven this to be a fact. A small amount of food well chewed to mix with the saliva has the same effect as double the amount of food when taken hastily and not mixed with the natural juices provided for this purpose. The cows cannot regurgitate all their food well unless they have plenty of long coarse stuff to bring it up into a good cud. When the cows are doing well in the way of digestion, their sides should be full when they are just fed. No matter how strong the dairy type is in them they will be the better for full stomachs though the backs and the hips can never be filled out completely. The dairy line in a young cow is often only developed on the lower side. The udder is looked at for its shapeliness and as to the size of the milk veins. The face of the young heifer with her first calf takes on a sweeter expression when she comes into the herd as a new member full of energy. Sometimes the old cow surprises one, too. We have one old one that was coddled through last winter as a matter of sentiment, that surprised us last week by presenting us with a fine little heifer calf. The boys are calling it Margaret's Surprise, so I suppose it will go on the books under that name. It is very hard to give up the old animals on the ranch—to sell them to be ill used. I have two old horses and this old cow and a dog eighteen years old on hand to coddle. No, there is no

Give Your Cows a Square Deal

What would you think of a farmer who would thresh his grain with a machine that would carry off one bushel in every four with the chaff?

Wouldn't think much of his judgment, would you?

Then what do you think of a man who still skims milk by the old-fashioned "setting" system and loses about one pound of cream in every four?

Any creameryman will tell you that with a

De Laval Cream Separator

you can get as much cream from three cows as you can from four by any gravity setting process, anl besides, you will have nice, fresh, sweet milk to feed to your calves.

Ask us to prove it. Try a DE LAVAL at our expense. Write for particulars about our free trial plan.

ALIFORNIA'S MILK STANDARDS.

The California statute regulating ilk standards requires that 3 per ent shall be fat and 8.5 total solids. kim milk must contain 9.25 of solids d condensed milk 24.5 solids, of hich 27.5 is fat.

Municipal regulations of inspected iries usually require 3.5 or 3.4 of fat d inspectors of the different cities and firm for these standards, while any milk dealers are equally deterined in favor of 3 per cent as a miniium. These dealers represent the ceptional herds, in which Holsteins edominate, while possibly 80 per nt of dairy herds of the state used the milk trade produce an average 3.6 of fat and seldom under 3.5.

The Milk Commission of the San ancisco Medical Society requires 3.5 r cent and in its report on certified ilk, for 1909, the three dairies supplyg certified milk have an average of 7 fat and 8.7 solids The range was follows: Timm's dairy, Dixon, 3.2 4.7; Ideal, San Anselmo, 3.3 to 4.5; arren, Menlo, 2.7 to 5.1 The latter s had its certificate withdrawn. Perps a basis that would fix the miniim of 3 per cent from November to May and 3.5 from May to November would pave the way to the higher basis. It is a hardship to convict a man when his cows are fresh and giving the lower test, especially as he makes up for it while they are drying up in the fall.

There ought to be some common-sense basis on which the inspectors and dealers can agree and a conference between the two interests should be had, before the Legislature meets, as the municipal health boards have determined to break the present state law and there is no evidence that the owners of large herds of Holsteins and the dealers handling this class of milk are willing to concede a higher minimum than 3 per cent.—Western Creamery.

BARB WIRE CUTS.

More good horses have been ruined or blemished from the introduction of barb wire than from any other cause. When a horse gets his foot over a wire, instead of trying to avoid injury to the leg, the animal will struggle violently.

The wounds made by barb wire are always infected, so that healing takes place by the formation of granulation tissue. This being the case the wound sometimes heals too fast and a large tumor forms. The skin cannot grow over this tumor, and a raw, bleeding surface remains. The common locations of barb wire cuts are in front of the hockjoint, below the fetlock, along the cannon bone and across the breast. Wire cuts in front of the hock-joint are often very serious, the wound usually extending through the tendons and into the joint.

Careful Treatment.

In treating a wire cut, the wound should be kept absolutely clean and exposed to the air and sunshine. When the wound starts to heal, it should not be irritated by washing the raw surface or by removing scabs which have formed. Liquid disinfectants are best applied by allowing the fluid to be poured onto the raw surface, not by rubbing the wound with cotton saturated with the disinfectant.

Follow the disinfection by covering the wound wtih some good healing powder that is both astringent and disinfectant. Should the wound heal too fast, use some form of caustic to remove the excessive granulation tissue.—C. L. Barnes, Colorado Agricultural College.

MILKING MACHINE EXPERIMENTS.

In a late bulletin issued by the agricultural department of the Danish government, N. O. Hoffman-Bang gives some interesting data: The experiments were conducted with the L.-K.-Gillie milking machine on the Ourupgaard dairy farm during the seasons 1907-8 and 1908-9. Four uniform lots of 10 cows and 4 heifers each were used in the first season's experiments, when two of the lots were milked by machine and two by hand during an experimental period of about 3½ months. One of the hand-milked lots was stripped by hand after having been machine-milked, while this was not done wtih the other lot until after 42 days from the beginning of the period when it was deemed necessary to do so on account of the decrease in the milk yield of the cows. In the second season's experiments 4 lots of 14 head each were formed, namely, 2 of aged cows and 2 of heifers; one of each of these was milked by hand and the other by machine. In this experiment the new Thule teat cup was used, which seemed to render is unnecessary to strip the cows after they had been machine-milked.

The results of the experiments showed that nearly the same amounts of milk were, in general, obtained by either method of milking. For the aged cows, however, hand milking appeared to give a small increase over machine milking, while the opposite was true for the heifers. The chemical composition of the milk was not affected by the method of milking adopted. No special difficulties were met in operating the machine, and the cows stood quietly during the process of milking. The great difference in the ease of milking different cows and heifers by hand was found to be not nearly so pronounced in machine milking.

The results obtained indicate that one man with two machines (milking 4 cows) can do about the same work as three hand-milkers, and can milk 50 to 60 cows in 2 to 2½ hours. The bacteriological examinations of the milk drawn by the machine and by hand showed that machine-drawn milk may have a lower bacterial content than that of milk drawn by hand if both the machine and the teats of the cows are kept scrupulously clean. Care in keeping the teats clean is especially important from the fact that bacteria in dirt adhering to the teats are likely to be sucked into the milk pail with the air and will tend largely to increase the bacterial content of the milk.

Sugar Beet Pulp takes place of green grass as a milk producer. 40c per ton. Los Angeles Sugar Factory.

GRAIN TO PASTURING HOGS.

A writer in the Farmers Star urges the advisability of graining hogs in pasture. He says:

"Twenty-five years of pasturing of all ages on alfalfa has proven to me conclusively that a fourth to a half grain ration while they are on such pasture will produce greater growth per day when they are kept in dry lots and fed on full rations of corn. Hogs will maintain a reasonable growth, but not fatten enough for market on alfalfa pasture alone, therefore it is best to feed them some grain while running on green alfalfa in order to make them profitable.

"If it is desired to full-feed hogs they will make a rapid fattening growth from increasing the grain ration while they are on the pasture, and with this grain and alfalfa combination the meat will be nearly as firm as that of the hogs kept in the dry lot and fed nothing but grain. I find no distinction on the market between alfalfa-fed swine and those purely grain fed and they sell price and price alike. The general health of the alfalfa-fed hog is equal to that of those maintained on any other feed and they are prolific."

ROPY MILK.

There are various ideas afloat among men as to the cause of ropy milk. Farmers in general think it is due to some condition of the cow, inflammation in the udder or the like. But scientific investigations say, not so.

The germ that causes ropy milk, B lactis viscosus, finds its natural habitat in water. It will flourish in ice cold water but it grows with difficulty at blood heat, says Prof. Ward, which proves conclusively that it is not the result of disease in the cow. Starting with the proved fact that the disease originates in water, here are some of the causes as stated by Prof. Ward in his book, "Pure Milk and Public Health."

Cows wading in muddy sloughs and the germs falling from the body of the cow into the milk pail; foul stables, where this trouble exists; the organisms are found in the floor dust of milk room; infected water used for cooling milk in cans; the corrugated milk cooler may have a leak whereby the water is mixed with the milk.

The bad practice of merely rinsing the milk utensils at night in cold water and not scalding them out is another cause and a quite frequent cause of bad milk.—Hoard's Dairyman.

Plant Easter Lilies Now!

Wouldn't you like some beautiful Easter Lilies in your garden in the early spring? Or a profusion of shimmering Daffodils? Or dainty Freesias? Or the early white Gladiolus?

Then send for a few of our Bulbs and plant them *now*.

In the hot house they will flower by Christmas. In the garden or window boxes they will bloom in spring.

We carry a vast assortment of Bulbs grown for us in Holland, France, Japan and China, the best selected, strongest, most hardy bulbs from gardens chosen from thousands in those various countries.

Easter Lilies ....$1.50 per doz.
Narcissus, Paper White ....30c per doz., $1.75 per 100
Daffodils, Trumpet Major......35c " " 2.50 " "
By mail 12c per dozen extra.
Freesias (post-paid)...........15c per doz., $1.25 per 100
Gladiolus, the Bride (post-paid) 25c " " 1.50 " "
Chinese Sacred Lilies........$1.00 doz., postage 35c doz. extra

Morse Special Bulb Assortment consisting of 130 of the finest bulbs in our stock................**$2.10**
(Postage 40c extra)

Send for our complete fall catalog of bulbs mailed free to any address on request.

The Ornamental Garden

THIS MONTH.

This is bulb-planting month, and nearly all which have not gone into the ground should be planted before the end of the month. Especially plant Easter lilies, freesias, hyacinths, tulips, anemones, tritonia and Watsonias. Gladiolus bulbs which were taken out early in the season and are now dried off, may be planted also. Amaryllis may de divided and reset.

Shasta daisies may be reset, although they perhaps will do as well from later plantings. Pansy plants, lobelia, carnations, scarlet flax, stocks, and phlox, may all be set out at this time, although if the plants can not be had from the earlier planted seeds, the seed may be planted now. Sweet peas for early blossoming should be planted now.

The lawn will be benefited by the application of well-rotted manure, or better perhaps, commercial fertilizer which will carry no weed seed. This will help somewhat in preventing browning of the grass during the colder months. The next few months will be a good time to plant new lawns also. While the seed does not start quite so quickly as in the springtime, it gets a firm hold and makes a more perfect sward before the Bermuda becomes established.

AMERICAN FLOWER GARDEN.

"What is a garden? It is man's report of the earth at her best. It is earth emancipated from the commonplace. It is man's love of loveliness carried to excess—man's craving for the ideal grown to a fine lunacy. It is piquant wonderment; culminated beauty that, for all its telling and select items, can still contrive to look natural, debonair, native to its place."
—John D. Sedding.

How to produce "man's report of earth at her best" is the aim of the American Flower Garden by Neltje Blanhcan, published by Doubleday, Page & Co., N. Y. The price is five dollars, but it is an exquisite production. It touches upon the partnership between nature and art, practical garden work, formal gardening, old fashioned gardens, wild gardens, water gardens, trees, shrubs, perennials, annuals and so on to garden furniture. To give an idea of the practical every day suggestions it contains we quote:

"And since the first cost of the garden that is planted on naturalistic lines is the only cost beyond its easy maintenance, every cottager in this country, as in England, may hope to have his dooryard gay with hardy perennials, and a few shrubs and vines, at least; and oh, how sadly our working people's most unlovely homes need cheerful little gardens about them!

"Handkerchiefs, slippers and neckties are not the only useful Christmas presents. Why do we so rarely give trees, shrubs, bulbs, vines and perennial flowers to our friends? Many a large steamer that leaves the port of New York carries an enormous value of perishable cut flowers heaped up in its dining saloon, and these are often more of a nuisance than a pleasure to the voyagers. Do friends care any less for one another because they stay at home?

"One bride I know received a checque to cover the cost of making and planting a garden around her new home, and it is certain that all the cut glass and bric-a-brac she received will not give her a tithe of the pleasure during the rest of her life. For a wooden wedding present a young couple who had recently moved into a raw, new place, received two maples that taxed the capacity of the nearest nurseryman's big tree movers. Another couple give each other living Christmas trees every year. Their young daughter, when asked by her father to choose her own Christmas present, handed him a list of hardy hybrid tea roses. These could not be enjoyed except in her mind's eye until the following spring, it is true, but by that time she had studied how to care for them and now there is not a morning from June until frost when she cannot pick a bud for her father's buttonhole and roses for the library table."

The book can be supplied by the Cultivator business office.

GARDEN IN SHADE.

HERE are many places where shade makes it impossible to grow sun-loving plants. If this shade is a matter which cannot be got rid of we must either give the location over to grass or fill it up with such plants as flourish under the conditions which prevail there. There are many such plants—and some of them good ones—you will soon find out if you begin to investigate. Indeed, it is possible to make the shady garden quite as attractive as the sunny garden if one goes at it the right way.

Among cultivated plants the iris is one that succeeds well in the shade. So is the dicentra, with its long, curving racemes of drooping pink and white flowers. The lily of the valley does much better in shade than in sunshine. The aquilegias bloom well there, as do the hebaceous spireas.

Among the annuals that can be grown to advantage are nemophila, gypsophila and wild cucumber. With the latter most beautiful effects are secured by planting where it can clamber over bushes and trees to suit itself, if you want it to do itself justice.

But the most beautiful of all plants for the shady garden are found among the fields and forests. Here trilliums and bloodroot and erythroniums and hepaticas can be made to grow quite as satisfactorily as in their native haunts if you will furnish them some of the soil of the woods to grow in. This they must have or they will refuse to become domesticated. Here thalictrum, better known as meadow rue, and one of our most beautiful plants, with foliage almost as fine as that of a fern, and flowers dainty and delicate enough for a fairy garden will grow into great clumps, and furnish you with material for most charming decorations of table or parlor. Blue and white and yellow violets will increase in quantity year by year, and Solomon's seal will grow and spread until you have to restrict it to certain limits.

Here is the place for a collection of ferns. You may have one that will be a constant source of delight to you with little trouble. First of all, a trip to the woods for earth in which to plant them. Remove some of the old soil and put the woods earth in its place. Then go in search of plants with which to fill it. Take with you a large basket and a trowel to dig your plants with. Do not take the plants, as you will be tempted to do, thinking that they will produce an immediate effect. Most of them have such large roots that you cannot lift them without seriously disturbing them, and root disturbance means the loss of nearly every developed frond. Be satisfied with the little plants whose roots are so small that you can lift them in your basket, and keep the soil about them moist by frequent sprinkling.

Ferns adapt themselves to new conditons much more readily than most persons imagine. While it is important that the native soil should be used with them at first they soon become so much at home in their new quarters that they reach out their roots beyond the soil you have provided for them and take possession of the ordinary soil.

The foliage of domesticated ferns lasts considerably longer, when cut than that of the fern growing in its wild state. It is probably accounted for by the fact that the domesticate plants are, as a general thing, more fully exposed to the action of the air and wind than those in more sheltered places, also by the lack of moisture in the air, which is always excessive in woodland places.—Ruth Ericson in Coleman's Rural.

Garden and Field Crops

THIS MONTH.

Plant peas, bush beans, beets, carrots, cabbage, lettuce, radishes, parsley, onion sets and rhubarb roots. It must be borne in mind that the subsoil is thoroughly dried after the months of drouth, and heavy irrigation should precede any planting. The indifferent watering of ground is the cause of many failures in garden work. The loss is in two directions. The sun is yet high enough to take much from the surface and the attendant loss in the dry layers below requires a good supply of moisture for the seed so that the young shoots will reach through the surface soil. It is because of indifferent watering before planting that irrigation is necessary to bring the seed through the soil and the surface crusts over.

There are a few sections in the state where tomatoes may be transplanted this month. It is probably too late to plant the seed, but with care the vines will give holiday fruit. Some sections have succeeded in planting chiles and bell peppers at this time.

Portions of the garden not being used should be cleaned of all vines, leaves and rubbish, which may be burned, or if desired for composting, be sure to use in orchard or on other crops and not again in the same garden. The weeds and left-over vines from former garden work may carry with them fungous and insect troubles which will cause serious loss. A good deep ploughing which will put the ground in condition for receiving the early fall rains will prove profitable.

THE VITALITY OF POTATOES.

Is it a fact that potatoes must be bred from time to time by a man who understands the art in order that they may not run out? This is one of the disputed questions among those who have given the subject study. First, potatoes as usually grown are really cuttings; that is, they are grown from other potatoes planted whole or by cutting down to one or two eyes. They may even be grown from potato peelings that contain an eye or bud. Therefore they come under the general law of all cuttings, and it is a well-known fact, established by long experience, that fruit grown from buds or cuttings has less vitality than when reproduced from seedlings—that is, grown from seeds.

Varieties of potatoes originate from the seeds found in the balls on some varieties of potatoes in some seasons. Here again the analogy holds good. If we grow trees from the seeds of the apple, the stones of the peach or plum, we may have a wonderful variation of fruit from the same apple or pits from the same tree. The work of establishing a new variety of potatoes involves the gathering of a large number of these potato balls, washing out the seeds, planting them, cultivating them, until the quality of the tubers growing therefrom may be ascertained. Possibly one of a thousand may be worthy of further cultivation. These are cultivated until the proper size is developed, and when a really choice variety is secured in this way, it can be depended upon to reproduce itself from the potatoes for an indefinite number of years. We say indefinite, because much then depends on the cultivation, and especially upon the careful selection, of seed and subsequent cultivation, particularly if grown in a country not especially well calculated to develop the potato to its best.

Here again it sometimes happens, as in the case of the world-renowned Scotch and English varieties which Grubb recently brought over, that a potato that yields the most and is the hardiest is not by any means of the best quality. There seems to be a lack of hardiness in many of the really finest types of fruit and vegetables. Hardiness—in other words, the extreme vigor of stock, tree or vine—does not always, nor in fact generally, go with the highest quality. When a man gets hold of a really fine variety of potatoes he should under no circumstances plant small seed, or that for which there is no market; nor should he plant the extremely large seed. Extremes of size either one way or the other should be avoided in the selection of all kinds of corn, for example, or in selecting breeding stock for the farm.

A good variety of potatoes may be made to last a great deal longer if the farmer in selecting a few potatoes for seed will go through his field and select those hills or rows most resistant to fungous diseases, whether on plant or fruit. Fungous diseases take hold of the weaklings. They are to potatoes what lice are to livestock, always abundant on those less able to resist their attacks. When a potato begins to weaken fungous diseases of various kinds take hold of it, just as smut and rust do on a variety of grain that is running out—in other words, losing vitality.—Field and Farm.

THE SOY BEAN.

There is a wonderful increase of interest in the soy bean, both in this country and Europe. It is one of the staple products of Eastern Asia and especially of Manchuria, where it is used as food for man and beast and is pressed for oil, which makes a residue of bean cake, for which Manchurian merchants are making energetic efforts to find markets. Consul H. L. Washington of Liverpool, England, writes:

"The first complete cargo of soy beans that arrived in the United Kingdom reached Liverpool February 14, 1909, and the interest in this new industry has grown apace since then, experiments being made in various other parts of England as well as Liverpool that range from a blend of soya flour, made by an expert Liverpool baker with flour and with meal, about one-fifth for mixing with flour and one-sixth for meal, to a soya dog biscuit.

"The blending of soy flour above referred to is desirable by reason of its demonstrated food value. In albuminoids soya beans are stated to be nearly three times as rich as oats and wheat and possessed of more fiber and ash. A few German millers are reported to have mixed soya and rye flour in experiments in the making of a black bread of that country, and local millers here are experimenting with a blend to improve brown bread.

"A vegetable cheese is known to be produced from the casein that the bean contains, but this has not advanced from the experimental to the commercial stage.

"It is reported that one or two important Liverpool merchants have sent their own investigators to Manchuria to study the products of that country, chiefly the soya bean. It is also stated that one of the large shipowners of Liverpool contemplates the introduction of the soya bean into West Africa, where soil and labor conditions are thought to be peculiarly favorable to the growth of good crops. This enterprise is cited as a parallel to the British cotton growing movement at its inception, and some measure of the same success is confidently predicted for it.—S. F. Chronicle.

THE TOMATO IN THE IMPERIAL VALLEY.

From the Brawley News we learn that winter tomato culture is not without its attractions in that region. The long extended growing season is not only especially adapted for the successful maturing of ripe tomatoes for the late fall and holiday trade, but here we are, situated within eight hours travel of the greatest tourist city in America. Los Angeles has more first-class hotels than any other city double her population in the United States. These hotels, the great majority of which cater only to those "after the manner born," require daily, tons and tons of green garden produce, for which they are willing to pay fancy prices.

Canvas Goods

IN no country in the world is Canvas used to a greater extent or to better advantage than in California.

We handle the best—Living, Lemon Curing and Fumigating Tents, Irrigating Hose, Picking Sheets, Fruit Picking Bags, Stack Covers, Tarpaulins, Canvas, Khaki and Army Duck Suits, etc.

The Song of the Apple

This week the Pajaro Valley is certainly in the spot light with its Watsonville apple show, full particulars of which The Cultivator presents elsewhere direct from its own correspondent on the ground. Nothing that has ever been attempted in a deciduous fruit exhibition can equal the magnitude and beauty of this effort, the entire display staging no less than 25 carloads of fruit, nearly all of which is high-grade. The only negative note in the song of the apple is here and there a want of careful selection and perfect packing—imperfect specimens carelessly handled often marring what would otherwise have been an exhibit almost faultless. On the whole, however, it is an effort that the California fruit interests can be proud of, and no division more so than the apple growers.

And well it may be so, for the apple finds nowhere else a climate and soil more to its liking, nor nowhere else has intensive apple growing and handling reached a higher state of perfection. The production and marketing of this fruit has come to be a business of large proportions. Today the Pajaro Valley produces and ships out more apples than any other single district in the world. The shipments of apples and their by-products for the season of 1909 aggregated more than 4000 carloads or 2,550,000 boxes, and the acreage and production are yearly increasing. These apples were produced from less than 12,000 acres of orchards, and brought into the locality approximately $2,000,000 of outside money. In the face of these facts, it seems an idle waste of time to worry over adverse criticism from outside sources, even though it emanate from so high an authority as the snake editor of The Portland Oregonian.

Broaden Out

Referring further to the suggestion that an appeal should be made to the Department at Washington for assistance in solving the complicated problems confronting the soil culturist, we feel that the resolution committee failed to accomplish as much as it might. It was proposed in the convention that not only should the State University be most heartily commended for work already done, but it should be urged to greater effort along the same lines, and that, in addition, the Department of Agriculture at Washington should be invited to join more fully in the investigations. This latter was dropped by the resolution committee because it was suggested that it might not be "courtesy to the State University and its excellent corps of professors to bring into this convention any request for national aid." It may be that our State University can answer this question fully and completely and that the action of the committee in refusing to request federal aid is entirely justified, but we do not believe the staff of the State University would have considered such a suggestion in any way indelicate. We fail to see where in any sense there would be reflection on the University or any members of its staff by urging the bringing to California of every possible means of solving soil problems. Their magnitude precludes any possible completion of the investigation for many years, and the more light thrown upon them by the skilled people of the country, the quicker will prosperity come to the farmer and the more liberal will be the appropriations to the State University.

The campaign against ground squirrels is receiving impetus through the attitude of the State Board of Health in pressing for their destruction, but in any case their extermination should be energetically and persistently taken up. They are one of the worst of pests from the agricultural standpoint, but from the point of the saving of human life there is no computation of the damage which may come from permitting the ground squirrels to live.

Difficult Problems

Dr. King, in one of his lectures during last week's soil convention in Los Angeles, forcefully remarked that Californians are confronted by vastly more difficult problems in the maintenance of soil fertility than are Eastern farmers. Especially is this true of the orchardist who has to maintain fertility of the soil, yet during most of the year practices clean cultivation. This calls for careful study, and we claim to have farmers of a higher grade of intelligence than are engaged in agriculture in the East. We do not think any convention touching upon agricultural topics ever called together a brighter class of people than were convened last week in Los Angeles or will convene this week at Davis on the University Farm. But regardless of the class of people engaged in cultural practice, the requirements of knowledge in soil chemistry, soil physics, and soil bacteriology, have become so great that only the trained specialist can solve the problems.

Hence the work which the Univercity is accomplishing in its agricultural experiment stations should be encouraged. Further, we believe an appeal should be made to the Department at Washington. The time was when there was some petty jealousy as to who should take up the different lines of work in aid of agriculture, but with the magnitude of the problems pressing more and more we believe that spirit is disappearing; it is recognized by all that too much help cannot be secured.

Complaint has been made that some sections of the state have received from the Department at Washington more than their just share of expert service in solving such problems as that of shipping fruit. But true it is that those who ask shall receive. Neither is this altogether due to persistence in asking. The asking itself is proof to those in charge of such investigations that the people asking aid are ripe to put into practice the lessons taught by the investigations. This was never more emphatically shown than in the orange and grape shipping investigations. Both citrus and grape growers were keen to take advantage of the information secured, and millions of dollars have been added to the wealth of the country because of acting upon the expert advice given.

Troops for Forest Protection

The fearful loss from forest fires which the West has suffered this past season is calling attention to the possibilities of preventing its recurrence.. The loss this season has been sufficient to have provided a system of protection costing into the millions. However, it has been suggested that this could be done at practically no additional expense by transferring the regular troops of the army to forested sections during the danger months of the year.

California organizations which have to do with conservation of our natural resources have joined in the movement to secure this aid, requesting that the troops be placed under the direction of the Department of the Interior, or any other department for that matter, and assigned to duty from May to September. Such a step, we believe, would be most beneficial not only to those directly interested in the timber industry, but to water users, and, in fact, to everyone.

The troops were of great service during the terrible fires which swept the Northwest, but unfortunately were transferred to the field altogether too late. The time to stop the ravages of fire, as has been learned in every city of the United States, is at its inception. After it has once passed beyond control an entire army is insufficient to cope with it.

The Tulare Farmers' Union has inaugurated a scheme for providing the community with a packing house on the co-operative plan. It is believed that this is an opportune time for the movement, and there can be no question that a packing house would be a good thing for Tulare.

Believe in Yourself

Mr. Gerald Geraldson of Newcastle, Placer county, came 600 miles to attend the soil convention held in Los Angeles this week. Geraldson has a hobby. Unfortunately, he finds but few who agree with him, but one thing made emphatic during the convention, as also in the columns of former Cultivators, is the fact that Geraldson believes in himself and his theory. Sure it is he makes a good showing with his photographs and commendations from those who have seen his orchard in its former condition and under his present method of soil conservation. In a word, his theory is that nature is sufficient to restore its own equilibrium, and that if handled intelligently the soil will maintain its virgin fertility without adding fertilizer from without. He is not a believer in green manuring but does believe in allowing the natural growth to occupy the soil and to fully ripen and seed the ground for after years. This growth is not only allowed to stand during the wet season, but in each alternate row is allowed to stand during the entire summer. The next wet season finds it still occupying the ground, though somewhat mashed down, and through this mulch grows another crop of weeds. These, however, are plowed under the coming spring with the old dried growth, and the other rows which were given clean culture the last summer are left in their turn to be covered with the natural growth. This plan Mr. Geraldson has followed for nine years on 75 acres of figs, pears, and other fruits. The first four or five years he says he was somewhat uncertain as to results, but now he has increased the tree growth from four or five inches annually to four or five feet.

One great objection to Mr. Geraldson's method is that it takes lots of nerve for the orchardist on high-priced ground with high-priced trees to take it up, and we think in Southern California but few will try it. We understand many in Placer county, influenced by Mr. Geraldson's enthusiasm, are following his example.

Conserve the Water

The suggestion was made by Dr. King in the Soil Convention in Los Angeles last week that the storm waters of California streams be diverted from their courses at flood time to as great an extent as possible and poured upon the open, porous soils and gravel beds. As he said, if this great waste, which far exceeds the water used in the state, could be put into the lower strata of gravel to be later drawn or pumped out, it would mean a vast increase of the producing power of the state. This plan has been followed in some sections of Riverside, San Bernardino and Los Angeles counties. A great increase in the Santa Ana river especially has been secured by this diversion of winter water into the gravel beds. The domestic water system of the city of Pomona also has been largely increased by diverting the waters of San Antonio creek to the great stretches of gravel beds below the mouth of San Antonio canyon. These successes should be sufficient to encourage adoption of similar methods with other streams.

Boys for Foresters

Some of the towns of this state have organized boys into tree planting clubs. This movement is succeeding wonderfully in creating interest in trees, their planting, and the benefits accruing. Later a movement was started to interest boys in the native and other forest trees, in protection of the forests from fire, in spreading better ideas as to the necessity for the conservation of the trees and brush over our watersheds. Every step which may should be taken to encourage the youngsters in this movement.

This movement is encouraged by Gifford Pinchot and practically everyone interested in conservation. The eligible age is from twelve to twenty years, and farmer boys especially are urged to join in the formation of these clubs.

Agricultural News Notes of the Pacific Coast

Northern California

H. Hawes, of Molino, harvested 30 tons of Gravenstein apples from 155 15-year old trees. The returns were $777. His orchard is one of the best in that section.

The crop of broom corn along Butte Slough and the Sacramento river this season is larger than usual and the price is also good, being in the neighborhood of $200 per ton.

Seventy students are enrolled at the State farm at Davis. They hail from all parts of California and even some from Mexico. It is expected that 100 students will be registered before the lists are closed.

The Gridley Gun Club and others are interesting members in an endeavor to have their preserves stocked with Hungarian pheasants; the Game Commission has been asked to furnish several hundred birds.

The apple crop in the Oak Glenn district will amount to about 1,000 tons. The crop is composed mostly of Winesaps and Rome Beautys and will be handled by Rivers Bros. and other Los Angeles firms.

B. Sartori, who leased 600 acres of the Jackson bottom land below Yuba City recently received two carloads of milch cows, besides cream separators and other machinery for the big dairy he is establishing.

Twenty-two horses were burned to death recently in a fire that destroyed the Gridley Livery Stables, together with all its contents. The fire loss amounts to about $15,000, on which a considerable insurance was carried.

The beet sugar factory at Alvarado is running full blast and will have one of the largest outputs in years. Woodland and Pleasanton are shipping immense quantities of beets, the consignment at the mill reaching twenty cars a day.

Restrictive regulations on the part of the government of France affecting the products of dried fruit producers of California have been modified, according to information furnished the State Department by Robert Bacon, American ambassador at Paris.

Z. Cornelius, of Placer county, claims that he has broken the record in the matter of growing long pumpkin vines. One pumpkin vine on his farm measures over eighty feet and he predicts that it will reach the one-hundred-foot mark before it finishes growing.

Most of the wineries in Sonoma county are running full blast, crushing grapes. At the I. DeTurk winery in Santa Rosa Zinfandels are being crushed. The Fulton winery has contracted for 4000 tons of grapes and the Forestville winery has contracted for 3800 tons.

Plans and work are now under way whereby the State Game Farm at Haywards is being enlarged so as to double the capacity next season. Concrete fountains are being placed all through the pens, making the conditions for the raising of the birds more sanitary.

The harvesting and drying of Thompson Seedless grapes in the Sutter section is still progressing and it will be at least two or three weeks before the same is completed. The yield will be about 1600 tons. It is reported that about 700 tons of raisins have already been sold at 4 cents to 5 cents per pound.

At Live Oak, under the direction of A. W. Cutts of the local Almond Growers' Association, the almonds of the members of the Association are being bleached in the warehouse, and instead of the nuts being sprayed with water before being put in the bleachers, hot steam is forced into the bleachers where the sulphur is burning and the almonds are given a uniform bleach, and are then ready for immediate sacking.

Central California

According to the terms of a will left fifteen years ago by George Hicks Fancher, a wealthy pioneer of Merced county, a granite shaft to stand 68 feet in height will be placed over his grave on the Bear Creek ranch ten miles from that town.

At a meeting of the directors of the Tulare County Citrus Fruit Exchange, the following officers were chosen for the coming year: J. A. Milligan, president; J. J. Cairns, vice-president; W. E. Sprott, secretary; First National Bank of Porterville, depositary.

The central California orange season is at least six weeks earlier than usual and already the fruit is ripening and showing good color. Navels will be colored up by October 15, but it is not known whether any of the packers will begin to ship at that time. The crop will be about 25 per cent. larger than last year.

O. L. Flynn, real estate man of Strathmore, reports the sale of au eighty acre tract of land just west of that town to Assemblyman Cogswell. Forty acres of the land were formerly the property of O. L. Thomas of Los Angeles. The new owner plans to plant out the tract during the coming planting season.

Twenty-five fine wild turkeys were received at Porterville, September 23, from the state game commission's farm at Hayward. Members of the Fish and Game Association have been very successful in the propagation of Chinese pheasants and Hungarian partridges and for that reason they were selected to look after the turkeys.

An interesting visitor at the late Soil Convention in Los Angeles was W. S. Guilford of Willows, Director of Agriculture for the Sacramento Valley Irrigation Co., also known as the "Kuhn Project" or "The Pittsburg Syndicate." Mr. Guilford is a graduate from the Wisconsin Agricultural College and was much pleased to meet in one of the lecturers, Dr. King, one of his old teachers.

"Here lies the body of M. Theodore Kearney, a visionary, who thought he could teach the average farmer, and particularly raisin growers, some of the rudiments of sound business management. For eight years he worked strenuously at his task, and at the end of that time he was no further than at the beginning. The effort killed him." The late Mr. Kearney wrote this epitaph for himself.

The Turlock Grape Juice Company will put up very close to sixty thousand gallons of grape juice this year, the greater portion of which has already been sold in the east. Turlock grape juice is in great demand, not only on this coast, but in the eastern states. It is of the very finest flavor and quality, as nothing but the very finest quality of grapes are used in the manufacture of same.

Four thousand acres of land near Clovis, formerly owned by J. D. Collins and Mrs. G. D. McLaughlin, have been sold to a party of Eastern capitalists for a consideration said to be $250,000. The new purchasers are already making extensive arrangements to put the land in attractive condition for settlement. A thorough ditch system will be installed and avenues laid out, bordered with trees.

The high price of wheat during the past two years has given an impetus to grain planting in the state. An instance of this is given in the case of Charles Moreing and Lloyd Wood who farmed 13,000 acres in San Joaquin county. They are now harvesting with five traction engine outfits and the barley is averaging from 30 to 35 sacks to the acre. They will reap in the neighborhood of 369,000 sacks, which, at current prices, should bring about $390,000.

Southern California

The price of tomatoes at Fullerton in carload lots has declined from $18 to $12 a ton. Ten cars were shipped East the week of October 3.

The Santa Barbara Press says that the Lompoc valley mustard-growers have organized an association for the purpose of fixing prices and handling the trade in this product.

The San Diego Floral Association will hold their flower show on October 17-18 and claim it will be the finest and fullest exhibit of plants and flowers ever held on the Pacific Coast.

The first shipment of Imperial Valley cotton to Japan is on its way. H. Nose, representative of the great Japanese cotton manufacturing concern, Gosho-Goshi-Kaisha, purchased fifty bales.

Earl Bros. of Chicago have been sued in the Municipal Court by the California Produce Co. for $5,000, for alleged failure to pay for several shipments of fruit. The California Produce Co. is a growers' co-operative organization at Pomona.

In the cotton crop report for September, California again leads the entire country with cotton—90 per cent of the normal, as compared with 65.9 per cent for the entire country and 78 per cent for Virginia, which ranks next highest, leaving California far ahead of its nearest competitor.

On September 30 an official of the U. S. Weather Bureau from Los Angeles auctioned off the property of the Government at Salt Creek Bridge on the Salton Sea. The Government has completed its gathering of data and has abandoned its evaporation station.

An addition of fully 2000 high-grade milk cows to the dairy herds of Imperial Valley during the past twelve months is the estimate of F. L. Davis, of the firm of Crawford & Davis. This firm has handled more dairy stock in Imperial Valley than any other concern, and has kept close tab on the development of the dairy business during the past season.

The packing house of the Pachappa Orange Growers' Association of Riverside was destroyed by fire October 1. The loss to the association is estimated at approximately $8000 representing packing machinery, about 1000 fruit boxes, and quantities of wrapping paper and like supplies. This amount, however, is practically covered by insurance.

The shipments in carload lots from the Fullerton district during the week of September 24 were as follows: Fullerton-Placentia Association, three cars oranges; Chapman Packing house, two cars oranges; California Vegetable Union, seven cars tomatoes; Pacific Vegetable Company, three cars tomatoes; M. N. Cobb, two cars tomatoes; Stern & Goodman, one car beans.

Seedling date palms on the California Date Company's farm near Heber are in bearing this year at the age of five years, averaging from thirty to forty pounds to the tree. The dates generally are of good quality and marketable, although they are nameless. The seeds from which the trees were grown were Deglet Noor, but the fruit does not resemble the Deglet Noor any more than a seedling orange resembles a Valencia.

The deal for the sale of the Cabazon ranch property in the Coachella, of R. F. Garner has been closed, says the San Bernardino Sun. The purchasers are the Malone Land and Water Company and the purchase price is understood to be about $50,000. The men who compose the purchasing company are: T. E. Nelson of St. Paul, S. A. Rothermal of Chicago, J. B. Frost of Denver, C. P. Dorland of Monrovia and W. L. Malone and E. M. Larson of Los Angeles.

The Coast

L. G. Seaton has been secured by the Walla Walla (Wash.) commercial club to secure apples and pack them for exhibition at the Spokane apple show and also for the show at Chicago.

William Lee, Jr., who has a vineyard within the limits of North Yakima, was the winner of first prize on a general grape display at the Washington state fair, taking the blue ribbon on 35 varieties.

Homer and Schuyler Armstrong of Cora, Montana, who have been in the sheep business for many years, are now turning their attention to scientific farming and will sow about 300 acres to winter wheat.

Growing thoroughbred apple trees, to be registered the same as live stock, is a new idea which is spreading in eastern Washington. H. M. Litchy of the Yakima-Sunnyside district is the father of the plan.

Mr. F. P. Cooke of Phoenix, has accepted the position of editor on The Southwestern Stockman. Mr. Cooke, originally from Michigan, lived for twenty years in California, but for the past two years has made his home in Arizona.

The Okanogan Valley (Wash.) Fruitgrowers' association has been organized with these officers: President, B. L. Smith; vice-president, S. S. Bunn; secretary-treasurer, J. C. Gay; directors, I. W. Smith and S. G. Duley, and the executive officials.

A report to the Forestry Department from rangers who have estimated the burned area along Independence creek on the north fork of the Coeur d'Alene in Idaho states that the amount of timber left is of much greater area than first reports indicated.

William Scheble claims to have the champion Bartlett pear tree in Oregon. It is 42 years old and has borne thirty-seven consecutive crops. The tree is twenty-two inches in diameter, has a spread of fifty feet and is forty-five feet high. It is situated near the town of Ashland.

The Columbia Valley Fruit Company of Trinidad, Wash, has had surveyors at work on land on the west bar for a week locating flumes and a reservoir site. The company has cross-cut the mouth of Tkyson canyon for bedrock and if found practicable will put in a cement dam.

The Rogue River Fruit Association in Medford, Oregon, has opened a school for the purpose of teaching the experienced as well as beginniers to pack the new regulation box which is two inches shorter, one-half inch deeper and one-half inch wider than the old box.

As a result of irrigation investigations in the Willamette Valley, A. P. Stover reports that farmers must abandon old methods, have smaller farms, rotation of crops and intensive culture, if local markets are to be supplied at reasonable prices. Irrigation must also be practiced.

The highest price ever paid for state lands in Nez Perce conuty, Idaho, was secured at the sale of endowment lands held by State Land Commissioner Day and State Land Agent Wallace, Lewiston, and nearly every tract sold exceeded the estimate of the state appraisers. The price averaged $40 per acre.

It is costing farmers of Columbia county, Wash., approximately $25,000 a month to hold grain now stored in the warehouses at Turner. Alto, Menoken, Starbuck, Whetstone, Longs, Huntsville and Dayton, according to a local buyer. It is estimated the amount of grain stored totals 2,500,000 bushels. Of this amount 80 per cent, or 2,000,000 bushels, is still in the hands of the producers.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Practical Poultry Culture

A POPULAR BLACK BREED.

Of the black breeds and varieties of poultry, the Black Minorca easily occupies first place on the Pacific Coast. The reasons for this popularity are not far to seek. Belonging to the Mediterranean class, in habits and characteristics it has much in common with the White Leghorn, the line of cleavage being that it is a larger bird, and that it lays the largest egg of all our domesticated varieties. Like all its associates in the Mediterranean class, the Minorcas are egg-producers of the purest ray serene. If hen fruit were sold by weight instead of by the dozen, the breed would stand first for eggs, even as it is, many give it preference over the smaller Leghorns. Of late crosses between Minorcas and Leghorns have been resorted to for egg-production, it being claimed that the Minorca blood tends to an increase of size in egg, while the Leghorn increased the number produced. These advantages would not, however, go much beyond the first generation of the cross.

The illustration shown herewith pictures to the life the American type of the breed, when bred at its best. For symmetry of form, graceful carriage, and majestic appearance the bird is certainly an attractive object, —and what is more, the bird shown is a California product.

STANDARD BRED BLACK MINORCA COCK

EGG PRODUCTION.

W. R. Graham, the poultry expert, in his animal report of the Ontario (Canada) Agricultural experiment Farm, gives some interesting observations of the open air houses, covering a period of five years:

The difference in the percentage of egg production in favor of the cold or fresh-air house during five years for the months of December, January, February and March, beginning December, 1904, was found to be for 1905, 76 per cent; 1906, 8 per cent; 1907, 11.8 per cent; 1908, 15.6 per cent; and 1909, 12.4 per cent.

The egg production of early and late hatched pullets was compared. Between November 1 and July 1, April-hatched pullets averaged 77 eggs each and June-hatched pullets, 48 each. The cost of feeding 25 pullets and 2 males for 1 year, beginning November 1, was $29.64. The number of eggs laid was 3,053, valued at 62.34. Five hens, rated at 50 cents each, died during the period, making the profit $30.20. Each bird consumed 19.64 cents worth of animal food and 55.5 lbs. of grain valued at 94.12 cts.

With chicks hatched early in May and kept in a pasture, 345 consumed 4,304 lbs. of grain. The cockerels were removed when they weighed about 3½ lbs. each, and the breeding stock was taken from the pasture October 22. With other chicks reared in an orchard, 773 consumed 8,649 lbs. of grain. These were hatched and taken out at different times. These figures indicate that a 4-lb. cockerel can be raised on from 13 to 14 lbs. of grain worth about 21 cents. Other data showed that it cost from 5 to 7 cents to hatch the chicks.

AN IRISH EGG RECORD.

The Department of Agriculture and Technical Iinstitute of Ireland has completed an interesting egg-laying experiment covering 1908-09, the particulars of which have only recently been published. The general average for all flocks recorded was little more than 109 eggs per bird per year. One flock of Barred Plymouth Rocks laid an average of 187 eggs per bird per annum, but this was the only flock giving more than 180 eggs. White Leghorns gave a general average of 128.5 eggs per bird, with the average of the best flock of the breed 176.8, and the lowest flock 85. The Plymouth Rocks had the comparatively poor general average of 93.3. The only pen of Houdans for which complete returns were made showed the high average of 153.9 eggs per bird.

Cycle Hatcher Company
MANUFACTURERS OF
Incubators, Brooders and Fireless Brooders

Our machines are the result of 25 years experience in hatching and brooding and are the most practical made. Cycle Hatcher 50 egg size, $6 50. Brooder hatcher 50-egg size, $5.50. Main Office: Elmira, New York. Western Office: 9 Madison St., Oakland, Cal.

THE DANGER SIGNS.

In poultry culture, as with the human race, preventive measures against disease are better than cures. Chief among these are wholesome food and intelligent management, good sanitation in both houses and yards, pure water, and a plentiful supply of grit. If these elements are always in evidence the flock is quite apt to be healthy and profitable. A sick fowl patient is at best only a worry of the mind and an irritant of the pocketbook, and though in mild cases cures are often efficacious, it has always seemed to the writer that the only really good sick fowl he ever saw was a dead one. Often, if one is reasonably familiar with the habits and characteristics of fowls, ailing in its incipiency can be detected, and conditions so changed that no resort to pellets and pills will be necessary. Some of the danger signs of Biddy's going wrong may be enumerated not without interest to our poultry readers:

Most diseases of poultry take their inception from an ordinary cold, which if not checked, soon leads to more serious trouble. It usually makes its presence pronounced by sneezing, watering at the eyes, and a puffed appearance of the face. If it is accompanied by a rattling noise in the throat, it is an advanced cold accompanied with bronchitis; or it may develop canker in the mouth and throat, in which case it may be diagnosed as diphtheritic roup; if the fowl breathes with difficulty it has developed pneumonia; and finally, if the discharges of the nostrils are ill-smelling it has degenerated into common roup, which may also show hard lumps under the skin of the face. It will be noticed that all of these troubles take their inception in a mere cold, which may often be prevented by feeding onions liberally and red peppers chopped up fine in the mash. When specific remedies are to be applied give aconite in the drinking water, a dozen homeopathic pellets to a quart of water; another good remedy is equal parts cayenne pepper, ginger and mustard, mixed stiffly with lard, then flour, form into pellets about the size of a hazel nut; give by opening the mouth and dropping down the throat. Repeat if one treatment fails to effect a cure. When a cold has been allowed to degenerate into roup it is our conviction that the best thing is the hatchet. Seggregate the ailing birds from the healthy, and then kill and bury deep the afflicted. Many of the roup remedies that are on the market are not without their virtues, and to those who are so disposed, their use can be commended.

Looseness of the bowels, vent smeared and gummed, usually spells diarrhoea; if the discharges are bloody it is either dysentery or enteritis; greenish discharges are symptoms of cholera.

Diarrhoea is usually the result of bad conditions—such as filthy quarters, tainted food, impure water, etc. Altered conditions and wholesome feeding will often restore normal good health. It can be checked by feeding dry feed and giving boiled milk to drink. Dysentery or aggravated diarrhoea is invariably fatal, and taking one case with another, is hardly worth bothering with. Hence weed out the ailing birds and destroy them. The same remarks apply to cholera.

Ruffled plumage, droopiness, purple comb, with dark watery discharges at the eyes, shows evidence of liver congestion; when the discharges turn yellow it is inflammation of that organ. Liver troubles can usually be traced to overfeeding. Use a good liver pill and correct wrong conditions, and relief will follow; when once inflammation has set in cure is almost impossible.

The presence of chicken pox is usually indicated by ulcers about the head and face. Wash with carbolic soapsuds and anoint with fresh lard or vaseline.

General debility and mopishness indicates indigestion, due to over-feeding. Alter your system, see that the condition and environment is pure and healthy, and the head will soon be normal.

Lameness may be the result of an accident or rheumatism; usually produced by cold and damp quarters. Alter conditions.

As a preventive measure charcoal is a good thing to have about. It prevents disease by absorbing the gases in the system and also by its cleansing mechanical action. Birds having access to it will eat quite freely.

Common hard soap dissolved in water to the consistency of soft soap, one teaspoon to the gallon of water will clean the nostrils and throat and act as a mild purgative.

Epsom salts is a good and simple drug for maintaining health. Give about a teaspoonful to each twelve hens once a week. Dissolve the salts in just enough water to take them up. Then employ this liquid in mixing the mash, making it dry and working over and over. Give for half a feed. In this way the birds all get a share. Salts cool the blood, clean the intestines and stimulate the action of the liver and other excretory organs.

Peroxide of hydrogen is another cleansing agent and a destroyer of disease germs that can be used to advantage externally in case of wounds, sores, etc.

Disease, as has already been said, is invariably the result of wrong conditions. Normally, chickens are healthy. Intelligent care-taking, wholesome feeding, and good sanitation are worth more than all the preventives and cures that man has devised. Are you and your birds in close touch with all three?

NO PLACE FOR DRUDGERY.

The poultry yard work should not be a place of drudgery and will not be if arranged with an eye to comfort when being built. On the contrary, it will be a pleasure to do many things that need to be done daily—such as watering, feeding and cleaning the house.

The food troughs should be arranged so as to be easily cleaned, and the dropping boards made so that a minute's work with the shovel or hoe will take off every particle of filth.

The house need not be an expensive one in order to have it this way; but one built of cheap material will be just as good, provided the roof is water proof and the sides free of draughts.

The fowls should never be allowed to sleep in trees or in barn lofts. One reason why so many farmers dislike poultry is that it is allowed to make itself a nuisance around the barn. Hens do not go to the barn or treetops through choice. They are usually driven there by the neglect of the owner, in not providing a good, clean house for them. If you expect your hens to lay during winter you must look after their wants.

Mammoth Hatchery

We are the great poultry Emporium in the West. We sell only the very best, at prices that will bring your orders right along.

1500 to 2000 Splendid Pullets and Laying Hens

in our yards and orchards every day. Finest and largest poultry sales yards in Los Angeles. Lately sold over 20,000 birds. We have on hand daily from twenty to thirty different breeds. Ask about P. Cook's Extra Select White Leghorns, the finest, largest, most prolific layers in the world. Only $15.00 per dozen. This week also the best flock of White Minorcas in California for sale. Poultrymen, Attention

We want to tell you what we are doing. We are erecting at the present time Yards and Pens for the largest and most up-to-date plant for fancy poultry in Southern California. We can carry on hand with our new yard about 3000 birds. We sell every standard variety, of Pullet, Cockerel, Laying Hens and Cock. We have them on hand EVERY DAY OF EVERY WEEK OF EVERY YEAR. We have been in the Hatching business for 12 years in the west. The Pioneer Hatchery has been established for several years, and from a small start is now the largest baby CHICK DEALERS IN THE ENTIRE WORLD. No order of any kind in the Poultry Line is too large for us. If you want to sell 100 or 1000 hens or more we will be glad to bid on them for spot cash.

We are shipping at present about 7500 baby chicks per week, of the Reds, Minorcas, Leghorns (White and Brown), Barred Rocks, Buff Orps., etc. Whatever you need in our line we will be glad to make a price on. If we can't sell you better poultry for less money, don't buy from us. INVESTIGATION is all WE ASK.

Irrigation and Forestry

MARGINATA.

As I have noticed recently statements in The Cultivator asserting that this unrivalled species does not flourish very well in California, it has occurred to me that there must be a reason for this non-success. It may be that the planting has been done in unsuitable soils and localities.

Before dealing with this aspect of the question it may be as well to consider the tree in its native habitat in Western Australia. According to the great authority on eucalyptus, the late Baron von Mueller, it is found from "King George's Sound to Cape Leeuwin and the Moore River, forming the principal forests in Southwestern Australia and occupying a region not far removed from the coast. The Jarrah in its humid native region seems more indifferent to soil and situations than most other eucalyptus, but it avoids hot and dry tracts of country. I saw it descend (in a stunted form) on sandy ridges and calcareous declivities close to the sea shores, and traced it, as a shrub, to the rocky summits of the Sterling's Range (nearly 3000 feet high). But its development for extensive timber forests takes place on the ranges of older rocks well within the influence of the sea air, as shown on the forest map issued by the Hon. Malcolm Fraser, Minister of the Lands Department of Western Australia. Throughout nearly the whole region of its range the Jarrah is largely mixed with Calophylla (the Southwest Australian Red Gum or Bloodwood Tree). Marginata is not a tree of rapid growth and therefore not one of early regeneration either. The choicest timber is obtained from the slopes of the granite and ironstone ranges which are within the influence of the prevailing moist southwestern summer winds." Baron von Mueller also expressed an opinion that the development of the Jarrah would be more rapid in moderately elevated mountains than in flat country.

Mr. Blair, superintendent of the Yan Yangs forest plantations at Lara, Victoria, planted some Jarrah there seventeen years ago. He informs me that some of the trees are doing remarkably well. He thinks they should be put in about ten feet apart and thinned out subsequently to twenty feet, as they are a bold, strong growing species and appear to require plenty of room. The trees at Lara have attained a height of from 30 to 35 feet, with a stem girth at two feet from the ground of two feet nine inches. The soil they grow in is poor, and the rainfall rather light, but the plantations are near the sea, only a few miles inland.

It may be presumption on my part to assume that the Jarrah has not been planted under favorable natural conditions in California. Perhaps it has, and has failed to succeed as a forest tree, but I still think until I am assured to the contrary, that plantations in rangy country with a good natural rainfall, not too far inland, on deep granitic or ironstone soils, ought to give satisfaction. All our best timbers here, like the Ironbark (E. Sideroxylon), Grey Box (E. Hemiphloia), and the Jarrah (E. Marginata) are slow-growing trees, producing for that reason unrivaled hardwoods, and it cannot be expected that the Jarrah, even in a country like California, will grow with the celerity of the Bluegum or Sugargum.

* * *

In a later letter, answering questions which we sent him, Mr. Blackburne writes:

You ask me amongst other things if Australia is doing any commercial planting of trees in a large way. We in Victoria are not doing much yet beyond a few hundred acres of pines, acacias, and eucalyptus, and the other States have not, with the exception of South Australia and New Zealand, made much headway with planting. Our native forests are not exhausted yet and when the original is cut down seedlings come up like a crop of wheat and only require thinning and regulating to form a good forest again.

In establishing young eucalyyptus forests I have had considerable experience and always prefer to sow the seed broadcast instead of planting the young trees. When the seedlings come up (we sow in July) and attain a height of a few inches, say about March the following year, they are thinned out to a distance of seven or eight feet apart and allowed to stand for a few years until thinned again for commercial purposes. We do not water or irrigate under this system, but depend upon the natural rainfall (22 inches). We principally sow Bluegum and Sugargum. Eucalyptus raised in our nurseries for free distribution are sown in seed beds in the open and potted off into three-inch pots.

AGRICULTURE

AMERICAN COUNTRY WAYS.

By Edward W. Perry.

MANY American country ways can scarcely be called ways of pleasantness. On the contrary, hey are usually crude and dirty, ugh and noisy. They waste time, ence and energy, and they spoil comfort of all who must endure ese defects. In dry seasons they are dusty, in wet weather they are little better than canals of mud; and at all times they are needlessly steep and costly.

This is true largely because American highways, like Topsy, "jest growed." Practically all our roads began as mere trails through vilds, were widened a little by the oneer who lopped off a branch ere, a root there and cut down a ree yonder, that his pack-animal might squeeze past. Later comers dug up a stump or a stone, now and then, and trimmed down the sharp banks of the stream, because they were using cart or wagon to carry wife and babe and household belongings to their new home in the wilderness.

All these early travelers followed the line of least resistance, so far as they found it without too much searching. Believing that they would not soon go that way again, and used to making light of such difficulties, our sturdy fathers did little more than was necessary to the moment. So many followed that in a few years they found it good to come together, now and then, to make roads, as neighbors in those friendly days used to have logging-bees, house raisings, apple-paring parties, and quilting-bees, and such other meetings for mutual help as might fairly be made an excuse for dance and frolic. To this hour, in many a corner of the land, road making is regarded as a yearly "bee" at which neighbor and friend should swap tobacco and yarns and jests between short spells of work.

But millions who dwell in country places now see that their wagon roads should be made far better than they have ever been, even when at their best. It has at last been seen that the condition of these roads affects the pocketbook of every human being in all the land, more directly and materially than it is affected to any other one cause. This will be so while every human being in the land must use products of the American farm, because all these products must be hauled over these thoroughfares from farm to market. The cost of such moving is increased by everything that hinders the easy moving of the wheels by which the products are carried.

More than half of the scores of millions of tons of things taken each year from American farms; practically all of the tens of millions of tons of food required by seventy millions of people of this country; all the millions of tons of cotton and of wool they wear, and many another thousand tons of other things th want for their health, their comfort or their luxury, must be hauled by animals through dust or sand or mud, up steep grades or over pebbles that make up the first stage of their journey from field to consumer. From this wastefulness no present relief is offered, because almost ninety-three of every hundred miles of American wagon roads are rough and steep, badly drained and costly.—From the National Grange.

ESSENTIALS OF DRY FARMING.

W. W. Burr, in charge of investigations of soils at the experiment sub-station at North Platte, Neb., has sent an interesting report covering three year's investigations in the storing of moisture in soils.

First:—That land which is under thorough cultivation absorbs water much more freely than land not under cultivation, or which is covered with grass or for any reason has a hard surface.

Second:—That land under thorough cultivation loses but little water from below the first foot of surface evaporation, so long as the mulch is kept in good condition.

Third:—That a growing crop uses water from the land in proportion to the growth of dry matter in the crop.

Fourth:—That land under summer tillage or thorough cultivation from May 1 to September 1 on the Nebraska sub-station farm has accumulated from 5.5 to 7 inches more water in the first six feet of soil than similar land growing a crop. The water so stored has been equal to from 4 to 50 per cent of the rainfall for the same period. The moisture content on summer-tilled land increases below the six-foot level and is apparent to a depth of at least 10 feet.

Fifth:—That water stored in the sub-soil to a depth of at least six feet is available for the use of farm crops, and that alfalfa is able to draw water from much deeper areas

Sixth:—That abundance of water in the sub-soil is a great protection to the crops against drouth, and that moisture in the surface soil, while it may favor the immediate growth of the plant, does not protect it against prolonged drouth. The protection of the crop against drouth is in almost exact proportion to the total available soil water within the reach of the crop.

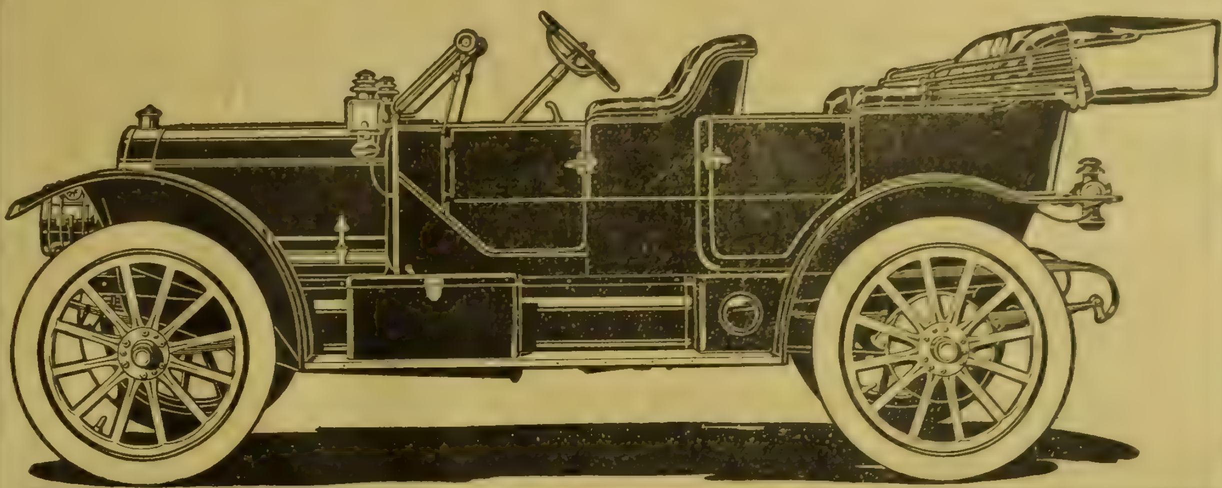
Seventh:—That grass crops (alfalfa and brome grass) dry the sub-soil to such an extent that the first crop following grass is wholly dependent on the season's rainfall for its moisture supply.

Eighth:—That a rainfall of from a quarter to a half inch may have a decidedly beneficial effect upon a growing crop, and is of great assistance in securing a good stand at seeding time. Such a rainfall has little or no effect in increasing the water in the lower soil unless the surface is already moist from previous rains. Less than a half-inch of rain falling on a dry soil mulch does not wet the soil below the mulch and is soon evaporated by the sun and wind.

Organization insures development. It is a step forward for the farmer.

Organization brings industries together to devise ways and means to better their conditions. Why will not the same association benefit the farmer?

By organization man has been able to ascend the scale of civilization, so by organization will be able to ascend to a still higher plane of progress and prosperity. Farmers are men, agriculture by God's will is the greatest calling of man, protect it then by organization.



Rambler
Limited Output
1911

Rambler
Sixty-three

THE Rambler line for 1911 is complete, including landaulets, coupes, limousines, town cars, roadsters, toy tonneaus, and five and seven-passenger touring cars with detachable fore doors. Details and construction alike for all; two sizes—forty-five and thirty-four horsepower. Forty-inch wheels on all seven-passenger open cars; thirty-six-inch on all others.

Every detail is refined, producing gratifying comfort and silence. Standard equipment with every model: Spare Wheel and tire, shock absorbers, top and envelope, wind shield, five lamps, gas tank and tools. Ninety-two per cent of all Rambler parts are made in the Rambler factory. Years of experience in cultivating painstaking habits of workmanship have created a standard of quality such that to actually make so many of the parts even in a factory as large and completely equipped as the Rambler, the output must be limited. The Rambler has acquired distinction as the standard car for the farmer because so many farmers possessing the keenest buying judgment have chosen the Rambler. In many cases the Rambler has been the choice of those who have had experience with cars of low value and have learned to demand better quality. They take pride in owning a car of quality. Many purchase the Rambler because of its exclusive advantages: the Spare wheel, which puts an end to tire trouble; big wheels and tires, which assure comfort and less tire expense; the straight-line drive, which saves power; and the offset crank shaft which enables you to climb a hill as fast as you want to go and to travel on high gear, in crowded traffic, no faster than a man usually walks.

You can have a copy of the Special Announcement Number of the Rambler Magazine if you will send us a postal at once, giving your name and address and stating the style of car you prefer.

Covina Nurseries

312 Byrne Bldg., Cor. 3rd and Broadway, Los Angeles

For the first time in California, guaranteed seedlings are now offered of the

Best and Fastest Grower of all Eucalyptus, the

San Jose Gum

Has all good qualities of Blue Gum, but without its defects. Does not check, warp or come soft at the heart, is hardy, tougher, heavier and lasts longer than Globulus, and grows faster than any tree in the world. From choice parents 5 feet in diameter.

Plants packed lightly for long distance shipping by moss process, or balled in earth and packed in sawdust--equal to paper-pot method

These seedlings are grown by the the discoverer of the San Jose Gum, who has used this variety in millwork for ten years and finds it a perfect hardwood, superior to all. It is justly called **the King of Eucalypts,** and is destined to supplant most of the others.

The LaVerne Rotary Cultivator

The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Chestnuts.

Can chestnuts be grown successfully in California? At what age do they commence to bear? Will they do best near the coast or in the interior?—G. B M., Nordhoff.

The Italian chestnut has been grown with more or less success in California, especially in the eastern foothill sections of the San Joaquin and lower Sacramento Valleys. They succeed best in a heavy clayey soil, coming into bearing at six or eight years of age. The Japanese variety is said to bear somewhat younger. The trees may be grown in nursery till several years old providing the tap root is cut at end of first year.

Bougainvillea.

I have bougainvillea four years old. It is a very strong plant but has had only one blossom this season and that dropped during the hot spell. It seems the heat cooked it I have seen other plants less than a foot high with a profusion of blossoms. This vine reaches to the second floor and has exceptionally luxuriant growth. The ground is exceptionally rich. What can be done to make it bloom?——L. B., Gardena.

We presume the trouble in this case is that the plant has been given too generous treatment. The rich ground has sent a wealth of growth up the side of the house and instead of having time to care for blossoms its whole energy has been given to growing branches and leaves. Also, it may be that the branches have been exposed to too direct sun heat, but we do not think at Gardena that would a factor. If, however, the roots might be left with full benefit of the sun and the branches drawn on the shadier side of the house, it might be a help. A slight withholding of water may also be beneficial, but when the vine once attains its growth, we think our subscriber will find an abundance of blossoms.

Length of Cord.

How long should a cord of stove wood be?—E. M., Loomis.

The dimensions of a cord of wood are 4 x 4 x 8 feet. Different sections of the country follow different practices in piling. The writer remembers in his section of the East a "cord" was usually held to be a single tier of 18-inch wood, 8 feet long and 4 feet high. In California a cord is considered three tiers of 12-inch wood 4 x 8 feet. To answer query as it is given, we will say that the length of the pile is 8 feet.

Pruning Malagas.

What time is the best to prune Malaga vines for best results? How early could I prune them without injury to the vines or coming crop, as I have so much Bermuda and Johnson grass that I would like to get to work the ground? Could I cut off the brush and prune later. I would like to get rid of the grass. It is a low, moist ground.—Subscriber, Selma.

Malaga grapes are usually pruned along in February. In cases like yours we have never hesitated to chop off the runners that interfered with cultivation in September. These are roughly cut off and the center canes that are not in the way can be left until the regular pruning time. The only idea in leaving them is that the vine may not be checked suddenly but have time to thoroughly ripen its wood. I sometimes think this is more theory than actual knowledge for where vines are pruned early it does not seem to greatly affect them in growth. On land like yours the weed knives should be run all summer and the hoe used close in at the trunks. One summer of constant work will nearly finish these pests. The difficulty is they are allowed a fresh start each season. The constant running of the weed knives will prune off runners that would be in the way early and the vines then grow more upright and out of the way without hurting them.—M. E. S.

Mange-Canker.

Some of my pigs have been having what at first I thought was just a cold —their eyes began to matterate and almost closed and little lumps about the size of a pea raised up on their ears and noses almost like blisters. A young boar is the worst as his eyes are quite shut and there is a breaking out around his eyes and a ring of the same around his tail about an inch from the root where the skin looks almost raw. Am feeding stock beets, fresh alfalfa, a little skim milk and a little boiled squash or potatoes. All eat well.—H. G. F.

From the description this may be mange or it may be canker sores. If it is mange the pigs should be washed all over with soft soap and then dry fine sulphur well rubbed into their skins. If the hogs are large a tank for dipping has to be used and tobacco solution is found excellent. The pens should be sprayed with a disinfectant solution and if possible remove the pigs to fresh ground and plow up the old yard, planting to barley for one season. If the trouble is canker dissolve one ounce of permanganate of potash crystals in a gallon of water and dip the pigs in it; be sure every infected spot is reached. After the pigs are dried rub carbolated vaseline on the sore places. The pens and surroundings must be disinfected carefully to prevent reinfection.—M. E. S.

Dairy Questions.

At what temperature should the cream be, to be ready for churning? Also, is there any coloring or preservative article that you can recommend since most ranch butter seems so white? Would like also to ask how much salt should be used to a pound of butter, also your recipe for cottage cheese.—Subscriber, San Dimas.

We usually churn at 50 degrees in California when making butter in a small way; 40 to 54 are about the limits of temperature. Common salt is the best preservative for butter. It may be used as high as one and a half ounces to the pound. The old-fashioned people that packed butter for market used to make a mixture of four pounds of salt, one pound of sugar and six ounces of saltpetre. The saltpetre I am not sure is now allowable under the Pure Food Law. It is not believed by chemists to have had much effect in keeping the butter. The coloring that we like best is Hansens, but any of those offered for sale are admissible. Salt one ounce to the pound is the usual rule.

The making of cottage cheese is a simple matter. If made from skim milk, heat to blood heat and let it stand until it clabbers. Then put on the fire and bring to a scald until it begins to separate. Have it ready to stir until curds are formed, then put into bags and drain. After it is rather dry, take in the butter bowl and rub smooth. A fork will do this. Salt, stir in cream and mold into half-pound balls. The other way is to use the buttermilk..—M. E. S.

Chestnuts on Oaks.

I wish to speak of my experience with grafting a chestnut on a live oak. The chestnut and oak are members of families nearly related. I took an oak tree two inches in diameter, cut it off and inserted scions from a desirable chestnut. I have now three branches about 16 inches long that are growing well and apparently making a fine union with the parent stock.—Edward Mazel, Loomis, Placer county.

Business Notes

NITRATE OF LIME.

The recent meeting of the Soil Convention in Los Angeles for the discussion of various matters pertaining to the soils and their treatment, such as fertilization, has brought out considerable new information. The principal speakers of the Convention were very profuse in their criticisms of some of the methods and materials employed in fertilization, and also quite complimentary regarding some of the operations with reference to the chemicals and materials used in fertilization. One point brought out in these discussions was that Nitrate of Soda persistently applied to the soil produced a black alkali which was detrimental. The new Nitrate producing chemical, Nitrate of Lime, manufactured in Norway, was spoken of very highly as a nitrogen conveying agent. One of the essential features with reference to this Nitrate of Lime is the fact that the black alkali is not produced, but a beneficial constituent, Calcium, is brought forth in its stead. The Braun Chemical Company, of Los Angeles, are the disributers in Southern California for this Nitrate of Lime, and any information required regarding the same will be cheerfully given by them upon application.

TRACTION IN AGRICULTURE.

Another step towards power cultivation has been made by an inventor of Birmingham, Alabama, who is now manufacturing a traction cultivator weighing under 3500 pounds which uses for generating power either kerosene or gasoline. The cost of operation is said to be exceptionally light and its work on practically all kinds of soil most satisfactory. The time is coming for this style of economy on the farm.

Theodore Payne has just published a new booklet on California Wild Flowers. It is artistically printed with some fine half-tone cuts and describes nearly one hundred species with valuable notes on their culture. Many California wild flowers, especially the annuals, are of easy culture, requiring scarcely any care and will produce a grand display of flowers for many months. Mr. Payne has made a study of the native flora for many years and has often advocated the culture of wild flowers in our gardens. He is the first one to collect and place before the public seeds of these beautiful flowers; his former publication met with such appreciation from the public that we feel sure our readers will be pleased to hear that he has now issued a new booklet.

POULTRY SHOW DATES.

Stockton, Cal., Nov. 8-12, 1910. First Annual Exhibition of the San Joaquin County Poultry Association. Eugene P. Sabin, Secretary, Stockton.

Oakland, California, Nov. 22-27, 1910. Annual Exhibition of the Alameda County Poultry Association. E. K. Healey, Secretary, Alameda, Cal.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

MISCELLANEOUS.

Learn Wireless and R. R. Telegraphy! Shortage of fully 10,000 operators on account of 8-hour law and extensive "wireless" developments. We operate under direct supervision of Telegraph Officials and positively place all students, when qualified. Write for catalogue. Nat'l Telegraph Inst., Cincinnati, Philadelphia, Memphis, Davenport, Ia., Columbia, S. C., Portland, Ore.

FARM LANDS FOR SALE.

Owens Valley Lands—The greatest opportunity for the California farmer today is awaiting him in the Owens River Valley. This remarkably fertile spot possesses more attractive features than any land in California. The only land in California that will produce with equal results the big red winter apples that have made Washington, Oregon and Colorado famous, and have brought to the owners untold wealth. California farmers should learn real conditions of apple culture and appreciate that these lands under development, are equal in value to our choicest orange lands. The conditions which surround Owens River Valley are ideal in every particular. Not only is the climate nearly perfect and the scenery all that one could desire, but the productiveness of the soil excels anything in California. Corn 13 feet high, with ears 18 inches long, running 70 bushels to the acre. Potatoes that run 500 bushels to the acre, equaling the famous Greeley, Colorado district, where such land is worth $500.00 an acre. So remarkable is the productiveness of the soil in the Owens River Valley that one should consider its value purely upon its ability to earn, rather than to compare it indifferently with acreage in any other section. There is just as much difference between the Owens River Valley land and the land that is ordinarily offered as there is between the value of Hill St. and Broadway property. The Owens Valley land is 4,000 feet above the sea, with just sufficient frost in winter to make a perfect red apple. Fogs, hail or gales are unknown. The supply of pure mountain water is unlimited and the completion of the new Southern Pacific railroad, which will be running in 30 days, makes the entire proposition ideal. You owe it to yourself to thoroughly investigate this property, for there will be, without a doubt, a greater increase in value in the Owens River Valley in the next few years than in any other point in California. In fact, we look for nothing short of a boom the coming year. If you own orange or walnut land that you can sell at a good price, you will certainly be making a good move to dispose of it and go into this new country. We can doubtless help you in selling your land. We have done it for others. Drop into this office and talk with our representative, who is an old Rogue River apple man of 20 years' experience, and who has studied Owens Valley conditions and can give you a very intelligent description of our property, or drop us a postal and permit us to send you our literature. James R. H. Wagner, H. S. Cook, Room 13, 329 South Hill St., Los Angeles, Cal.

Stock Range With Plenty of Water—A friend owns 5 springs on best free range in Arizona. You can buy them for $2,500 and each member of your family 21 years old can take 320 acres government land alongside. Eight miles from station. The range is covered now with green feed knee high. Best opportunity in America. Write and I will tell you where to find the springs and owner. Scott, 951 S. Figueroa, Los Angeles.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

20-Acre Ranch—In the orange belt north of Exeter. 10 planted to oranges, well that tested over 100 inches, with pumping plant installed. Electric lights, running water, and ideal location. ½ mile from railroad. For one desiring a home, they could not find things nicer or location better. Address Box 103, Visalia, Cal.

$6,500 Buys 120 Acres—Situated 3 miles south of Santa Maria, good improvements, plenty water, orchard, large barn and corral, chicken houses, windmill, tank, tank house, and modern six-room cottage with bath and pantry. Every modern convenience. Address R. Morrison, Owner, Santa Maria, Santa Barbara Co., Cal. Box 171.

Irrigated Land For Sale, Cheap—In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address Manager, American Rio Grande Land & Irrigation Co., Mercedes, Hidalgo County, Texas.

For Sale Cheap—$300 buys a 160-acre relinquishment claim, fine rich level land, plenty of water at 150 feet. Close to a fine market. This is the best bargain you ever heard of. No exchanges. Wm. T. Mantz, Pattiway, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Fruits, Flowers, Sunshine, Progress—All these invite investigating beautiful Hemet Valley, Southern California. Booklet free. William Kingham, Hemet, Riverside County, Cal.

For Sale—A bargain! One of the best 5-acre fruit and alfalfa ranches in Escondido Valley; good house, outbuildings, well, windmill, tank, fine shade; 1½ miles from Escondido; $2650. For particulars address C. O. Husted, San Marcos, Cal.

For Sale—El Cajon Grant Land. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. Hawley, 1548 D St., San Diego, Cal.

25-Acre Ranch—With buildings, water, some fruit, close in Santa Rosa. Sell all or part. Albert Bacon, R. D. 5, Santa Rosa, Cal.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

FARM LANDS FOR SALE.

Tulare County Dairy Ranches Pay—I have several very attractive propositions in lands adapted to dairying, alfalfa, hogs and cattle. Some of them with artesian wells and pumping plants. Immense body of surface and artesian water underlaying the surface from 12 to 20 feet. On main line railroad. Close to town and schools. Telephone and electric lines near. Some improved places. Values are increasing fast but I can show you property with some improvements at $40.00 and up. Also have cheaper land that contains some fine alfalfa land and balance grazing. C. H. Biggin, Pixley, Tulare Co., Cal., or 1813 S. Union Ave., Los Angeles.

For Sale—480 acres, 20 miles of Delano. All fenced and cross fenced in 4 fields. Some improvements. Large body of water by damming creek. 4 wells and one spring. Water rises within 5 ft. of surface. Price $15.00 per acre. $3000 down, balance mortgage. Parrish Barker, 207 Union Trust Bldg., Los Angeles.

Farms Wanted—Don't pay commissions. We find you direct buyer. Write, describing property, naming lowest price. We help buyers locate desirable properties free. American Investment Association, 12 Palace, Minneapolis, Minn.

For Sale—Quite a variety of alfalfa and fruit ranches in several counties. Also some land in good, new settlement. Send for descriptive list. Address, W. S. Ritchie, Corona, Cal.

For Sale—5 acres good land for apples, berries or chickens, close to electric cars, school, store; price $1500, easy terms. Address Frank Lima, Box 94, Sebastopol, Cal.

POULTRY.

For Sale—A few choice White Rock cockerels hatched from eggs bought of U. R. Fishel, Hope, Indiana. The eggs cost me $8.00 per setting and $2.00 expressage. "Fishel's White Rocks are the best in the world." You should get one or two of these cockerels and introduce some new blood direct from Fishel in your flock. It will prove a great investment for you. Some of them are good enough to exhibit in any show. Price $3.00, $5.00 and $7.50 each. Mrs. E. E. Young, 444 East 48th St., Los Angeles.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

Hayes, R. B., Poultry Fancier and Rhode Island Red Specialist—30 breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 35, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

Until November 15th, special mating Kellerstrass Crystal White Orpingtons, $3.00 for 15 eggs. Buff Wyandottes, the classy American bird, $1.50 for 15. Best winter layers. No more at this price; try them. Eggs and stock guaranteed.. Frank Haasis, Ontario. Cal.

For Sale—Eggs for hatching. Black Minorcas, Barred Plymouth Rocks, Rhode Island Reds, and Buff Orpingtons, $1.00 per 15, $5.00 per 100. Day-old chicks, 12½c each. Also cockerels. Cash with order, or stamped envelope for reply. L. W. Neilsen, R. R. 2, Box A1, Petaluma, Cal.

For Sale—Eggs for hatching, Black Minorcas, Barred Plymouth Rocks, and Rhode Island Reds, $1.00 per 15, $5.00 per 100; chicks, 12½c each. Also pullets and cockerels. L. W. Neilsen, R. R. 2, Box A 1, Petaluma, Cal.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers

Pedigreed, trapnested, scientifically bred. Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME.

A few cockerels for sale. C. C. Bonnell, State Vice-President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

Sixth and Main Streets Los Angeles

"There's very little heat. But try this with an ordinary lamp and see what happens."

LIGHT—NOT HEAT

The Angle Lamp gives less heat than any other method except incandescent electricity. Will *not* scorch or discolor your ceiling, etc. Eliminates possibility of fire. Gives well distributed shadowless light without dangerous and unpleasant heat—delightful to read or work by.

The Angle Lamp

is the simple, economical, convenient and perfectly satisfactory method of burning common kerosene. It *never* smokes or smells whether burned at full height or turned low. *Lighted and extinguished like gas.* Filled like a water bottle. Requires filling about once a week.

The Cheapest Form of Light

Being fully 1/3 to 1/2 more economical than even the ordinary lamp it soon saves its cost. It is made in 32 varieties. Come in and see it or *write for catalog.*

FOR THE MASTER'S USE.

The writing desk lay open. Its owner had been called away in the act of beginning an important letter. On it were laid a sheet of note paper and an envelope; beside it stood the ink bottle, and close by lay a pen, the blotting paper, and the pen wiper.

The silence of the room was broken by the note paper speaking to his companions.

"You needn't look so consequential," he said, scornfully; it is on me the letter will be written."

"Yes," said the pen, "but you forget it is I who write it."

"And you forget," said the ink, "that you couldn't write without me."

"You needn't boast," said the ink bottle, "for where would you be but for me?"

"It is ridiculous of you all to be so conceited," interposed the blotting paper; "only for me what a mess you'd be in."

"And may I ask," said the envelope, "what use would any of you be if I did not take the letter safely where it is to go?"

"But it is I who write the direction on you," snapped the pen.

"Dear sirs, please stop quarreling," gently said the little pen wiper, who had not spoken yet.

"What have you to say?" asked the pen, contemptuously. "You are nothing but a door mat," and he laughed at his own wit.

"Even if I am only a door mat," said the pen wiper, humbly, "only for me you would be so rough with dried ink you couldn't be used. And that is all any of us are good for—just to be used. We might all stay here for the rest of our lives, and not all of us put together could write that letter. Only the hand of our master can do that."

"I believe he's right," said the envelope and note paper together.

"Yes," said the ink, "it was foolish of us to forget that we can do nothing unless we are used."

"True enough," murmured the ink bottle, "for what use would I be if you were not in me?"

"Yes, to be sure," said the blotting paper, "we ought to have thought of that."

"Indeed, yes; and I'm sure I beg your pardon, Mr. Pen Wiper, for calling you a door mat," said the pen in a humble voice.

"Please don't mention it," said the little pen wiper, "but I do think we would be happier if we would just do the best we can, without being jealous."

As he spoke, their owner re-entered the room and silence fell. The pen was taken up, dipped in the ink and passed to and fro on the note paper; the blotting paper pressed on it; the letter placed in the envelope; the address written; the pen wiped on the pen wiper.

"We have each done our part," murmured the ink.

"Yes," said the pen, "and without our master we would have done nothing at all."—The British Messenger.

HER STATUS.

Ella: Nothing very serious about her.

Stella: I should say not. If that woman knew the world was coming to an end next week, it would be just like her to write to a newspaper, asking what to do for blackheads.—Harper's Bazar.

UNSELFISH.

Mrs. Backbay: Why are you leaving us, Bridget?

Boston Cook: Me reasons are philanthropic. I want to give some wan else a chanct at the joys of living with yez.—Harper's Bazar.

ANTICIPATED.

Margaret: Did you tell the girls at the tea that secret I confided to you and Josephine?

Katherine No, truly I didn't. Josephine got there first.—Harper's Bazar.

THE LITTLE THINGS.

My dear, the little things I did for you
 To-day have brought me comfort, one by one,
 As through the purple dark a shaft of sun
Strikes far at dawn, and changes dusk to blue;
The little things it cost me naught to do
 Remembering how slow life's sands may run,
 Today a web of purest gold have spun
Across the gulf that lies between us two.

Oh, dead and dear, the many little things!
 The loving words I did not fail to say,
The kiss at parting, the caressing touch—
What shriven peace to me the memory brings!
 And weeping at your open grave today,
No single pang because I did too much!
 —Myrtle Reed, in Harper's Bazar.

HOMELY HINTS.

To promote longevity fill your little daughter's doll-head with cotton before it is attached to the body and you will find that the eyes will not fall in, and the danger of breakage from falls will be reduced.

It will be found economical if a large piece of cheese is bought at a time. Brush it over with a thin coating of fresh butter to keep the cut parts soft and fresh, and then wrap it in paraffin paper.

In goods which fray easily, it is a great help when making buttonholes to stitch twice around on the sewing-machine before the hole is cut, as a firmer foundation is insured, and no unsightly fraying results.

One way to avoid a possible cold.—After one has applied a mustard poultice, it is a good plan to rub that part of the body with camphorated oil to avoid the possibility of incurring cold.

It is said that the best way to take castor oil is in the juice of an orange, to avoid any taste of the oil. Another way is to put it in capsules. In lemon juice is a good way, as it is not unlike salad dressing. In soda water with a lemon or lime flavoring is an excellent method. Another excellent one seen recently recommended the use of ice, before the dose is given. A colorless, odorless variety of the oil is obtained, and the dose of this is covered with orange juice. Before the medicine is given, the patient chills his mouth thoroughly by chewing cracked ice. The medicine may then be given without leaving a disagreeable taste. By chilling the mouth first the oil will not leave an oily film which is responsible for the tenacity of the unpleasant taste.

"Pins by the pound," are perhaps as out of the ordinary as "buttonholes by the yard," but they may be purchased in this way at a great saving. Half-pound boxes of pins are sold for 25 cents, and contain more pins than five of the ordinary packages. Besides the economy of the purchase, there would be the added advantage of never having to hunt for a pin, with this generous supply at hand.

A woman whose husband objected to wiping the dishes for her because "it isn't a man's work," read to her surprised helpmeet from the Bible. 2 Kings 21: 13, "I will wipe Jerusalem as a man wipeth a dish, wiping it and turning it upside down." He has meekly wiped the dishes ever since.

Occasionally a cream sauce or soup suddenly curdles just after the salt has been added. This shows that the milk was not perfectly fresh. The safer way, when one is uncertain of the milk, is to add salt just before serving the sauce or soup.

EASY TO CLEAN

Prices 60c. to $3.50

Liberty Lanterns

The cut above tells the story—look at it. One hand lifts the "hood," the other removes the globe. Now lift the burner from its place—wipe it—slip in a new wick—rub globe and lamp free of accumulated oil and lamp-black and replace parts. Now your Liberty Lantern is clean, safe, ready for business. Could anything be easier?

Liberty Lanterns give a powerful light. Every well-known and some exclusive improvements are embodied in Liberty Lanterns. Ask your dealer about them.

He—It has been said that a woman can make a fool of any man. Do you believe it? She—Of course not. The best she can do is develop him.—Chicago Daily News.

THE CHILDREN'S TABLE MANNERS.

"After a long illness in the hospital, I returned home to find that my children's table manners had suffered a complete demoralization," says Woman's Home Companion for June. "They 'gobbled,' used knife and fork indiscriminately and always awkwardly, regarded their spoons as shovels and, in short, were perfect little savages.

"In order to remedy this quickly I started a series of 'company luncheons,' at which I was the hostess and the children the guests. I set the table as prettily as possible and made funny little place-cards. The children played up delightedly, took grown-up names and even washed their hands without a murmur. We made a set of simple rules: The guests who behaved perfectly received three pieces of candy, the guests who made only one mistake received one piece of candy. while any unfortunate guest who committed three breaches of table etiquette received no candy at all.

"Questions on table manners were in order at any time, to be answered by the hostess.

"I chose dishes for these luncheons which are not always easy to eat elegantly, and I was very happy to see how quickly the children improved in table manners and other manners as well, for our 'company luncheons' seemed to help general courtesy quite wonderfully. The best of it was that there were no nagging nor cross words. It was all in good fun, and my four youngsters can now go anywhere and eat anything, and mother has the proud consciousness that they will always appear to good advantage."

REAL BOSTON BEANS.

Soak one quart of pea beans in cold water over night. In the morning put them into fresh cold water and simmer until soft enough to pierce with a pin, being careful not to let them boil enough to break. If you like, boil one onion with them. When soft turn them into a colander and pour cold water through them. Place them with the onion in the bean pot. Pour boiling water over one-quarter of a pound of salt pork, part fat and part lean; scrape the rind until white. Cut the rind into one-half inch strips; bury the pork in the beans, leaving only the rind exposed. Mix one teaspoon of salt—more if the pork is not very salt—and one teaspoon of mustard, with one-quarter of a cup of molasses. Fill the cup with water; when well mixed pour it over the beans; add enough more water to cover them. Keep covered with water until the last hour; then lift pork to the surface and let it crisp. Bake eight hours in a moderate oven.

OUR MANY SELVES.

The organization of the human mind is fully as complex as the organization of an army, so various are the moods, so multiform the characters under which each individual may show himself, so hard is it to insure action as a unit, so great is the danger of disruption and dissociation into inharmonious elements.

"Within my earthly temple there's a crowd;
There's one of us that's humble, one that's proud;
There's one that's broken-hearted at his sins,
And one that cares for naught but fame and pelf.
There's one that loves his neighbor as himself,
And one that, unrepentant, sits and grins;
From much corroding care should I be free,
If once I could determine 'which is me.'"

Nervous breakdown is one of the results of not knowing "which is me," or how "I" in a given emergency may act.

PRUNE SALAD.

Prunes served as a salad are a novelty that is decidedly worth trying. The prunes, after cooling, are candied with walnuts or pecans, put on the crispest, palest lettuce leaves and dressed with a dressing having twice the amount of lemon juice as it has oil, and mustard, celery salt and pepper. It's a delicious salad.

New High Grade Automobiles
at Prices Lower Than the Price of Medium Grade Cars

To Prospective Automobile Buyers:

You naturally wish to purchase the highest grade car you can ge for your money, and you naturally want a higher grade car than th dealer can afford to sell you for the amount of money you wish t pay—we will meet your views for a short time.

We have a limited stock to dispose of—all high grade—and al prices to meet the needs of moderate priced car buyers.

Whiting, Davis and Westcott Cars
in Two and Five-Passenger Models

Hay.

Scott, Magner & Miller say:

There has come in to the San Francisco market during the week just past 5300 tons of hay. There has been considerable difficulty in most of the hay sections to obtain cars for loading. The market generally has a good, healthy tone. Hay prices are not higher than they have been, but good grades of horse hay have moved off a little better and more readily than heretofore. There has been very little fancy quality offering, and such consignments have been placed readily at top figures.

The demand for hay for shipment along the Coast and to the Hawaiian Islands has been fairly good, and considerable lately has moved out of the Golden Gate ,and it is expected that this trade will continue right along and relieve our market to some extent.

Alfalfa hay continues steady under heavy arrivals. The demand for this article has been decidedly brisk, and the arrivals have been readily taken care of on orders.

Fancy wheat	12.50@13.50

Shorts	29.00@32.00

Deciduous Market

SACRAMENTO, October 8th, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, October 7th, 1910:

Peaches.

One car. For the past six days there have been no shipments of peaches at all and it is expected that the one car, which left September 30th, will be the last car of this variety for the season of 1910.

Pears.

Fourteen cars. The last of the winter pears are now going forward and there will probably not be more than ten to fifteen cars in the state after this week.

Grapes.

Four hundred and fifty-eight cars. Movement of grapes this week compared with that of last week, when a total of 611 cars was reached, shows a material falling off. This will probably be true of the following week and it is expected that there will be a corresponding decline during that time. From present indications the next ten days will practically wind up Tokay shipments, after which there will be a few hundred cars of Emperors and Cornichons to move. All trace of rain damage has disappeared and remaining stock should show first-class keeping qualities.

Weather conditions continue favorable, being warm and pleasant, and at this time there is no indication of rain. The season has been a very favorable one for moving out the grape crop.

Citrus Market

LOS ANGELES, Oct. 12, 1910.

The Valencia market remains exceptionally strong in every section of the country, and the nearing of the close of the season shows that without qeustion every Valencia yet to ship will command the top of the market. Small prices will occasionally affect the local situation slightly, but on the whole a most satisfactory condition prevails.

Lemons still continue to command high prices, with very few foreigns arriving and fewer Californias available. For another month or possibly two this condition will continue, and every lemon which can be cut will command a satisfactory price.

Shipments.

Total shipments of citrus fruit to date since November 1st, 1909, 29,664 cars, of which 25,031 were oranges and 4.633 lemons. To same date last season, 37,493 cars, of which 31,434 were oranges and 6,064 lemons.

NEW YORK, Friday, Oct. 7.—Offerings today consisted of three cars oranges and one car mixed. Market steady on oranges, strong on lemons. Someclass, Stewart F. Co..........4.40

Lemons—Crown, fy., Sparr F. Co., 6.70; Crown, $6.40.

CHICAGO, Friday, Oct. 7.—Lemons remain steady and have a fair sale. Boxes, California choice, $4.75@5.00; extra choice, $5.50; common, $4.00@4.50.

Oranges, steady with offerings small. Grapefruit ruled easy. Boxes, late Valencia, extra choice, $4.25@4.50; choice, $3.75@4.00; grapefruit, Florida crate, $3.50@4.25.

CINCINNATI, Friday, Oct. 7.—Cool. Market declining. One car Valencias sold.

Valencias—El Capitan, S. A. Ex., $2.45.

PHILADELPHIA, Friday, Oct. 7.—Two cars Valencias sold.

CHICAGO, Monday, Oct. 10.—Lemons, firm. Fair demand, but small offerings. Boxes, California choice, $5.50; extra choice, $6; common, $5.

Oranges—Quiet, demand and offerings limited. Boxes, late Valencias, extra choice, $4.25@4.50; choice, $3.25@3.75; grapefruit, Florida, crates, $3.55@4.25.

PHILADELPHIA, Monday, Oct. 10.—No sale of California citrus fruits at auction here today.

NEW YORK, Tuesday, Oct. 11.—The opening sale, which consisted of seven cars of Valencias, started with a very steady tone, which was inclined to turn into an upward tendency. If this cool weather continues present values will be well sustained and the probabilities are that good fruit will continue to advance until supplies from Porto Rico and Florida become more plentiful. At present California is the only source of supply and that supply is rapidly becoming more, limited. California growers should move whatever stock they now have on hand as the present market conditions are at their best and will continue only so long as the market remains free from the Florida and Porto Rican competition. After that values will begin to fluctuate and prices will suffer a decline which will be governed according to the law of supply and demand.

VALENCIAS—	Avge.
Aurora, Fy. Or., E. Peycke Co.	$4.60

Honest Pack, Tustin P. Co.	3.75

CHICAGO, Tuesday Oct. 11.—Lemons—Firm market exists. Demand is fair and there is only a very limited supply. Boxes, California choice, $5.50; extra choice, $6.00; common, $5.00.

Oranges—Demand is tame and there are only light offerings. The market continues steady. Boxes, late Valencias, extra choice, $4.25@4.50; choice, $3.25@3.75; grapefruit, Florida, crates, $3.50@4.25.

BOSTON, Tuesday, Oct. 11.—One car sold. Favorable. Market steady.

Valencias—Squirrel, $2.90; AH., Prenda, $2.90.

PITTSBURG, Tuesday, Oct. 11.—One car sold. Favorable. Market firm on good oranges.

Valencias—Bear, OK. Ex., $3.95.

The up-to-date farmer is a live wire, and nowhere does he display greater business sense and foresight than in continually increasing his working farm capital represented by improved machinery.

Commission houses always prefer clean eggs to those that are soiled, and will pay a larger price for them, because they are more salable.

Fowls while moulting are in a debilitated condition hence should be given extra care and a nitrogenous ration. Especially should they have access to green food.

Constant care and attention is the least we can bestow on our poultry with any prospect of success. The illusion that some things may be slighted is the bane of prosperity. What is worth doing at all is worth doing well. A single mishap may ruin all calculations for a whole season. Don't be afraid to be called fussy by your neighbors. They will leave off the term when they see results.

SPREAD OF THE ORANGE GROVES.

In four decades, Southern California has been transformed from a land of cattle ranges to one of orange groves. In a third of a century the citrus industry has grown from a single carload shipment to thirty-eight thousand. Of the twenty million boxes of oranges annually consumed in the United States, California supplies twelve million five hundred thousand. The receipts from the citrus crop for the season of 1908-9 were over $30,000,000.—J. M. Quinn, in the October Pacific Monthly.

For success animal food in some form is a necessity. Try the experiment of feeding two yarded flocks, eliminating animal food from the ration of one flock, and note results. More eggs from the flock that has had meat in some form will be a sure result.

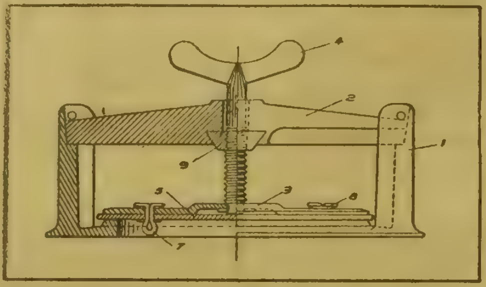
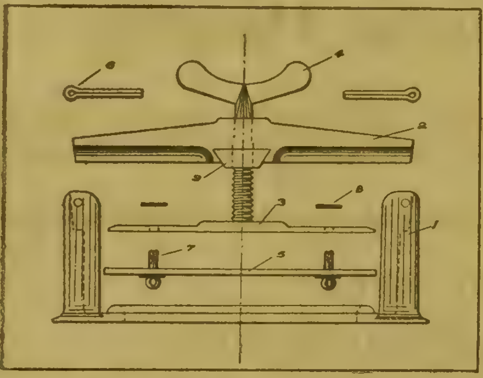
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

THE PIGEON FARM OF A HUNDRED THOUSAND SQUABS

The Greatest Pigeon Squab Farm in the World.

A SHOW FEATURE OF SOUTHERN CALIFORNIA.

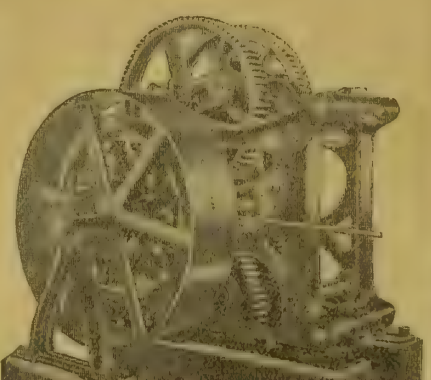
Los Angeles is distinguished for something more than climate and tourists; among the lesser attractions is her possession of the largest pigeon squab breeding farm in this country—an enterprise that not only represents a considerable investment, but one which "makes for business" in a community that boasts of more than one line of industry peculiarly its own. The Johnson Squab Farm is situated just north of the town in the bottom of the Los Angeles river, close to where the Arroyo Seco debouches into it. The number of birds bred annually runs upward of a hundred thousand. Marketing is done daily. The consumption of feed also goes up into the hundreds of tons annually, averaging two tons a day. The business has been exceptionally profitable ever since its founding, now some twelve years ago.

Among professional squab breeders the Homing pigeon easily occupies first place. It is alert, erect of carriage, bright eyed, full breasted, square shouldered, large throated and a good feeder—all characteristics of first importance in pigeon squab farming. In addition it is active, prolific and of good constitutional vigor.

Among breeders the claim is often made that one pair of pigeons will produce from 10 to 12 pairs of squabs each year. In newspaper vernacular this would be important if true; but the facts are that on an average the number will go from six to nine pairs. The prices for squabs vary more or less in different markets, a fair average being from $3.00 to $4.00 per dozen.

Squabs should be marketed with empty crops. In the harvesting of the birds all those of suitable size are taken from the nest and placed in a hamper. Water being available, the operator has the hamper at his side, and a suspended iron ring by a cord to which four strings of the desired length are attached. A bird is taken from the hamper, the noose slipped around both feet with both wings crossed over the feet. The picker then inserts the blade of the killing knife into the roof of the mouth, piercing the brain, and drawing it forward severing the arteries of the head. First the lower half of the breast is picked, then the upper half, next the back of the bird, and last the wing feathers. This rough picking is followed by a second going over the carcass with a small knife, removing all the pin feathers. When finished the squab is dropped into cold water to remove all animal heat, and it is ready for market.

The Smooth Running Pomona Deep Well Pump



RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

Awards and Premiums at Watsonville Apple Annual

CLOSE COMPETITION MAKES CONTESTS INTERESTING

The Watsonville Apple Show closed as it had opened, with greatest praise of all who saw it. Three days of the mid-week of the show brought a very great disappointment in a continued downpour of rain. This not only kept away the vast throngs who would have added to the value of the show, but destroyed decorations along the streets, and through leaking of the tents in which the greater part of the exhibits were, destroyed their beauty. Several of the entries in the car-lot class were so soaked that repacking was necessary. Notwithstanding the rain, the attendance, especially in the evenings, was good, and excepting as to financial returns, the greatest of satisfaction prevailed. The most valuable asset secured from the effort is the advertising and the inspiration to produce and pack finer fruit. People visited the show from many parts of the East, one trainload of bankers stopping to take a look in. Of course fruit growers from all parts of California were in attendance. Oregon apple men were conspicuous by their absence and many references were heard to the statement of the Portland Oregonian that all Pajaro Valley had on which to produce apples was a strip of sand and a few scraggly trees irrigated with dish water from the kitchens of the Valley. Governor Gillett expressed regret in his opening remarks that the author of the editorial in the Portland Oregonian could not be present to inspect the exhibits.

The success of the effort will mean that the exhibition will remain true to name, that is, it will be an "Apple Annual." Heartiest appreciation was expressed for President Stoesser's efforts and those of the board of nine directors who gave of their time and money in greater measure than any others in the city to bring about this complete success. Notwithstanding the disappointment caused by the storm, it is probable another season will see a still bigger show. It is possible it will be held earlier for two reasons; first, on account of the greater probability of settled weather, and second, as expressed by Judge Rowe, it would have greater advertising value from the standpoint of the fruit seller. He referred to the fact that Eastern fruit shows had learned the lesson of holding exhibitions at the very opening of the shipping season. This gives opportunity for the larger buyers to visit and inspect the quality of the fruit and place orders for the entire season. These points will be considered by the future board of directors.

Naming the Winners.

It seemed a near tragedy, the naming of the grand sweepstakes winner in the carlot class. Fourteen cars had been eliminated through the careful score-card system of the judges. Of the two between which the final choice lay one was a superb bunch of 600 boxes of Sebastopol Spitzenbergs, the other a mixed car of Watsonville Bellflowers, Red Pearmains and Newtowns entered by Alaga Bros. of Watsonville. Sonoma county, two hundred miles to the north, or the home county of Santa Cruz, which would win? The footings on the cards showed the mixed car of Alaga Bros. to have the magnificent score of 93 points, the footing of the Spitzenbergs of the Sebastopol Apple Show Association to have just one-third of one point less. It developed that had there been one defective apple less in the Sebastopol car and in its place a perfect apple, the silver cup, two gold medals and $250 in coin and all kinds of honor would have been Sebastopol's.

Messrs. Newcomb, Swan and Hotle of the Sebastopol committee were broken hearted, but the figures wouldn't lie and they took their medicine like men.

THE APPLE SCORE CARD.

100 a perfect score.

The Judges allowing 75 for perfect fruit.

10 for uniform size.

10 for color.

5 for pack.

Score off 5 points for each wormy apple.

Score off 1 point for any other imperfect scab or scale on apple.

Score off 1 point for loose pack.

Score off 1 point for lack of perfect pack.

The judges placing the awards in the above and all quality classes were Geo. E. Rowe, presiding judge, editor of Fruit Belt, Grand Rapids, Mich.; Geo. C. Roeding, nurseryman, Fresno; Mr. Levy, fruit buyer, San Francisco.

Other Carlot Winners.

Best car Newtown Pippins, M. N. Lettunich.

Bellflowers, MacDonald & Sons.

Red Pearmains, L. P. Cikuth.

White Winter Pearmains, Loma Fruit Co.

Langfords, Frank Radovan.

Spitzenbergs, Sebastopol Apple Show Association of Sebastopol, Sonoma Co.

Mixed Car, Alaga Bros.

Feature Exhibits.

J. A. Filcher of the State Board of Agriculture judged the feature exhibits. The awards were:

1. San Monte Fruit Co. The Kiss of the Oceans, a great reproduction of the Western Hemisphere in apples.
2. Japanese Association. Battleship Pajaro.
3. Watsonville High School. High School Building.
4. MacDonald & Sons. American Flag in apples.
5. Loma Fruit Company. Windmill.
6. Order of Eagles. Eagle.

Other features were given honorable mention and Mr. Filcher wished particularly to refer to the "Apple Transformer" of the Sebastopol Association. He made no award to it because of the fact that it is not constructed of apples.

He further stated: "In comparing and estimating the merits of these exhibits as special features, the quality of the fruit used in executing the designs was not taken into consideration."

Individual Prizes.

The remaining awards, consisting chiefly of individual exhibits, are as follows:

The Sebastopol Gravenstein Association's ten box display of Gravensteins received the sweepstakes prize of the gold cup offered by the lawyers of this city and was among the following awards which were announced yesterday by the judges of exhibits at the apple annual who have finished their work upon the ten box lots.

The balance of the awards were: Best ten boxes Bellflowers, first $50 cash, Watsonville Band and gold medal to L. W. Hardy and second prize of silver medal to S. J. Duckworth; best 10 boxes Newtown Pippins, first $50 cash by Watsonville Savings Bank and gold medal to J. D. Copeland, whose exhibit made a perfect score of 100; second prize silver medal to Sebastopol Gravenstein Association; best ten boxes Winesaps, first prize gold medal to Lettunich Bros. and second prize of silver medal to M. V. Quick; best ten boxes Kansas Beauties, first gold medals to Dr. C. E. Beebee of Woodland whose exhibit was the only one in its class; best ten boxes Jonathans, first gold medal to Sebastopol Association, whose exhibit made a perfect score of 100, second prize silver medal to C. L. Robertson; best ten boxes of White Winter Pearmains, first gold medal to S .J. Duckworth who scored 100; second silver medal to G. F. Gallagher; best ten boxes Hoovers, first gold medal to Sebastopol Association whose exhibit was the only one in its class; best ten boxes of Baldwins, first 25 pounds Arsenate of Lead offered by California Spray Chemical Co. and gold medal to Mitchell & Goodall, second silver medal to Sebastopol Association ten boxes of Gravensteins, first gold medal to Sebastopol Association which exhibited the only display of its class and scored 100; best ten boxes of Spitzenbergs, first gold medal to California Fruit Packing Co., second to Sebastopol Association; best ten box exhibit of Red Pearmains, first gold medal to A. Scurich Co., second silver medal to Mitchell & Goodall; best ten boxes of Langford Seedlings, first 25 pounds Rex arsenate of lead offered by Rex Spray Co. of Benicia and gold medal to Mitchell & Goodall; second silver medal to Frank Radovan; best ten boxes Winter Bananas, first gold medal to Mitchell and Goodall whose exhibit was the only one in its class; best ten boxes Smith Ciders, first and only award to M. V. Quick of gold medal; best ten boxes Rome Beauties, first gold medal to R. E. Sherman of Eldorado county whose exhibit was the only one in its class and scored 100; best ten boxes Wagners, first and only award to Sebastopol Association, gold medal; best ten boxes Ben Davis, first gold medal to J. E. Hassler; best ten boxes Missouri Pippins, first gold medal to M. N. Lettunich Co.; best ten boxes Arkansas Blacks, first gold medal to only entry, Sebastopol Association; best ten boxes of mixed varieties, first silver trophy cup offered by Adriatic Publishing Co. of San Francisco, one barrel Ortho Lime Sulphur Solution by California Spray Co. and gold medal to Sebastopol Association who scored 100; second silver medal to Ira J. Phillips.

For the best exhibit of apples made by any exhibitor residing more than 100 miles from this city the Sebastopol Association was awarded $25. For the best ten boxes of red apples from any district outside Santa Cruz and Monterey counties R. E. Sherman of Eldorado county was awarded $10.

Box-Making Contest.

For the closing evening of October 15 the first world's championship box-making contest ever held was witnessed in the pavilion. It lasted one hour and Homer Poore of the San Monte Fruit Company was the winner, having put together and fully nailed ninety-three apple boxes in sixty minutes. The contestants and their scores were:

Homer Poore, San Monte Fruit Company, 93; T. Corrison, 87; Paul Johnston of Soquel, 81; Harry Taylor, MacDonald & Sons, 80; Peter Fisher, Frank Radovan Company, 76; Hugh McGowen, M. N. Lettunich Company, 74; Archie Bloom, San Monte Fruit Company, 71; B. P. Eastabrook, 67; Charles Cullinson, 61; Ben Church, 60.

The judges were C. R. Greison of Hood River, Ore., who is assistant editor of Better Fruit; J. W. Turner of Sebastopol and C. E. Hotle of Sebastopol.

As Seen by the Judges.

Mr. Levy said he had never seen equal quality and quantity of apples brought together in such an exhibition. His life has been spent in handling fruits, of which a large percentage has been apples, and he was unqualified in his praise of the uniformly good fruit. He, however, deplored the fact that some inferior fruit was used in the feature exhibits. These were not entered on a quality basis, but notwithstanding that the fact was adversely commented upon that every one of the feature exhibits showed inferior fruit, and not only showed it but gave it prominent place. The High School exhibit may be referred to as illustrating this point. The roof was constructed of Red Pearmains and was entirely of cull fruit. They answered well enough for a tile roof imitation but in an apple show in an apple country such a grade of fruit should not be used.

Mr. Geo. E. Rowe of Grand Rapids, Michigan, who has judged similar exhibits for years—in fact, he told the writer that he averaged about five similar exhibits annually—remarked that he had never seen an exhibit of apples which would come up to this one. The carlot entries were an entirely new feature in his experience, the ten-box and plate exhibits being the more general form in the Eastern fairs. While Mr. Rowe had a criticism for some of the entries, he felt that the general standard should be raised, yet the exhibit was really remarkable as made. In fact, that is one thing which will be accomplished by the competition.

Apple Annual Notes.

The number of varieties exhibited was a conundrum, for there was no record keps as to this point. One exhibit, that of Tuolumne county, and one of the smaller ones at that, showed on actual count 52 varieties on plates. Guesses as to number of varieties vary from 30 to 150.

One of the handsomest little exhibits was that of Tuolumne county. One Pajaro Valley grower was asked if he had seen it. He quickly replied, "I haven't seen anything else." The apples were of magnificent color, perfect in form, and crisp and delicious of flavor. If Tuolumne has any great acreage of land adapted to growing similar fruit, she will be heard from with a louder voice than at this exhibition.

Apples are usually packed in boxes 9¾x11x22. Some packers prefer to put their 3½ tiers in a special box, 8¾x12x22. This contains practically the same number of pounds of fruit while allowing a more attractive pack of the large apples. The 4-tier apple is one which fills a ring 2⅝ inches in diameter.

TREES

"Jock, when ye hae naething else to do, ye may be aye sticking in a tree; it will be growing, Jock, when ye're sleeping." —Sir Walter Scott, in the Heart of Midlothian.

The rainy season has begun and with it comes the thought of tree planting.

Every prospective planter of trees or vines should have

The Fruit Growers' Guide

By Geo. C. Roeding

120 pages, 7¾ by 10¾. Beautiful lithographed cover. Profusely illustrated with half-tone engravings and color plates. It not only lists but describes 2000 varieties of trees and plants. Contains valuable suggestions on soil, preparation, planting, cultivating, irrigating and pruning. Price, mailed, 25 cents.

For more than 25 years we have been growing nursery stock in this state, and we believe you will find that our experience and suggestions will be of value to you.

Plant Fancher Creek Nursery True-to-Name Trees

And you will have nothing to regret.

Our nursery embraces over 1500 acres, located in the most fertile and favorable spots in all California for the propagating and growing of first-class nursery stock of every description.

Deciduous, citrus, ornamental trees, grape vines, palms and roses.

PAID-UP CAPITAL $ 200.000.00

Citrus and Tropical Fruits

MITES, OR SO-CALLED SPIDERS, AFFECTING CITRUS.

By A. W. Morrill, Entomologist, Arizona Horticultural Commission.

The three pests which are discussed in this circular are commonly called the rust or silver mite, the six-spotted spider and the red spider. It is probable, as will be shown, that citrus growers in Arizona have more reason to fear the introduction and successful establishment of these pests than any others.

All three pests are mites, strictly speaking, and not spiders, although the Acarina, or mites, are more closely related to spiders than they are to true insects. They are all prevalent in Florida, no section of that state being immune to their injury. They were introduced into California about twenty years ago on nursery stock, the rust or silver mite being reported from San Diego county only, while the red spider and the six-spotted spider are known to occur in San Diego, Orange, Los Angeles and Ventura counties.

The name "rust mite" is used in Florida where the principal injury of the pest is in giving the rind of the oranges a russet appearance. To avoid this injury many of the best growers spray their groves from three to five times a year. Others consider that the russetting does not affect the selling value of their fruit. In California the same pest is known as the "silver mite," on account of its injury to the rind of the lemon. The injury to lemons is much more serious than to the orange, silvered lemons being unsalable.

The rust or silver mite is so minute as to be almost invisible to the naked eye, full-grown specimens measuring about one two-hundredths of an inch in length. More than 1,000 specimens of the mites and their eggs were counted by one investigator in a square inch of leaf surface. Direct sunlight is unfavorable to these pests and the same holds true of dense shade. Half shade, however, favors their multiplication. Practically nothing definite is known at present concerning the effect of climatic conditions upon the rust or silver mite. A close relative, the pear leaf blister mite, was observed by Prof. T. D. A. Cockerell at Tempe and Mesa, Arizona, on pears several years ago. In Bulletin 32 of the Arizona Agricultural Experiment Station he states that the mite did not appear to cause any injury.

The six-spotted spider ranks high as a citrus pest in Florida. This mite feeds upon the leaves, causing them to turn yellow and fall. The writer has seen trees in Florida shed fully 60 per cent of their leaves from injury caused by this pest. The amount of damage varies from year to year, depending upon climatic conditions. The mite requires hot, dry weather in order to thrive best, and in Florida it usually accompanies spring drouths, quickly disappearing with the beginning of the summer rains. The evidence at hand shows that this mite would probably prove a serious pest in a dry climate, if it should become established.

The red spider is closely related to the six-spotted spider. The former species seems to be more destructive in California than in Florida. Within the past month the entomologist of the commission inspected a sample shipment of citrus trees from a reliable Florida nursery, bearing a certificate of fumigation with hydrocyanic acid gas. These trees were more heavily infested with living red spiders, in all stages, than in any case previously seen. It was estimated that there were upwards of 2,000 eggs and crawling mites of different sizes on each tree. Like the six-spotted species, the red-spider is favored by dry weather. It is therefore considered inadvisable for our citrus growers to risk acquiring definite information concerning its ability to thrive here.

Natural enemies do not play an important part in the control of the mites here dealt with. Neither fumigation nor sprays with the oil and soap washes have been found to be effective against them, on account of the resistance of the eggs to these remedies. Sulphur in dry form or in solution is a substance to which mites are peculiarly susceptible, and dusting or spraying with sulphur mixtures or solutions is relied upon for their control. The eggs are not affected, but the sulphur remains on the leaves where the young mites, as they hatch, may come under the influence of the fumes which are slowly generated by chemical changes.

INFLUENCE OF EARTHWORMS

The food of earthworms is humus matter; to obtain this, they have to assimilate large quantities of earth which is obtained from the subsoil, and contains, generally, only about one per cent. or less of humus. The earth, while passing through the alimentary canal of the worm, is subjected to the action of its digestive juices, which dissolve out the humus and render the mineral particles more soluble to the carbonic acid water of the soil. It is then excreted at the surface of the ground during or after rain.

Darwin calculated from actual observation that in humid climates, in a soil fairly stocked with these worms, the earth thus brought up may amount to from one-tenth to two-tenths of an inch annually over the entire surface. He further estimated that in this manner ten tons of dry earth, per acre, annually pass through the bodies of earthworms and are brought to the surface.

Apart from the mechanical effect worms achieve in loosening the soil, the entering of air and water in their burrows, and the chemical effects arising from the digestive process and the final return of their own substance to the soil are of great value. Their habit of drawing after themselves leafstalks, blades of grass, and other vegetable remains into their burrows, is another means of improving both the physical and the chemical properties of land. The uniformity, lack of structure, and loose texture of the surface soil, especially of forests as compared with subsoil layers of corresponding thickness, is doubtless largely due to the work of worms.

Another important point is that, in soil thrown up by earthworms, the humus formed under their influence is always of a neutral character and never acid. The work of earthworms is especially effective in loamy soils and in humid regions. In the arid regions of the earth, and in sandy soils generally, the life conditions are unfavorable to the worms, and the perviousness elsewhere brought about by their labors already exists naturally in most cases.

It is stated by Mr. E. T. Seton (Century Magazine, June, 1904) that the earthworm is practically non-existent in the arid regions between the Rocky Mountains and the immediate Pacific Coast from Manitoba to Texas. In the Pacific Coast region, however, it is abundant, and does its work effectively.

It has been calculated that an acre of ordinary agricultural land contains about 50,000 earthworms. The effect of their combined labors in reducing the soil to a finer condition, as we have seen, is great, while they also enrich the surface soil in nitrogen. In old pastures, the production of a close, compact sward is largely due to the fine earth which is brought to the surface by earthworms, to be afterwards crumbled down and leveled by the action of wind and sun.

When the earthworm casts are being constantly swept up and carried away from lawns, cricket grounds, and putting-greens, the surface soil gradually becomes exhausted of fertility, the grasses die out, and mosses take their place.—The Gardeners' Chronicle.

Tree and Shrub Fruits

THE TILTON APRICOT.

Six years ago last spring I bought 650 Tilton cot trees which I planted on part of the lightest soil on my farm near Hanford, took care of them, plowing them as often as needed, not less than four times and part of them several times, the first year, so as to kill the Johnson grass, and the trees made a very fine showing. I ran water just along the rows as soon as planting was done. That was six years ago last spring, and last July, one year ago, after I had taken off the crop of fruit, I turned in and irrigated the 648 trees, there being just six acres of trees, 20x20. This is the only time I have irrigated these trees since they were first planted. In 1908 I harvested my first cot crop, the trees were four years old. They produced that year 19,447 pounds, sold at 6⅜ cents per pound, bringing $1,239.75. I sold 50 pounds to one of my friends for 7 cents, $3.50, and the pits I sold for $21.80, making a total from four-year-old trees of just $1,265.05 or $210.84 per acre. In 1909 I received from this same six acres $2,257.40 or $376.24 per acre. This year, 1910, I received $1898 or $316.33 per acre. There were just 2179 fifty-pound boxes of apricots cut, at the price of 8½ cents dried. This gives a total for these Tilton cot trees, the first three years of their bearing, of $903.44 per acre. I find that this variety of cots can be handled with the slightest loss of any other cot, it being of a very dry quality. I also found by actual shipment that these cots can be picked from the trees just as you would pick for drying, wrap them in paper, place them in a 25 or 50-pound box such as is used for picking, place them in an express car, ship them to Denver, Colo., or to Topeka, Kansas, without using any ice and they will go through as fine as silk. I tried it this time while I was in Denver and Topeka keeping on ice for one week. I could have sold my entire crop of fresh cots in Denver at a fancy price had I been ready to have taken care of them. I have had these cots to drop off the tree and remain firm for three days, and I have had them remain in the picking box (50 pounders at that) for three and four days after they had been picked. In conclusion, I would say this is the only cot to plant to compete with time. It dries heavy, it is just like wax when cured properly, and it is a beauty in every way. —S J. White, in Hanford Journal.

SHIPPING FRESH FIGS.

A news item from Dinuba gives a pretty good idea of what the future may have in store for the farmer who has this delicious fruit for sale. We learn that Superintendent Rixford, of the Chico Agricultural Experiment Station, recently came to Dinuba to investigate the matter of the shipping of Calimyrna figs from here to the Chicago market. Recently W. D. Smith of Dinuba sent a lot of figs in a car of grapes, and these were sold in the Chicago market for more than 25 cents per pound, netting 21 cents per pound. That Calimyrna figs should be made to reach the eastern markets in good condition was formerly thought to be out of the question, and that Mr. Smith succeeded in shipping by freight attracted the attention of the fig expert of the government station. The latter has sent a large number of fig-cuttings here to Mr. Smith and adds that there is a great future for the fig industry.

APPLE UTILITY AND BEAUTY.

Pruning when tree or plant is in dormant condition tends to stimulate new and rapid wood growth, which is desirable in young trees, while to prune in the early summer season, when a tree is in full vigor of growth, checks wood growth and tends to fruitfulness. Therefore, as a general proposition, trim young apple trees in late February or March when dormant.

It is quite a fad just now to talk about planting dwarf apple trees, especially for the home supply of fruit. I, however, am clearly of the opinion that if the best of standard trees are started with low heads and annually pruned when in dormant condition, with the thought of developing a low, broad, spreading tree, and when this tree has attained a height of not more than ten or twelve feet the after pruning be done in summer, so as to check any further wood growth, you will have a tree which may be had about as easily as dwarfs, and one many times more productive. This at least is to be my practice on nearly three hundred acres of apple orchards on the rocky hill lands of Connecticut, where I am trying to grow fine table apples for the high-class family trade that demands beauty as well as quality, and I want my trees low down where we can easily get at them, in order to put on the finishing touches by pruning, thinning and spraying.

Apple trees will grow well and bear fruit in about every variety of soil, except upon muck swamps and low marshes. The finest fruit as to texture and quality comes from the side-hills and stony hill-tops, where is good, strong, loamy soil, with water, air, and frost drainage, which are essential to securing the finest appearance in the fruit.

A free circulation of air tends to dispel many fungous troubles that mar the beauty of the fruit, and therefore less spraying is required by the hill-top apple trees than those growing in the valleys.—J. H. Hale in Collier's.

DISEASES OF CHERRY AND OTHER TREES.

A bulletin issued by a German agricultural institution speaks of the dying cherry, apple and other fruit trees, in which the following symptoms are usually seen: Wilted, yellowish leaves, meagre foliage, shedding of the unripe fruit, deficient ripening of the fruit on the trees, death of the bark on the trunk and larger branches, death of twigs, and finally the death of each branch and of the entire tree. Associated with the disease, on stone fruits in particular, is the appearance of gum mainly on the dying bark. A cross-section of the diseased limb where the bark is dying shows that the underlying heart and sap wood is colored. This discoloration may be traced from the roots to the smaller branches and twigs, but here the coloring is mainly in the inner heart wood, while the young sap wood, cambium, and bark are as yet sound and healthy. On following the coloring down into the roots, the cross-section of the diseased wood is seen to become less, finally ending in a dead root, usually the taproot, while the lateral roots may be healthy.

This inner coloring of the heart wood seems to be due to bacteria which attack the old and dead cells and spread outward in the older branches toward the bark. On trees thus diseased are found a species of fungus belonging to the genus Valsa (Cytospora), but the author claims that neither the bacteria nor the fungus is the primary cause of the death of the trees but that unfavorable environment and weather and soil conditions weaken the resistance of the trees until these parasites are able to gain a permanent foothold and finally cause the death of the trees.

Protect your crop from frost

This is the ***Troutman Orchard Heater*** and it is no prospect nor experiment, because it has been tested and affords absolute protection. Can you afford to take a chance on losing a crop which has cost you the labor and anxiety of a year? Josh Billings said: "It is no credit to a cow to give a pail full o' milk and then kick it all over." ***Send for descriptive matter*** and horest testimonials. Special prices if ordered this month.

A Superb Farm Wins a Cow

A Sacramento Valley Contest which will Lead to Better kept Farms

A registered Holstein-Friesian cow having the blood of some of the best producing strains of that magnificent breed, is a valuable addition to the small rancher's assets. When such an asset is acquired by an operation which has been in itself profitable and at the same time at no direct cost for the cow, the rancher is indeed "lucky." Such a streak of luck struck a Sacramento valley farmer last week, and as usual it was a case of "luck" following hard work. The cow is worth several hundred dollars of California gold, and the farmer securing her had only to lead her home. Would Cultivator readers like to know this interesting story? It's worth the telling, though it must be short and only in outline.

The Story.

Two years ago representatives of eastern capitalists began looking over the rich lands of the western side of the Sacramento valley and the rich waters of the Sacramento river. Still farther back an effort has been made to take out the waters and apply to the land, which was only well under way when the effort was abandoned because of lack of capital. These lands comprising thousands of acres of the great Glenn ranch in Glenn and Colusa counties were purchased by the capitalists, who were often referred to as the "Pittsburg Syndicate," or as the Kuhn Brothers Company, bankers, of Pittsburg, and again as The Sacramento Valley Irrigation Company. This great concern purchased not only the original canal and land holdings, but other thousands of acres, until now over 125,000 acres is under its ownership.

These lands are now being subdivided and sold in small parcels—usually 40 acres—to home makers. But that story is too long. Now, about the cow story.

In March last the company conceived the idea of encouraging better planned, better kept, better profit producing places on the part of those who had bought property under the system. The idea took concrete form in the offer of a pure bred, registered Holstein-Friesian cow for the farm showing best improvements, best yield, finest arrangement of its irrigation system, neatest arrangement of grounds and proper diversity of products, the contest to end on October 15 and to be decided by three disinterested judges.

On Saturday morning, October 15, the judges, consisting of Prof. E. J. Wickson, dean of the Agricultural College of the State University, B. H. Burton, president of the National Bank of Willows, also of the Colusa County Bank, and C. B. Messenger of the California Cultivator, were taken to the various contesting places by Messrs. Fentress Hill, Manager, D. W. Ross in charge of the engineering force, and W. S. Guilford, director of agriculture for the company.

It was a beautiful Sacramento Valley day, perfect in every respect. Old Shasta's outline far to the north was plainly visible. Lassen peaks appeared closer on the north and east, while Marysville Buttes on the south and the Coast Range on the west, the higher points covered with snow from the recent storm, made a beautiful background on all sides.

The big machine which conveyed the party to the various places left the company headquarters at Willows at nine o'clock, visited the seventeen places contesting for the prize, passed six little cities of the coming empire and covered approximately ninety miles in the two counties of Glenn and Colusa before 3:30 o'clock. Good roads which abound in all save the newer sections were responsible for the distance covered.

The contestants were Mr. Mellhorn with 160 acres, Mr. Davis 20 acres, Wm. Saxton 80 acres, L. O. Custer 20 acres, E. E. Wood 20 acres, Mr. Lambert 100 acres, Mrs. L. Monlux 20 acres, Mrs. Anna Overholtzer 20 acres, Geo. N. Davis 23 acres, W. F. Burt 7 acres, H. C. Dayton, C. E. Congdon 250 acres, F. C. Southam 80 acres, L. L. Grieve 40 acres, W. J. Embly 20 acres, A. R. Horning 10 acres and L. L. Grieve 38 acres.

The Winner.

Each judge kept his own score card on each place and independently each placed the winning score on the smallest farm of the bunch, the seven-acre place of W. F. Burt. This place is directly under the levees of the Sacramento and on exceedingly fine, rich land. It is a good sample of intensive farming accomplished by the farmer's own labor and that of his family. Besides a living for his family Mr. Burt has banked over $1700 during the past year. Cows and pigs, fruit trees, garden truck, small fruits, poultry and even several stands of bees in a stray corner indicate that Mr. Burt makes the most of every item on the ranch. Besides the place is well kept and neat. The greatest defect, if a criticism is permitted, is that the grounds and approach to the house are not pleasing. One enters through the barnyard, the gate opening to the back door. Therefore in neatness and arrangement of grounds this place was marked zero, but its score because of productive capacity, irrigation arrangement and other features carried it through.

Many others of the places are worthy of hearty commendation, but one in particular, that of Mr. Mellhorn, is entitled to a special mention and even to an award. Unlike Mr. Burt's it is a large place—160 acres. Unlike it again, it is not yet a profit maker, for it was only purchased last spring and the summer has been spent in creating a system of dykes, ditches and reservoir. It is very complete in these improvements, practically the whole 160 being ready for the water. The house and corrals are neat and well built, but unfortunately the house is much too close to the barns. But all told the merit of the arrangement of the place was such that Manager Hill suggested that as a special recognition a likely heifer be chosen from the company's herd and tendered Mr. Mellhorn.

Already plans are under way for another year's contest. It will probably be on a more pretentious plan. It is a most practical method of encouraging careful and painstaking work on the farm and should create a spirit of friendly rivalry which will lead to beautiful and well planned farms on those rich acres.

WATSONVILLE APPLE SHOW NOTES.

Liberal exhibits were made on plates, exhibits of one box, five boxes, ten boxes, 100 boxes and carlots.

Apples of scores of varieties were exhibited, but as one visitor expressed it, there were no apples of discord.

The Panama-Pacific boosters were in line everywhere and the little booster card fluttered from everybody's coat.

An interesting feature was a large tent filled with spraying machines, spraying supplies, orchard implements, and other aids to successful orchard work.

After the rain the decorations along the street took on a dejected look which did not add to the happiness of the Pajaronians, but once the sun came out later in the week, this discordant element was forgotten.

There are 60 large packing houses lining the tracks of the Southern Pacific in the city of Watsonville. At Pajaro and other nearby places are 20 others, making practically 80 large packing houses employing 4000 people during the packing season. Some of the houses employ Japanese in packing, but many are finding the most satisfactory results with women packers.

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 5 to 50 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

O. J. Weber Co. 225-227-229 East Sixth Street

Clip Your Horses

with this superb Stewart No. 1 Ball Bearing Clipping Machine

The great enclosed gear machine at your dealers all complete, as shown,

only $8.50

No machine ever made at any price equals this one. It is the most perfect in every way of all clipping machines on the market.

It turns easier, clips faster and lasts longer. If you have but one or two horses it will pay you to have this splendid machine.

The gears are all cut right out of the solid bar, and all wearing parts are file-hard. It will last a lifetime.

If your dealer hasn't it, write us direct. GET ONE NOW

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FEEDING THE HERD.

By Mrs. M. E. Sherman.

Some men are trying to raise dual purpose cows, that is having a cow that will pay as a dairy animal and yet give her son beef qualities and carefully give to her daughters the same qualities as a milker she possesses herself. Now, some of us do not believe in this cow, for like the man from Missouri we say "Show me" and even go as far as the man from Texas and say "Put it in my hand." It is a noticeable fact that the newer dairy districts have the dual purpose cow idea in their minds. When the dairymen test their cows for butter fat gradually they come to see that a cow that is good as a butter producer is enough without thinking of the value of the beef she carries on her back.

Balanced Ration.

Cows like all living animals are products of the foods they consume. Now the scientific balanced ration is made narrow enough to give the cow all she needs without any wastes. The theory is a fine one but somehow it grows more doubtful as time passes, if it is as perfect a thing as we at first thought. The general welfare of the herd has to be considered. The cow must not be crowded too closely or the general strength will fail. Nearly everyone has widened a little on the standard as laid down by the earlier authorities. Fat in the food we have found out has a value greater than was known. The Jewish people under most adverse system of crowding into Ghettos have shown an immunity to tuberculosis that is remarkable. Food alone can account for this in the way they have been forced to live. The children are fed on fats in large quantities, their diet is over weighted with fat, the result is less intestinal trouble and almost no tuberculosis.

Protein.

A narrow ration in cow feeding is one that contains full amounts of protein and a lessened amount of fat and carbo-hydrates than is fed to the growing animals. A cow in milking is directly responsive to the feed she receives. An experiment, made some time ago, by Prof. Eckles of the Missouri Experiment Station shows how thoroughly the giving of milk may be bred into cows. A cow giving a small amount of milk, twenty-one pounds, was taken while still fresh and given only enough food to maintain her body without regard to the amount of milk she was giving. She was milking twenty-one pounds of milk of 5 per cent richness. She was fed 7 pounds of hay and 3.5 pounds of grain a day. The test was ended on the 29 days as the cow became so weak that it was considered cruel to push the test to the limit, for this cow took from her back and put into the milk pail not only her food but one hundred and fifteen pounds of her own weight of fat. The last part of her test she gave milk that tested 6.9 fat. She gave out that which she did not receive in her food. She was a cheerful giver and the dairyman loves that kind.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

Returns.

If the servant is ever worthy of her wages surely the dairy cow is worthy. The wise dairyman not only feeds the cow giving a full flow of milk but he feeds the cow that is dry. He feeds the fat onto the dry cow's back and knows that when the cow freshens, she will put this accummulated fat into the milk pail. Feed the dairy bred cow well when dry, but beware of feeding the beef bred mixture at this time or the cow will not come to her milk in any quantity when she freshens. The mixture of beef blood tells greatly in handling the feeding of the herd, for the beef animal when she puts on fat, keeps it while the dairy cow turns it back into the pail again.

Increasing Butter.

This way of stuffing the dry cow will increase the returns greatly of butter fat and make a record for her. The only increase in butter fat that can be secured in the healthy cow must come from increased yield of milk. The amount or per cent of butter fat is a fixed quality in the cow. Fever will increase the fat for a time and so will any local derangement by drugs. These are all harmful and not safe to consider even in the Show Ring. I have been asked at several Farmers Institutes if I did not think that when a cow was fed alfalfa solely for a term of years that the per cent of fat decreased in the milk. I could only say, I did not know. Have any of the readers anything to show this to be a fact?

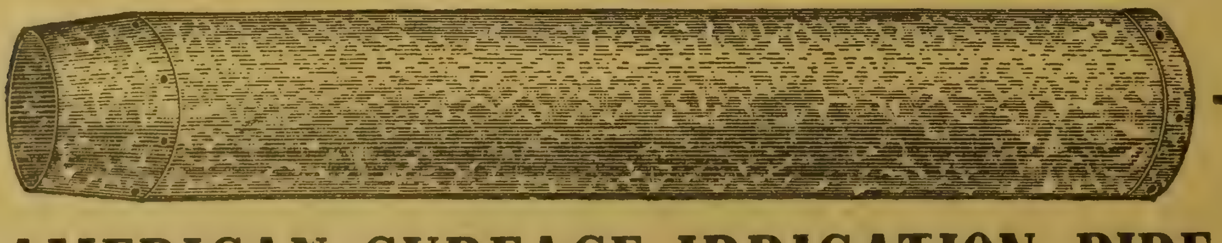
Feeding.

The animals on the ranch are never willfully stunted by lack of feed. I believe that the greatest mistake one can make is not to give them enough to develop well themselves and to give strength to their calves. The cows in the milking string should have a little grain, even when the pasture is good. This, of course, would not apply to common cows but well bred dairy cows. They will pay for the grain every time. The calf that is coming will make a better animal if the dam has never been short on the materials used in building up bone, muscle and flesh. Whenever a calf is dropped that weighs less than eighty pounds in the herd we consider the dam has not been well enough fed. Most of the calves weigh nearly a hundred and a few considerably more.

Burning Up.

The usual idea is that it will burn a cow's stomach to feed her grain all the time. I have not found that a cow's stomach was any more easily hurt than the human stomach. The idea that a large amount of very coarse stuff put through the cow would bring out her full capacity as a dairy animal has to be given up. The grain is simply giving her a smaller amount to digest to secure a greater amount of nutriment. In feeding a common cow increase her feed, until she does not increase her milk flow and then hold her at that point. When she is ready to go dry let her go off the grain feed easily. Watch her and if she falls off in flesh give her a little more grain. When the cow is dry is a good time to widen out her ration for a time, by giving her more fat forming foods.—M. E. Sherman.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.



AMERICAN SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only scientifically constructed **Surface Irrigation Pipe** on the market. No round seams to leak, retard the flow of the water, or weaken the pipe. Cheaper than flumes. Easily handled. ***Will last a lifetime. The correct way to irrigate alfalfa.*** We make Riveted Water Pipe and Tanks. ***Write for illustrated catalogue.***

32 Years of

De Laval

Cream Separator

This is the record of the DE LAVAL machines. which is of itself a mountain of strength beside which the record of other cream separators are but molehills.

It means a feeling of confidence in the purchase of a separator to know that you are putting your money into the machine which was FIRST and which has LED in every single step of cream separator IMPROVEMENT and is today fully ten years in the lead.

It is a satisfaction to know that in buying a DE LAVAL you are not only getting the machine which will DAILY give you the best results, but one of which there are already many thousands an average of TWENTY YEARS in use, while the average life of imitating machines is not over five years and most of the so-called "cheap" machines of today are not likely to last two years.

A De Laval catalogue. to be had for the asking. explains why the De Laval is not only the best but actually the cheapest.

GARGET IN COWS.

Veterinarians and dairy farmers are full of trouble constantly in reference to garget. In some herds it amounts almost to an epidemic. Yet we wish to say this:

In the past twelve years, keeping from thirty to forty cows constantly, we have had but one case of garget and loss of a quarter. That case was with a two-year-old heifer that developed a wonderful udder and we foolishly allowed it to go too long without relieving the strain by milking before calving. Our exemption from garget and stopped teats, we attribute very largely to the fact that each cow has a stall by herself and always a warm bed of clean straw or other bedding to lie upon. We must remember constantly that the udder is the seat of an enormous amount of blood circulation. It must always have a warm bed to come in contact with or else this circulation will be checked, and congestion and inflammation will set in.

It is for this reason that we so strongly urge dairymen never to allow their cows to stand on cold cement floors. We cannot know any too much about this wonderful machine, the cow, for she is the embodiment of the greatest of all mysteries, that of Motherhood.—Hoard's Dairyman.

SALTING AND SMOKING MEATS.

Pork or bacon is specially adapted to salting and smoking; curing it renders it more digestible and wholesome. In the case of beef and other meats the digestibility and wholesomeness is diminished by both salt and smoke. The granular form of fat in bacon is easy to digest and can be eaten by persons to whom any other fat would be intolerable.

Scientific investigation has shown that the use of salt in preserving food has no appreciable influence on health other than favorable. Salting is probably the oldest method known as a dehydrating agent on the flesh, removing water retained in the tissues of the animal body. It is mildly antiseptic in its action, and in this manner aids to preserve. Owing to the large proportion of fat to lean, the flesh of the hog does not take up salt as readily as does other meats.

Just how long hog's flesh must be submitted to the influence of salting must be governed by various conditions. The absorption of salt is slower with hogs having a greater proportion of fat than is usual. The size, thickness, age and weight of the flitches and hams must be considered. Less time is required to cure the meat in a damp cellar than a dry room. The extremes of heat and cold are unfavorable. Great heat is apt to decompose the flesh before the salt permeates it sufficiently to cure it. When too cold, the meat juices become set and the flesh gets too firm for the salt to penetrate. The temperature of the curing room should never exceed 60 degrees Fahrenheit.

Some believe that the flesh should be rubbed with salt every day. This, however, is only necessary for the first three days. It is only required that the salt mixture be spread firmly over the flesh. In the case of large, thick pieces, or when the flesh is very cold, it would be advantageous to rub briskly. Care should be taken that the salt is pressed into every depression and well into the hock ends, where the feet have been cut off, and into the joints. To continue the hard rubbing too long will result in a hardened cured flesh.

Brown sugar is used in varying quantities with salt, in order to correct the hardening influence of salt on the meat. It also has a tendency to render the bacon mellow and increase its juiciness and flavor. Sugar may also be classified among the mild antiseptics as a meat preserver.

Saltpeter is used in curing. It possesses antiseptic properties, but its use is mainly to preserve the natural color of the flesh. The natural color fades when salt alone is used, thus lessening the attractiveness of the bacon. Too much saltpeter will have the effect of unduly toughening the meat. The quantity should be not more than one part to 25 parts of salt

In dry curing the following recipe is recommended:

Fine dairy salt	50 pounds
Brown sugar	5 pounds
Saltpeter (finely ground)	2 pounds

Mix well.

Rub in the mixture over the flesh parts and around the bones and joints for the first three or four days. Then spread the mixture freely daily. The sides should be stacked. Alternate the method of stacking so that the side on the top one day will be at the bottom the following day. It will require about 14 days of this treatment, according to size of the side.

Where a sweet, juicy, mild-cured bacon is wanted the following may be used instead of the foregoing:

Sugar and fine dairy salt, equal parts. Mix well.

To impart a distinctive flavor this famous French recipe is given:

Fine dairy salt	6 pounds
Brown sugar	6 pounds
Allspice	1 pound
Mustard	1 pound
Saltpeter	1 ounce
Bicarbonate of soda	1 ounce

Mix well.

Rub over the flesh daily for three days and afterward spread on each day for 17 days, turning the sides in rotation.

At the conclusion of the dry-salting the flesh is brushed over to remove salt, pieces of fat and flesh, and cleaned up. The side is washed in rain water and soda for 24 hours. This solution is made by dissolving one pound of bicarbonate of soda to 20 gallons of clean rain water. This removes excessive saltiness and makes the curing milder. Follow this by washing in clean rain water. The meat edges and bones are trimmed again. All sharp pieces of bones and loose or hanging pieces of meat are removed, leaving the side neat and shapely. Hang the side up to dry in a room free from dust and insects, with a full current of air for several days. Then lightly rub olive oil over the skin and flesh for smoking.

The smokehouse should be about 12 feet high, as the bacon must hang from 6 to 10 feet from the floor. There should be no light except that admitted when opening the door. Sunlight is apt to bleach the bacon and deprive it of its natural color. Some ventilation is needed, but it should be under control, for the aim is to surround the bacon with a dense atmosphere of smoke at a low temperature. The smoke should be carried to the bacon as cool as possible. To do this care must be exercised in preventing direct heat reaching the bacon. In deciding the length of time to apply smoke, judgment must be used. The desirable color is a light brown tan. To secure this smoking may occupy any period from 36 hours to five days.

Finish the sides now by dressing and rubbing the skin and flesh with pure olive oil.

CROSSING HOGS.

In raising hogs for the pork market there are some advantages to be gained in crossing breeds. Some crosses bring out the srong points of both parents; and nearly always a cross between pure bred animals of different breeds results in increased vigor. Of course violent crosses should not be made; but when two cross breeds nick so well that the cross bred offspring are uniform, crossing offers some advantages.

One should choose his sows from a breed that is long bodied, roomy in their build, and prolific. Even though the sow be somewhat narrow and leggy it will not matter. You want a large number of pigs to the litter and you want them to have plenty of milk, so pick a sow that will give both. Then cross her with a boar of a compact, easily fattening, quickly maturing type, and these characteristics will appear in the offspring to a marked degree, if the breeds are well suited for mating. The Berkshire-Poland China cross is a good one and may be made with either Berkshire or Poland China sows. The Tamworth-Duroc Jersey is very prolific, and some breeders say that when they are crossed with the Poland China they give a longer bodied pig than the latter, and one of great smoothness of outline and with good rustling properties.

Crosses between hogs of different colors are not very satisfactory, because of the broken color, and lack of uniform appearance in the offspring. But here again the Large Black proves strong. We have crossed them with Duroc Jersey sows and with Tamworth sows and the pigs come coal black, another good cross, and in this case it is best to use the Tamworth sows.

Secretary James Wilson, of the United States Department of Agriculture declares sugar-beet pulp is the best butter producer in the world. 40c per ton at LOS ALAMITOS SUGAR FACTORY.

When trees are turning yellow,
  And the sumac crimson glows;
When apples hanging mellow
  From the boughs are tinted rose;
When cornshocks dot the farm lands,
  Flecked with pumpkin's gorgeous gold;
When wild geese seek the warm lands,
To escape the northern cold;
When the air is clear and bracing,
  With just a hint of frost—
'Tis autumn's finger tracing
  The legend, "Summer's lost."

BUY SEEDS BY NAME

If you were buying apple trees you would rather pay a reasonable price for named varieties, guaranteed true to name by a nurseryman than to buy unnamed trees just because you could get them cheap. Did you ever think of the fact that this same argument applies to seeds? Branded and guaranteed seeds are the safest and in the end the cheapest. There must be quality in every package, for the maker must make good goods or he can't stay in business. When you buy Lilly's Best Seeds, Northern Grown, you buy seeds that are true to name, pure and of high germination. Don't take chances. Send for catalog. **CHAS. H. LILLY CO., SEATTLE,** for over a decade the leading Seedsmen of the Northwest. No matter where you buy, ask and insist on Lilly's Seeds, and if your dealer does not sell them write to us and we will supply you. Lilly's "Crop" Book is of great interest to farmers. Free

Grower of Strawberry Plants only, and only the best.

The Ornamental Garden

PRUNING ROSES.

The National Rose Society, of England, includes in its membership the leading rosariahs, not only of Great Britain but also fo the world at large.

The growth of the Society in recent years has been almost phenomenal, indicating thereby the rapidly growing interest in the cultivation of the queen of flowers. As late as 1900 the membership was only about six hundred, while at this writing some four thousand rosarians, professionals and amateurs, are recorded in its archives.

From its handbook we quote how to prune roses:

"The following general directions and explanations should be carefully read before proceeding to carry out the instructions afterwards given, or the reader may fail to grasp the meaning they are intended to convey.

"The late Rev. A. Foster-Melliar in his 'Book of the Rose,' pointed out that the necessity for pruning arises in a great measure from the natural growth of the rose. 'By watching,' he said, 'an unpruned rose tree, either wild or cultivated, it will be found that the first strong shoot flowers well the second season, but gets weaker at the extremity in a year or two, and another strong shoot starts considerably lower down, or even from the very base of the plant, and thus soon absorbs the majority of the sap, and will eventually starve the original shoot and be itself thus starved in succession by another. A rose in a natural state has thus every year some branches which are becoming weakened by the fresh young shoots growing out below them. This is one of the principal reasons why pruning is necessary. A rose is not a tree to grow onwards and upwards, but a plant which in the natural course every year or two forms fresh channels for the major portion of the sap, and thus causes the branches and twigs above the new shoots to diminish in vitality.

Two Distinct Operations.

"This being the case, in order to maintain the strength of the plant and to keep it in the shape required, the wornout shoots must each year be cut away, and the remainder left almost their entire length as in the case of climbers; or shortened back to a greater or less extent as the nature of the variety or the object for which the plant is grown may require.

"Pruning, therefore, is the art of improving the productive power and the appearance of the plant. It consists of two distinct operations. (1)—The removal of dead, weak, overcrowded, or otherwise useless shoots. Unripe wood which in the spring will usually be found to have discolored pith caused by the winter frosts should be cut clean away at the base of the shoots. (2)—Pruning proper, the shortening of those shoots which are allowed to remain after the thinning out process has been completed.

"The most frequent errors made in prunning are (1) leaving too many shoots when thinning out; (2) pruning severely the shoots of varieties which require little, if any, shortening; (3) pruning lightly the varieties which require severe pruning; (4) leaving rose plants crowded with shoots and cutting these to a uniform length all over the plant in a similar way that a hedge is clipped.

"In thinning out a shoot it should be either cut clean away to the base of the plant, or to its starting point on the older shoots from which it springs, as the case may be. When the plant has been pruned the shoots should be left as nearly as possible equidistant from each other, and regularly arranged round it so that it represents a well-balanced appearance on all sides.

"When pruning a shoot it should always be cut to a dormant leaf bud, or 'eye,' as it is called, pointing outwards. In order to keep the plants in a healthy and vigorous condition, some of the shoots which are more than two years old should each year be removed to make room for younger and more vigorous growths.

"Roses require to be somewhat differently pruned according to the purpose for which they are grown. For instance, shoots must be cut back severely if the plant be required for the production of exhibition roses, but if for ordinary garden decoration the shoots must be left longer; if to form bushes they must be left still longer, and if to clothe pillars, arches, etc., some of the shoots will scarcely require shortening at all.

"To cut down rose plants in order to obtain exhibition blooms may seem to the beginner likely to endanger the life of the plants, whereas in practice the harder the shoots are cut in the spring the stronger will be the new growths made during the summer.

"When pruning a rose for the decoration of the garden it should be borne in mind that it is a decorative garden plant, whether it be the large bush or pillar to stand alone, or the dwarfed kind to be massed with others in a bed. As a large range of kinds is available for decorative purposes, it is necessary in pruning, as will be seen by the instructions which follow, to take into account their individual habits and requirements.

"A large and strong-growing rose usually requires some two or three years after planting to reach its full size, and, it is therefore during those first years that the plant has to be built up, and its framework, as it were, formed.

"All roses the first time after planting should be pruned severely, that is to say, they should be cut down to within three or four incnes of the ground. Even in the case of strong growing climbing varieties only the strongest shoot should be left more than one foot in length.

"Roses planted in the autumn should be pruned in the following spring, and if plahted in the spring should be pruned at the time of planting.

"After the first year they should be pruned in accordance with the instructions which follow:

For Ordinary Cultivation.

"In pruning roses for ordinary cultivation or for the decoration of the garden the following rules may be laid down, which apply to all:

"All dead and unripe shoots must be cut clean away to the base whence they started.

"In shortening the shoots, always cut to an 'eye' pointing away from the center of the plant.

"Summer-flowering roses (those which bloom only once in the season), generally need thinning and training rather than hard cutting, and last year shoots should be left long, two-year-old shoots rather shorter, and the three-year-old shoots shorter still.

"The same thing will also apply to a great extent to perpetual flowering roses, but in their case too hard pruning will not destroy, but only defer the season's bloom.

"Climbing roses should have some of the older shoots cut away entirely each year, directly after the plants have flowered in the summer, and the young shoots lightly tied in to take their place.

Nowadays we have no China asters such as our grandmothers grew, but the varieties developed from that modest old strain by our wonder-working florists cannot be left out of any garden without depriving it of one of the most satisfactory of all plants. Nothing is easier to grow and nothing blooms more profusely, nor is richer in color; and few plants have its merit of blooming late in the season. Some of the new varieties resemble the popular chrysanthemum so much in size and shape and color that they are often sold for that flower in the fall. For cutting, the best variety is the branching, with flower-stalks a foot and a half in length.

Garden and Field Crops

THE CELERY LEAF-TYER.

By H. J. Quayle, Whittier Laboratory.

The celery leaf-tyer (Phlyctaenia ferrugalis, Hubn) is a small worm that has been known to occur in the celery fields of Orange county for several years, but not until last year did it appear in such great numbers and do serious damage to the crop. It feeds upon the foliage and also has the habit of spinning a large amount of silk with which the leaves are entangled and matted together. This actual devouring of the foliage and the matting of the leaves prevent the plant from growing normally; but the most serious injury is due to the gouging of the worms in the stalks themselves, often down completely to the base. Stalks so injured are thrown out and where the infestation is severe the direct loss to the product is very heavy.

Distribution.

This insect extends over a wide range of country covering practically the whole of the United States. But in a climate less balmy than that of California it is confined largely to green houses; and in the eastern and northern states it is known as the "green-house leaf-tyer" where it is a pest on various ornamental plants.

Life History.

The eggs are deposited singly or in small masses on the under side of the foliage. They are scale shaped and grayish white in color. About 12 days on an average are required for hatching.

The young larva begins feeding on the under surface of the leaves and in the course of a few days begins to spin a silken web by means of which it fastens together parts of a leaf or two or more leaves if they happen to be in close proximity. In this way it continues to feed and grow, but often, sooner or later, it works its way deep down into the stalk where its most serious injury is done.

When ready to change to the pupa it spins an irregular cocoon of silk at the edge of the leaf or it may roll up two or more, making use of the surface of the leaf for protection. The full grown larva is green or greenish yellow in color and measures about three-fourths of an inch long. The length of life as a worm or larva is about three weeks. The pupal or chrysalis stage lasts from 8 to 12 days. Counting the egg stage at 10 to 12 days the total cycle from egg to moth will be from 40 to 45 days.

There are two other worms commonly found with the leaf-tyer, the colony looper and the silver caterpillar, but these are both very much larger and should not be mistaken for the smaller leaf-tyer.

The adult of this worm of the celery is a moth which is pale reddish brown in color and measures with the wings expanded about three-fourths of an inch. These are usually not seen during the day unless they are disturbed from their resting place which is generally on the lower surface of the leaves or well down toward the base of the stalk. They are active just before sundown and it is at that time that the eggs are deposited.

Control Measures.

Mr. S. S. Rogers, of this laboratory, in connection with his work on the celery blight last year, tried various kinds of sprays for this insect and found that an arsenical poison gave most promise of keeping the worms in check. This should be applied early in the season upon the very first appearance of the worms. Not only are the worms themselves easier killed at this time, but on account of the small size of the plants, the spray can be applied murch more effectively.

Paris green in the proportion of 1 to 1 1-3 pounds to 200 gallons of water is the most practical poison to use. This is preferable to the other standard arsenate, namely, arsenate of lead, for the following reasons: First, we have shown that there is no injury to the plant through the use of Paris green, and it is for this reason, very largely, that arsenate of lead has superseded Paris green in apple spraying work. Second, it is cheaper and is a more active poison. Third, it is not retained on the plant so long as the arsenate of lead. Fourth, it can be combined with the Bordeaux mixture for the blight without affecting the character of either spray.

It is important to force this spray thoroughly into the crown of the plant by strong downward pressure. Because of the insolubility of Paris green it should be kept in mind that almost constant or very frequent agitation is necessary to keep it in suspension in the water.

The worms appeared this year about the middle of August so that the first spraying should have been applied then. There is of course considerable variation in the time of planting the different fields, and the spray can be longer postponed in the later plantings. A second spraying for the worms should be applied at the time of the first spraying for the blight and here the Paris green and poison can be combined. If a third spraying seems necessary the poison can again be combined with a later spraying for the blight.

If the Paris green is applied while the plants are still small, or partly grown, there is no occasion for alarm through possible poisoning from eating the celery. It has been determined, in the case of other plants, that enormous quantities would have to be consumed at one time to have any ill effect. Apples are almost universally sprayed the last time when they are practically mature, and with arsenate of lead which adheres more tenaciously than Paris green. Cabbage is also sprayed with Paris green up to the time the heads are half formed. Besides, celery is always washed before placing on the table and this would remove what little poison might still be remaining. However, if the spraying is delayed until the plants are nearly mature it should be done with the proper precaution, or else a contact insecticide, such as kerosene emulsion, substituted.

When, Where and How to Trap

OUR new illustrated Trappers' Guide—yours free for the asking—is the biggest and most reliable guide published. Reveals valuable trapping secrets and the carefully guarded methods of successful trappers. What we tell you on Animal Baits is as important to any trapper as traps. Full directions on preparing skins for shipment and how to get the most money for them. This book will increase the catch of experienced trappers as well bring success to the inexperienced. The Game Laws of all the States and Canada are given in concise, unmistakable form, with the information you want shown at a glance. We will send you this book free if you write us before all the books are gone.

QUERIES AND REPLIES.—Renovating a Walnut Grove; Soft Shelled Duck Eggs; Milking the Heifer; Possibly Thrips; Dairy Question; Symptoms of Cold; Hog Tankage; Paraffining Orange Blossoms; Measuring Water; Wood Ashes; Thrips; Protection Against Frost; Centrifugal Pump; Soil Maintenance; Cover Crops; Red Spider Again; Government Lands; Destroying Stumps: 377, 378.

HOUSEHOLD—Fully Identified; Take Care of Your Eyes; The Quarrel; Pickle Recipes: 380, 381.

PRODUCE MARKET.—Los Angeles Market, San Francisco Market; Deciduous Market, Citrus Market: 382, 383.

Painstaking Work

Probably the boosters who boost hardest for fairs, carnivals, expositions and other similar functions are those interested in increasing our population, causing greater demand for real estate and generally advertising the community or state. There is nothing necessarily to be condemned in such an aim, but vastly greater benefits may accrue if a more important adjunct of prosperity is encouraged. We have visited many such fairs, agricultural, citrus, grape and apple, and it sometimes appears that many, perhaps more correctly, a few, attend with no eye for improved methods, improved varieties, nor an uplift which will improve quality and reputation and ultimately profits.

We have seen a similar spirit in citrus packing houses where fruit of growers co-operating in packing is brought together. The grower of the very poorest fruit often has an idea—and we believe he is honest in it—that his fruit is the equal of the best. Of course he has a grouch if it isn't so classed, and fails to grasp the idea that improvement may lie in himself. The exhibitor who fails may feel that judges are partial to others or can not appreciate quality. Possibly they can not; more likely they can, and it is reasonably sure, are honest.

In any case the first step on the part of the exhibitor may well be to look within and inquire diligently. The case of judging car lots at the Watsonville Apple Show illustrates. Sixteen exhibits were made; some faced beautifully, beautifully colored fruit, almost a perfect pack, tight pack, etc., but three conscientious judges going to the bottom of three boxes in every car found varying conditions. Indifferent fruit in lower tiers was mercilessly exposed, every wormy or scaly or off-sized or off-colored apple counted and the best car determined with exactness.

The market in which fruit is sold is as merciless as the judges, more so if possible. The poor fruit at the bottom affects the retail purchaser, for some one has to purchase it; this in turn affects the wholesaler and the demand, and the "prize" of a high reputation and keen demand, for the brand is lost.

The packer and producer can learn valuable lessons by following for an hour as good judges as scored the Watsonville Show. There were exhibits by the largest shippers, concerns with world wide reputations as big handlers of fruits, one of which had the lowest scoring car on exhibition, while the silver cup, two gold medals and $250 in gold for the Grand Sweepstakes went to a comparatively unknown packer, a Slavonian.

Why? Painstaking.

Educating Downward

Referring to the conditions existing near the University Farm School, Mr. Geo. W. Pierce of Davis stated in an address before the Farmers' Week audience that in all fairness to the youth coming there to be educated at the state school the conditions which permitted so many saloons near such an educational institution should be changed. The effort was once made to wipe out the deadfalls, but the believers in the saloon won. This paper has nothing to do with the saloon question excepting where it concerns the education of young people of the farm. The young men of the State University at Berkeley, who are much older than those attending the school at Davis, are protected by abolishing the saloons. Likewise at Stanford. Davis must realize that in receiving the University Farm in the community it must assume the role of an educator of the youth of the state, and the most casual observer can only feel that the education given by the present surroundings of the institution is entirely in the wrong direction.

A Great Farmers' Week

Last week proved a most valuable one to those able to attend the University Farm Farmers' Week program. From early Monday morning till Saturday afternoon, including evenings, a continuous feast was spread and the large attendance showed appreciation of this effort of the University people. On Friday evening a diversion and a genuine delight was afforded in a concert by the U. C. Glee Club, but all the rest of the week was filled with solid meat. In fact, so full was the week that much of the time two sessions were held in different rooms.

One feature which proved of exceptional value was the Home Economics demonstration. Miss Clara Palmer, a new instructor on the staff of the State Polytechnic school at San Luis Obispo was in charge of that program.

We refer to the program on this page merely to call attention to the continued success of that which we hope will be a permanent feature of the State Farm work. Another week more particulars will be given.

The Coming Citrus Crops

Southern Pacific and Santa Fe freight traffic officials state that their field agents report that, owing to the increase in the planted acreage and the favorable condition of the groves since the first of this month, California will produce, during the season beginning in November, between 30,000 and 50,000 carloads of oranges, the largest in the history of the industry, and the aggregate gross value of which will be in the neighborhood of $50,000,000.

According to the field agent's report, this large production of oranges, which is also meant to include lemons, will come from the following citrus growing district:

Southern California, 45,200 carloads.

San Joaquin Valley, 4000 carloads.

Oroville district, 800 carloads.

The largest production heretofore was in 1908, when the number of carloads was 41,400. During that season the Oroville district and San Joaquin Valley—better known among the orange men as the Porterville district—shipped 2600 cars. The remainder came from south of the Tehachapi mountains.

The crop in the Porterville and Oroville districts ripens and gets into the market four or five weeks before the Southern California crop. The Porterville residents pride themselves on shipping their first consignment East, the last week in every October. Oroville is a week later. Both districts readily get their product into the Eastern market in time for the Thanksgiving Day trade.

The railroad revenue from the business is generally believed to be one-third of the gross receipts from the business. So if the crop for the new season, beginning in November, is placed at $50,000,000, the railroads will get as their share $16,666,000 in round numbers.

Consul John F. Jewell, of Melbourne, furnishes a copy of the Official Review of the butter trade of Victoria, from which it is shown that the total amount of butter received at Melbourne from the several districts of the state amounted to 46,642,400 pounds during 1909, while the exports for 1909-10 amounted to 36,388,000 pounds, which was the highest figure attained in the history of the export trade.

The early predictions about the size of the lima bean crop, says the Oxnard Courier, are being outdistanced. From every hand comes the word that the crop is greater than was predicted. It is estimated that there have been more than 700,000 bags threshed and that the total crop will run more than 1,000,000 bags.

Citrus Fair at Visalia

A meeting of the Citrus Fair committee was held at the Tulare Board of Trade rooms, October 6, at which it was decided to hold the fair between December 5th and 10th, opening Monday evening of the first mentioned date, and closing on Saturday evening.

It was decided to go before the supervisors at the session next week and make formal request for the usual $1000 donation. The board has tacitly promised this amount.

The matter of the premium lists was discussed and it was decided to rearrange them, increasing the prizes in some cases. The matter of points on which to base awards was also considered. The committee was reorganized with the following composing the membership: V. D. Knupp, W. S. Sprott and A. G. Schulz, Porterville; L. S. White and G. S. Berry, Lindsay; A. B. Young, C. F. Balaam and U. G. Knight, Exeter; W. B. Nichols, F. H. Wilson and Tom Arthur, Dinuba; C. E. Goodale, D. G. Overall and J. E. Pogue, Lemon Cove; J. Sub Johnson, A. Levis and Leon Goldstein, Visalia. Officers were not elected, this being left to the spring meeting.

Estimate of Raisin Output

The Fresno County Chamber of Commerce has appointed a special committee to ascertain as nearly as possible the California raisin crop for this season. There have been many contradictory statements on the part of both bulls and bears and the Chamber of Commerce deems it wise and fair to both producer and consumer to obtain and publish reliable statistics. The committee, through its chairman, George L. Warlow, has sent blanks to all raisin producers requesting information as to acreage, trays, and tons of Muscats, Thompson Seedless and Sultanas for the years 1909 and 1910. An immediate return of the blanks is requested, and a fund of valuable information will doubtless be gathered.

It Rained

October rains do some good; possibly an early October rain does more harm than good. The recent storm found some table grapes on the vines and did some damage. Some unthreshed beans were discolored, and possibly some threshed grain still in the fields was injured and some sugar beets had their sugar content destroyed.

On the other hand, some ground was made ready for plowing for fall seeding, and for the comfort of all of us the dust has been washed from the atmosphere and from the foliage and life seems more livable. Whether the result is good or bad, the rain came, and the lesson is to be prepared another October for its recurrence.

To build up and maintain fertility in the soil, feed a large part of the crops and return the manure to the land. If manure is not available, plow under crops grown for the purpose. Plow deep (but do not subsoil). Grow leguminous crops for the nitrogen they add to the soil.

The output of the Pajaro Valley this year will be upwards of 4000 cars besides much fruit used in the driers, and for cider and vinegar. To produce this the Valley has planted a million trees, and it is claimed that less than half the acreage of that section is in apple orchards. The Valley produces more than the states of Oregon and Washington combined. The gross income will amount this year, it is estimated, to two and a half million dollars. The yield per acre is variously estimated at from $250 to $800.

Agricultural News Notes of the Pacific Coast

Northern California

Shipments of navel oranges from Oroville were expected to begin this week, and from the Porterville district next week. They will be pretty sour, but it is expectd that they will sell.

Data that would cost considerable to obtain is contained in a pamphlet concerning the yield of the eucalyptus plantations in California, which will be issued shortly by State Forester Homans.

Mrs. Godding sold 13 acres of her orange ranch at Lindsay to O. E. Crouch. . The grove consists of five acres of Valencias and 7 acres of Washington Navels, 5 years old. The consideration was $17,500.

A report says that W. C. Brown and company recently shipped a car of Zinfandel grapes to Chicago, receiving a net price of $15.50 on board the cars at Lodi. This is said to be the first time that wine grapes have been shipped East.

The creamery owned by E. F. Hale at Orland, Glenn county, has been sold to H. H. Bennett and other parties in Sacramento, who propose to enlarge and otherwise improve the plant. An ice factory and cold storage plant will be added.

Game Warden George Neal plans to make the state farm at Folsom penitentiary into a game preserve. The farm covers many acres. When assured of protection Neal will release the thirty Hungarian pheasants which he now has for breeding purposes.

The rice of the experimental farm of the Sacramento Valley Irrigation Company at Willows, is ripening well and being harvested as fast as it ripens. The growth is vigorous, with large heads of well-filled grain, all fully matured and of good quality.

T. B. Gibson of Woodland finished harvesting his beet crop last week. Mr. Gibson was one of the few men who harvested a fair crop under the irrigation system. He harvested about 200 acres and the average yield was about thirteen tons to the acre.

L. E. Alling has sold to a syndicate composed of A. N. Davis, E. L. Davis, Edward F. Davis of Linden, and the firm of Grunsky, Dietrich & Liestner of Stockton a tract of land consisting of 466 acres, situated in the Linden section about six miles east of Stockton.

The Tharp Bros. farm near Kirksville, in Sutter county, will produce from $20,000 to $25,000 worth of beans and broom corn this season, if the weather will permit the harvest of the same. There are 200 acres of beans besides a large field of broom corn.

The Sutter Farmer says that the warehouse at the Armsby Preserving Co. cannery is a busy place, as the canned fruit, which has filled the big building during the summer, is now being labeled, boxed and shipped. This has been the biggest run and largest pack made of any previous season.

Driscoll Brothers of Watsonville have leased a fifty-acre tract of land on the California Nursery property, and will establish a strawberry farm. The new firm has had considerable experience in the strawberry business and are satisfied that the land chosen is adapted to the production of this fruit.

There was shipped from Sacramento on October 1 fifty crates of California grapes on their way to Mexico. Each crate is addressed to a high Mexican official, or some personal friends of President Diaz. The grapes are not being sent as an advertisement of the vineyards of California, but by special order of Diaz himself.

Central California

An agricultural society is being organized by the students of the Fresno high school who are taking part in that department.

The Fresno office of the government weather bureau service will issue bulletins each morning and evening until the critical point in the raisin season is passed.

Governor Gillett has appointed Dr. Chester Rowell of Fresno, and Judge Charles W. Slack of San Francisco as regents of the University of California to succeed themselves, term expired.

In the country real estate market one of the most important of recent deals recorded is the purchase of 3000 acres of wheat land in the Crocker-Huffman irrigation district of Merced county.

The old Borden & Freeland ranch of 320 acres, one of the most desirable tracts of land in the vicinity of Madera, has again changed hands, Tyrell Bros. of Porterville having come into possession.

Glanders has again been discovered in the upper Tule country and today in accordance with the orders of the county veterinarians six valuable animals suffering with the disease were shot and the bodies incinerated.

The Sunset Lake Investment and Irrigation Companies contemplate a general scheme of improving and reclaiming lands in the Kings River slough country and have made the arrangements to finance the project.

"California District and County Fair Association" is the name for a new organization formed at Visalia, October 4, for the purpose of securing a passage of a bill by the next legislature to give aid to county and district fairs.

Seventy-nine carloads of apples in one day's shipments from Watsonville is the new record which was made October 3, which brings the total shipments for the season up to 1586 cars as against 824 at this time last year.

October 11 the Watsonville Driving Club gave a parade that was worth looking at. There were thoroughbred horses, the best in the Pajaro Valley, and trotters and pacers from Hollister, Salinas and other nearby towns, in line.

The Fresno county fair was in full swing during the week of October 3. Features of the program were a parade through the business portion of the city, including the fire department, political clubs, labor unions, horse racing, etc. The agricultural and horticultural exhibits were typical of the Fresno district.

Mr. Albert O. Griffes, who lives three miles above the power house on the middle fork of the Kaweah, at an altitude of about 3500 feet, was in Exeter recently, says the Sun, and stated that he had some of the finest orange trees on his place to be seen anywhere, and that the fruit this year is large and plump and the yield good.

Messrs. Marks and Hoffman are the owners of four hundred acres of land near Tipton, which they are now developing by putting down three wells, two of which are twelve inch, while the third will be seven inch for domestic purposes only. The two larger wells will be equipped with 25-horsepower engines and No. 8 pumps.

The new raisin seeder at the Dinuba Farmers' Union Packing house here was started on muscats October 1 for a trial. It is a very good piece of work for a try-out and in a couple of days the machinery will be in shape for constant running. This new seeder will give employment to between two and three dozen extra hands for many weeks.

Southern California

For a cash consideration of $20,000 George W. Thomas of Riverside has purchased an eighty-acre alfalfa ranch near Perris, from E. S. Moffett.

For a consideration of $15,000 F. W. Hetherly of Los Angeles has purchased a tract of 70 acres in the West Riverside district. It is his intention to plant the property to Valencia oranges.

The business men of Beaumont met October 6 and organized a new board of trade. Geo. W. Lee was selected as president, G. F. Van Velzer and Oscar Littchen vice-presidents, and Mr. Ridsdale secretary.

A revised estimate of the loss sustained by the American Olive Company in the destruction of its olive plant in Los Angeles recently places it at $175,000; insurance carried $100,000. The plant is to be rebuilt at once.

As an indication of the rapid extension of the dairy business in the Imperial valley, the Press of El Centro claims that during the past 12 months not less than 2000 cows have been shipped into the valley as based on the report of cow dealers.

Mines & Farish, of Los Angeles, report the sale of 1000 acres of land located four miles southwest of San Jacinto, for a consideration of $60,000. The land was sold to Mrs. A. E. Higgins of Los Angeles, who buys the property for an investment.

The Glendora Water Company will soon have its big reservoir on Palm Drive, just east of the Glidden villa, ready for use. The capacity is one million gallons and the pressure per inch on a level with the business section of town will be forty pounds.

The Riverside Press says that E. W. Hall of the Hall meat market is looking for the owner of a gold ring discovered in the craw of a hen killed at his market. The ring is of solid gold with skull and crossbones emblem, the eyes being of emeralds.

The price of apricots where growers yet hold them, is kiting. A report from Santa Ana states that the minimum price there is 11 cents per pound and the directors of the Orange County Fruit Association are considering holding for 12 cents minimum.

The people of Brawley are making an endeavor to secure a viticultural station for Imperial county, and are now in correspondence with a Federal vine expert in an effort to get assistance in solving local problems in soil conditions, climate and practical culture.

W. G. Leopold, the well-known purveyor of vegetables, has disposed of his Bardsdale ranch to Hess Elkins, a lifelong resident of Fillmore. The ranch is located on the Guiberson road and consists of 53 acres, part of which is in lemons and the balance in garden truck.

At a recent meeting of the Los Angeles Board of Health it was represented that G. W. Barnett, out near Silver Lake, was starving his cows. It was said at the meeting that many of the cows can scarcely walk, and the Society for Prevention of Cruelty to Animals was asked to take the case up at once.

"The Whittier Vegetable Growers' Association is now active at its packing house at Evergreen station. The season, thus far, has been an especially favorable one and if conditions remain so till the close it will likely be a record breaker. The vines never looked better or the tomatoes finer," said Mr. H. M. Jordan, secretary of the association. The season lasts from three and one-half to four months. The association last year controlled about three hundred acres of tomatoes and shipped sixty-eight carloads of the vegetable. This year they have nearly 400 acres and will perhaps ship 75 carloads.

The Coast

In Colorado prairie dogs have been destroyed with bisulphide of carbon gas in a manner similar to the tests in Minnesota on pocket gophers.

More than seventy families are now settled on the farm units of the Yuma Indian Reservation, in Imperial county, and improvements are making rapid progress.

Australia leads the world in sheep farming with 87,000,000 head. Argentina has 7,500,000; Russia, 58,500,000; United States, 54,700,000; United Kingdom, 30,000,000.

The Commercial Club of Elgin has decided to hold the third apple show Nov. 3-5, to be known hereafter as the Eastern Oregon Apple Show, open to exhibits from all eastern Oregon.

It is reported that the Snake River Irrigation company of Boise has been financed and that the contract for a new dam has been let. This work involves the expenditure of $500,000.

A cattle-breeding station has been established in Alaska, to develop the milking qualities of the Galloways, as they are said to be the most hardy and best adapted to the climate of that country.

At a recent meeting the South Texas Citrus Growers Association elected the following officers. E. S. Stockwell, Alvin, president; R. H. Bushway, Algoa, vice-president; J. H. Arbenz, Sarita, secretary-treasurer.

The largest apple of the Jonathan variety ever found in Walla Walla valley was taken by W. S. Offner, the well known fruit man, from his orchard. It grew on a three-year-old tree and weighed one pound and seven ounces.

F. S. Baldwin of Tempe, Ariz., has in his orchard about two acres of Bartlett pears. He says the crop this year is by no means exceptional, only an average, yet from these two acres this year he will harvest not less than twelve tons of pears.

Go way from home to get the news: The Farming World of Maine says tnat a new farming is being developed in California, that of gathering seaweed. Last year $100,000 of this crop was shipped to China as food for oxen, sheep and pigs. Who are the people in this business?

The harvest of the cranberry crop in Coos county, Oregon, is nearly over and the yield this year is big. The average of all of the cranberry marshes in that locality this year will be about 400 bushels an acre. Allowing $1 a bushel for picking and packing this gives the grower a profit of $800 an acre.

The first annual Pacific Northwest livestock show will be held March 20-22, 1911, at the Union Stock Yards, Portland. The officers of the association are: president A. J. Splawn; vice-presidents, James J. Hill, Robt. S. Lovett, Wm. Hanley Burns, Frank J. Hagenbarth; general manager, D. O. Lively; secretary, N. C. Maris.

An experimental shipment of apples to Southampton from the Wenatchee section of the State of Washington, made in 1908, proved so successful in a financial way, that in 1909 the same dealer made another shipment, this one amounting to 20,000 cases. The fruit was neatly packed and went on the market in first-class condition.

The Country Gentleman calls attention to the fact that the increasing scarcity of swine was illustrated at the Oregon State Fair at Salem this year. The exhibitors not only sold all the pure-bred hogs they had with them, but many of them of established reputation sold young boars and spring gilts at home, and there were several instances in which breeders who would not part with their bred sows were asked to put a price on the unborn litters.

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Practical Poultry Culture

BRAIN AND BRAWN.

"Men in Action" is the title of a letter appearing in the October number of the World's Work, in which Rev. Frederick Lyne, owner of Lynehurst ranch, gives some of his experience in establishing a poultry farm near Tucson.

The letter was written two years ago and therein contains the statement that the writer has 2,000 chickens on the ranch. This number has been increased and to-day Lynehurst is the largest poultry farm in the southwest, there being over 4,000 chickens on the ranch.

The letter, as it appears in The World's Work. is as follows:

Here is a tale—not of woe, but of conquest. You have heard from me and from others that I have been working for years on the hen problem. Of course, hen fever is likely to develop in any man, rage for a time, and then die out. In my case the fever was never of the raging sort. My inspiration to work with poultry came from deeper sources. I have been waging a tireless warfare for the financial freedom of the family. No matter how weak in body I have never been infirm in purpose. I know there is no cure for me; that I can never again know what a man really feels like who breathes and fills his lungs. With me the question is simply—how long can I stay here with the family? There is a flame that burns within the breast of some "lungers" that seems to resist the blasts that shriek for its extinguishment.

But I have not been content merely to fight tuberculosis. I could not make a business of invalidism. I would blush to join the ranks of those valetudinarians whose graft is to enjoy poor health; so I resolved that I would show my children a father at work. I could not command success, but I would show my boy how bitterly his grasping daddy fought to teach him by daily example the dignity of labor. I have won my fight after six years of effort.

Now I can imagine what sort of a hen coop you think I have here, but I will tell you about it. Six years ago I began with 24 hens. Year after year I forged ahead until to-day I have 2000 standard-bred White Leghorn hens, and every chick is of my own hatching! Imagine 2000 beautiful white hens in procession on your main residence street!

I repeated the blunder of sending thousands of miles away for eggs when better ones could be had nearer home, but as I was closer to the natural hatching season than when I first experimented, the results were better. This time I hatched White Rocks only. The eggs came from a well-known eastern breeder, and while I was disappointed in the number that hatched I was greatly pleased with the quality of the few that came. All chicken folk will admit that the White Rock is a fine chick. He grows fast and he is a chummy little fellow from his youth up. I believe I took 100 fluffy chicks from that incubator. Previous experience had taught me how to detect deformities in chicks, and I was pleased to see the little rascals standing squarely on their feet and to watch with keen delight their pretty shoe button eyes.

Yes, of course, I was yet very foolish about chicks. For hours I sat and watched them play, and often I would drag the rest of the family from the house to the brooder to see the chicks at football with a piece of meat. While watching them scuffling for the meat, the world seemed young to me and I forgot every unpleasant thing—forgot that anybody, anywhere, was sick. Before me was life, young, hustling, scrapping, tugging, and I was held longer by those little fellows without fatigue than I could have thought possible.

The energy that drove me on was only in a limited sense physical. A quick perception of just what part of the work would break me down helped, and I always managed to have someone with a stronger arm where I knew mine would fail. But the secret of this poultry proposition is found in the cells of the brain, not in the muscles of the arm. Only a little brawn is necessary in the business. I could buy that, but I cannot hire tive to heat or cold that it cantells the hand or face that becomes so sensitive to heat or cold that it can tell in a moment if a little chick is gasping from heat or becoming chilled from cold. I cannot buy "gumption."

I have been above measure obstreperous. I have refused to be "a dead one," and here goes a letter to you, six years after my proper funeral should have been held, which plainly indicates that I have not been even a good living corpse. Six years ago my friends set me in a chair and watched that chair. Yet they often find it empty—lo! I have gone. But later I return. I have been merely off, feeding the chickens.

The really vital thing in the fight against tuberculosis is to keep the malady below the collarbone. The "white plague" is a disease of the lungs—not of the brain. While the enemy's sappers and miners are undercutting and blasting out the lung tissue, a man with a clear head may conquer a kingdom, plant a vineyard, or establish a poultry farm—if he has any "ginger."

PRESERVATION OF MANURE.

Fresh poultry manure has approximately twice the fertilizing value of cattle manure, if a comparison of the two products is based upon their nitrogen content. The nitrogenous compounds contained in poultry manure, however, are very unstable, and decompose readily into ammonia and volatile ammonium compounds. Consequently, unless proper care is taken, large quantities of nitrogen, which might be used for fertilizing, are lost.

Several methods have been suggested for retaining this nitrogen. They consist in mixing with the excrement either an absorbing substance or an acid compound which will chemically combine with the ammonia as fast as it is formed.

Experiments carried on at the Maine Experiment Station showed that poultry manure, untreated, as well as that mixed with sawdust, lost half of its nitrogen in the course of six months. Where the manure was stored with half of its weight of gypsum (land plaster) it lost a third, while that mixed with an equal weight of sawdust retained all of the original nitrogen. Equally good results were obtained by using from one-third to one-fourth of the weight of the manure of either kainite or acid phosphate.

From the standpoint of the mechanical condition, the mixture with land plaster gives the least desirable product, although the addition of sawdust aids materially in preventing the formation of hard cakes.

When the manure is to be kept only a few days before applying, good results may be obtained with dry loam or peat as an absorbent.

The absorbent used should be sprinkled daily, in the required quantity, on the floor of the hen-house; from which, in combination with the excrement, it may be removed when desired.

The difficulties experienced in spreading poultry manure, on account of its sticky consistency, may be obviated by mixing with loam, peat or common stable manure. For economical use, it should be spread in relatively smaller amounts than other manures.

The admixture of lime or wood ashes is not advised, since decomposition is sufficiently rapid without their use.

It should be borne in mind that each of the absorbents suggested is in itself of value as a fertilizer; the least valuable is sawdust. Consequently the requirements of the soil should govern to some extent the choice of the absorbent used.—Rodney M. West, University Farm, St. Paul.

LAY OF THE LAST COCK.

The night was long, the wind was cold,
The rooster was infirm and old,
His battered comb and feathers gray
Seemed to have known a better day.
The last of all the birds was he
That roosted in the leafless tree.
For, well-a-day, his race had fled,
His feathered brethren all were dead,
And he, neglected and oppressed,
Longed to be with them, and at rest.
A monarch he, when in his prime,
But now, at length had come his time.
A worn-out chicken, scorned and poor,
He swayed, then fell to rise no more,
And gave, to please a coyote near,
What once was fit a king to cheer.

POULTRY TALK.

The way one keeps his fowls is generally the way the fowls keep him.

The day of crossing breeds is a thing of the past. We now have utility pure breds.

Work up a strain of hens that will lay. Save the eggs from the best layers, and set them.

The fowls that are small for their age should go now. Their room is of more value than their company.

Hens dread to get into dirty nest boxes. They won't do it if they can help it. Why don't you see to this, right off?

Never change to a new breed simply because extravagant claims are given. It is better to try to improve the old ones.

The professional poultry keeper hardly ever neglects to furnish his fowls grinding material. Many a farmer thinks that his hens can get along without teeth.

The experienced poultryman breeds only from his best winter layers. It is then when prices are at their best, and profits are to be counted upon in the poultry business.

Start the trapnests so that it can be known which are the best winter layers. Almost any old hen will lay in spring and summer; it takes a good hen to lay in late fall and winter.

No draft should be allowed at any season of the year, but more care must be exercised during the fall and winter months. Even a small knothole sometimes works havoc.

The interior of the chicken house should be thoroughly sprayed every square inch with kerosene into a gallon of which two tablespoonsful of carbolic acid should be mixed.

The last egg laid before a hen goes to sitting will often be so small that it will have no yolk at all. There is an old notion that it is bad luck to bring these small eggs in the house.

A good coating of whitewash on the inside of each house will help considerably in getting rid of vermin. Take several inches of dirt out of the houses and replace with new, clean earth.

It is a too common practice to inbreed. Don't do it. It is easier to secure good cockerels now than it will be later in the season. Get them now and you will have them when needed.

Carbolic acid with kerosene or lime or any of the prepared dips for killing lice and mites will aid in the destruction of the pests, and a little of the acid in the fowls' drinking water will ward off disease.

A nest that suits the turkey hen first-rate may be made by turning a salt barrel on the side. Put straw in the hollow, and a nest egg, and cover the barrel over with brush, if you have it handy.

Do not try to winter more hens than you can care for well. It has been proved by repeated experience that a few hens kept well will do much better than a large number poorly housed and fed.

On the first of January, this year, the value of the live stock of the American farmer, exclusive of poultry, reached the stupendous total of $5,139,000,000, a sum equal to the total gold production of the entire world for the past twenty years.

Rake up the litter and rubbish that have accumulated in the runs, and then spade or plow them up. If there are double runs to each house, sow one of them into rye for winter green feeding. Don't delay the sowing of rye much longer.

Don't forget to shut up the breeding ducks at night. This is the only certain way of securing all the eggs from these hap-hazard fowls that lay anywhere and everywhere. If they are given their liberty before eight or nine o'clock in the morning, some of them will be very apt to lay in the water or under the barn.—Farm Journal.

Do not allow the pullets to roost in the coops where they were raised. The cooler the weather gets the worse they will crowd. They will suffer from the heat, and when let out these cool mornings are apt to take cold, and roup is the next thing on the programme. The pullets expected to lay this month should be roosting in a comfortable house at this time.—Farm Journal.

Warm conditions favor quick moulting, and the house in which the moulting hens roost much be warmer than at other seasons of the year. Make the house just as warm as possible during this stage, but provide good ventilation. Above all things, keep the hens dry when they are partly bare of feathers. With a full coat of feathers, a hen can stand a heavy rain without inconvenience, as the feathers on her body are so arranged as to readily shed water. But with only a few feathers, she is quickly wet and chilled by even a small shower, and a hen wet to the hide will soon become a sick hen, at this stage in no condition to meet the shock. While the new coat of feathers is growing the hen needs all the possible warmth and nutrition to keep up her bodily heat and to keep the animal system in good working order.

GOOD BIRDS WIN.

At the late San Jose show in competition with Buff Orpingtons imported direct from England, Mr. and Mrs. W. E. Sullivan of Agnew, Cal., won 1, 2, and 3, on pen; 2, and 3 on cock; 1, and 3, on hen; and 3 on pullet. Four Club specials from the Nat. S. C. B. O. Club, Am. Orp. Club; two Club Specials from California Orpington Club, and Special Trophy for best pen bred and owned in Santa Clara county, and also Silver Cup for best display of Buff Orpingtons in the show. The "Mercury" reports the opinion of one of the foremost breeders of this breed, as follows: "This is a show of quality; to win a prize here means that one must have the goods." The Sullivans have bred Buff Orpingtons for ten years and in the opinion of Mr. Venn, who handled the show, "they have as good fowls in this variety as can be produced anywhere."

LAYING EGGS ON A SUNDAY.

Consistency is a jewel. One Sunday morning a minister's wife saw her son chasing the hens with a stick. She went to the door to investigate and heard him say: "I'll teach you to lay eggs in a minister's family on Sunday morning!"—Young's Magazine.

The theory that a nurse crop will prevent the weeds choking the alfalfa is apparently, as a rule, not well founded. In the first place alfalfa should not be sown on foul land, and in the second place proper disking and harrowing, at near intervals for four or six weeks before sowing, will disturb or kill far more weeds than cen any nurse crop. Besides, the oats or barley sown as a nurse will, when cut, leave weeds in good growth, or dormant and ready to spring up as fast or faster than the alfalfa. No nurse crop is ever used with fall sowing. When ground has been thoroughly prepared for the preceding crop, and then properly cared for, and made ready for alfalfa by the preliminary weed destruction, it will be found advisable to sow alfalfa alone, even in the spring.—From Coburn's "The Book of Alfalfa."

EGG MAKER

I Have Ten Hens and Get Ten Eggs Each Day

by feeding "Lee's Egg Maker." Without waiting another day, go out and count your hens—count them carefully. For a week keep an accurate daily record of the eggs you get. The guarantee below means *you*.

WE GUARANTEE

that no matter what you are feeding, and regardless of the number of eggs you are getting at the present time, if **Lee's Egg Maker is added** to the daily ration — [illegible] — the increased egg yield [illegible] than pay the cost of the Egg Maker, cost of labor required, and **100 per cent profit** on said labor.

We don't care what your hens are doing *now*, we ask you to buy Lee's Egg Maker on our *guaranty* of an *increased* egg-production at a *reduced* feeding cost. Could we make you a better proposition?

The amount of good *digestible* protein is what counts for results in poultry feeding, and America's big feeders say Lee's Egg Maker contains more *digestible* protein than any other poultry food they can buy.

Lee's Egg Maker is almost entirely a meat food and with an actual tested protein feeding value in *excess* of *80* per cent, and you'll find in it the essentials entirely lacking in other prepared poultry food. The best feeding authorities in the country endorse it—and *use it*. *You* can't afford *not* to feed it, whether you have 10 hens or 1000, the proportionate profit would be the same.

Price: 2½ lb. pkg., 25 cts., 25 lb. pail, $2.00. Ask your dealer or send direct to us. We pay freight in 100 lb. lots.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

Poultrymen, Attention

We want to tell you what we are doing. We are erecting at the present time Yards and Pens for the largest and most up-to-date plant for fancy poultry in Southern California. We can carry on hand with our new yard about 3000 birds. We sell every standard variety, of Pullet, Cockerel, Laying Hens and Cock. We have them on hand EVERY DAY OF EVERY WEEK OF EVERY YEAR. We have been in the Hatching business for 12 years in the west. The Pioneer Hatchery has been established for several years, and from a small start is now the largest baby CHICK DEALERS IN THE ENTIRE WORLD. No order of any kind in the Poultry Line is too large for us. If you want to sell 100 or 1000 hens or more we will be glad to bid on them for spot cash.

We are shipping at present about 7500 baby chicks per week, of the Reds, Minorcas, Leghorns (White and Brown), Barred Rocks, Buff Orps., etc. Whatever you need in our line we will be glad to make a price on. If we can't sell you better poultry for less money, don't buy from us. INVESTIGATION is all WE ASK.

AGRICULTURE

WHY FARMERS SHOULD ORGANIZE.

Farmers should organize because their interests are so nearly identical.

Farmers have interests which should be protected; this can best be done in an organized way.

Organization presents the best methods of business dealing; the farmers should have the best.

Organization not only demands attention, but commands it as well.

Organization of capital and labor has made it impossible for the farmers to obtain greatest results in an unorganized way.

Organization demands organized competition.

Organization is necessary to progress, so, farmers, have a progressive organization.

Agricultural industry furnishes the majority of the nation's wealth and is the basis of all wealth, why then should not agriculture be the best protected of all industries? Organization insures protection.

Organization of interest insures respect, influence, recognition and power, the farmer needs these things that he may be able to receive a square deal.

By organization in a compact conservative body the farmers can secure wise and equitable legislation, and be assured that the interests of agriculture are fairly represented where lawmakers meet.

The farmers in every community should have a permanent economic organization which recognizes the rights of all men and insures to them justice, and to the wife equal influence and dignity, and where all may meet in advancing of a common cause.

To the American farmer no organization can be more highly recommended than the Grange, because it furnishes the social, educational, fraternal, co-operative and legislative features so essentially necessary in completing a well balanced farmers' organization in whose meetings all can find something worthy of their effort.—The Grange.

AVERAGE RATE OF SEED PER ACRE.

Alfalfa, 30 pounds; Barley (in drills), 1½ bushels, (broadcast), 2 bushels; Beets, 9 pounds; Blue Grass, 12 pounds; Burr Clover, 10 pounds; Cabbage (outside), 12 ounces, (in fromes), 4 ounces; Celery, 8 ounces; Japan Clover, 25 pounds; Lettuce, 3 pounds; Mustard, 1 peck; Onions, 7 pounds; Oats (in drills), 1½ bushels, (broadcast, 2 bushels; Rape, 3 pounds; Rye (in drills), 1½ bushels, (broadcast), 2 bushels; Rye Grass (Italian), 50 pounds; Wheat (in drills), 1 bushel, (broadcast), 1½ bushels; Turnips (in drills), 3 pounds, (broadcast), 5 pounds; Vetch, 30 pounds.

ROUND BALES OF HAY.

The other day I saw for the first time a hay-baler that turned off round bales and I naturally became stuck on it at once. It is easy to see that the cylindrical bale is easily handled, fits in more compact space than the oblong bale and by reason of a hole through the length of it the hay continues to cure even after it has been packed. It is tied with twine instead of wire, which makes the bale easy to open and avoids the danger of small bits of wire geting into the throats of stock and strangling them. Baling directly from the windrow without stacking, this machine puts up 40 tons a day with only six men at a cost of $80. This is quite a saving over the old-style machines.—A. Homan, in Field and Farm.

A billion dollars for this year's cotton crop of the United States is figured out by statisticians, whose estimate is made on a 12,000,000 bale basis and the price at last year's average—$73.41 per bale. This includes about $125,000,000 for the seed.

VETERINARY

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Skin Trouble.

I have a valuable mare that has skin trouble which some have pronounced mange. I have been using some simple remedies, but have failed to benefit her. She is continually biting or scratching; bites the hair off.—M. C. W., Beaumont, Cal.

Mange in horses runs a very rapid course. In two to three weeks the hair all falls out. The trouble spreads from one to another and they are crazy with the itching. Your mare is more likely troubled with eczema. A solution of formaldehyde and water, two ounces to the gallon, well rubbed in with a brush once a day, will probably stop it.—R. T. W.

Quarter Crack.

My driving horse has a quarter crack which I can not cure. The horseshoer burns it and it grows part way down and then cracks open again. Is there any way to make it grow down and not break open again? —J. C. W., Hemet.

The horse has a weak, thin wall which must be protected. Have the wall on each side of the crack for one-half inch thinned down nearly to the blood, but do not cut clear through. At the top crosswise of the crack burn a groove clear through the horn. Fill the crack with tar and cover with adhesive tape. Shoe with rubber pads. The rubber pad will protect the hoof and prevent another crack.—R. T. W.

Lame Horse.

Please give me information about my horse that is lame on the front leg, I think from a splint. He gets very lame after being driven a few miles but gets over it if he stands in the stable a few days.—X. Y. Z., Riverside.

There are different ways of treating splints. The best is by cutting through the skin at the bottom of the splint with a knife made for the purpose, with a very narrow blade. Run it up under the skin flatwise, then turn the edge inward and cut into the splint. Make several cuts into the splint but only one hole through the skin. Another treatment is with a sharp pointed firing iron to burn six or eight little holes deep into the splint, then blister with Gombault's Caustic Balsaam.—R. T. W.

HOMESTEAD ENTRIES IN CANADA

Consul Harry A. Conant, Windsor, Ontario: Homestead entries in Canada for the six months ending July 31, 1910, show an increase of 11,852 over the similar period of 1909, the entries numbering 33,416. For July alone there were 4,260 entries, of which 1,248 were made by Canadians residing in Canada, 58 by Canadians returning from the United States, 959 by United States citizens, and with the exception of 34 entries the whole of the remainder were made by persons from the British Isles and northern European countries, in which the government is carrying on immigration work. Of the entries from the United States, over one-half were made by people coming from North Dakota and Minnesota. Patents were issued in July, 1910, for 248,223 acres of land, as against 186,013 for the corresponding month of 1909.

The acreage under cultivation for principal crops in Australia for the year 1908-9 bore favorable comparison with the previous crop year, the acreage last year being 9,892,393 acres as against 9,355,092 the previous year.

John L. Jacquot of Appleton, Wis., has made what is thought to be the biggest cheese ever made. The cheese weighs 4000 pounds and is made for exhibition at the National Dairy Show in Chicago.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Renovating a Walnut Grove.

I have acquired a walnut ranch of some acres which is in a very poor condition. What would you advise me to do to it, to insure a good crop of nuts for next year? The trees are 15 or 16 years old, some are larger where the soil is rich, others are small where the soil is poor. How much barnyard manure would you advise me to give to each tree? Also what kind of fertilizer and how much of it would you advise to be given to each tree?—A Young Rancher, Pomona.

Under the most favorable conditions it will require some years to bring a neglected orchard back to a profitable growth. In this case we would advise putting in a crop of vetches for turning under as a green manure just before the blooms burst. As supplemental, commercial superphosphate at the rate of 500 pounds to the acre can be commended. Nitrogen cultures will also be beneficial applied to the seed before planting, cultural directions for which usually accompany it from the seed stores.

Soft-Shelled Duck Eggs.

Could you tell me what is the trouble with hens or ducks when they lay soft shelled eggs? I have lime, oyster shell, sand, charcoal and ashes be-before them at all times.—A Subscriber, Mentone, Cal.

Soft-shelled eggs are due to a want of lime in the food, or to the birds being overfat, or to the birds inability to retain the egg until fully developed. About the only remedial measures are a reduction of food and exercise calculated to strengthen the bird.

Milking the Heifer.

Will you please advise me as to the milking of a heifer till calving time? My heifer is kept on green pasturage with alfalfa hay morning and night. Recently her milking has fallen off rapidly from two quarts to about a pint at a milking. She should come in fresh in three or four months. Some local authorities advise milking a heifer right up till she calves, as having a great influence on her subsequent milking capacity. Kindly advise me through your columns on this point, also whether the above mentioned feeding is ample for a cow out of doors, day and night, in the San Joaquin Valley.—Fred'k. F. Brush.

Milk her to within six weeks of calving time and then dry her off. The fact that she has dropped in her milk shows she is not one of the class that will not dry off. It is better to have a cow dry for six weeks but some will not go dry without injury to themselves. As to the feed if the heifer is fat and in good order she is getting enough, if she is thin then give her a little grain, a quart a day of mixed rolled barley and bran, cutting down the bran as fast as the cow will let you. They eat the bran best but it is not needed when alfalfa is fed.—M. E. S.

Possibly Thrips.

I enclose lemon twig showing badly curled leaves. What is the cause and remedy?—Subscriber, Lakeside.

The lemon leaves show a curling slightly similar to the curl leaf of the peach; also show some black scale. Of course, the latter had nothing whatever to do with the curling. The leaves have been shown to several and there is declared to be no fungous trouble present, though the scabby appearance of some of the leaves might at first lead to that impression. The curling is probably due to the work of thrips.

Dairy Question.

I have been told by several persons that if a cow is spayed while fresh, she would give a good flow of milk for many years continuously. If this is true when is the best time to spay?—E. L. D., Pomona.

Spaying is hardly to be advised where only a single animal is operated on. The lack of skillful operator and the cost would make either a bar to the work. It is a delicate operation and if poorly performed the cow dies. If successful the cow does not continue in milk any longer than an ordinary farrow cow. The cost of operation and the loss of milk at the time would offset any annoyance in having the cow come around in the ordinary way. I doubt if the butcher would pay more for the beef than if the cow was simply sold when dry.

Symptoms of a Cold.

I have a turkey whose face is swollen just back of the beak and under the eye. The swelling isn't hard, only seems like a puff. We put salve on it every morning but the swelling don't seem to go down, neither does it get worse. She has a good appetite and I feed her a mash of equal parts of alfalfa meal, bran, and shorts, half as much dry beef scraps. She eats about a quart a day.—Mrs. M. D., Santa Rosa.

The symptoms you describe often result from a cold, just as cold sores do with us poor humans. See last week's Cultivator for remedial suggestions under the head of "Danger Signs" in our poultry department.

Hog Tankage.

How can I convert dead carcasses, bones and butcher refuse into tankage for my hogs? There is considerable butchering done in this locality during the winter season and last winter 25 or 30 head of cattle died of bad weather and close range. It may not happen again this winter, but if it should I would like to do something of that kind with the carcasses. I live in the mountains some distance from the railroads and as I am raising a good many hogs cannot afford to haul the amount of tankage they should have and have gotten along without it so far.—Frank C. O'Kelly, Vineyard, Cal.

The proper preparation of animal foods for hog tankage is not without its difficulties on the ranch. as it requires cooking and grinding appliances. Usually, the carcass is cooked or steamed for several hours in pressure tanks, which is said to destroy disease germs, its grease is drawn off and the greater part of the moisture drawn off or evaporated. After being dried it is ground—in that state somewhat resembling dark wheat shorts. It might be feasible to sun-dry the product after cooking. Then some means for crushing or grinding must be provided. It should be used in comparatively small amount, not over 4 to 16 ounces to an animal each day. It may be given dry or mixed with other feeds.

Paraffining Orange Blossoms.

We are subscribers to The Cultivator and get much useful information from its pages. I noticed the question of M. F., of Pomona, as to how to preserve flowers with paraffine. Melt the paraffine and keep it quite warm. Use sufficient so that the bunch of blossoms will all be covered. As you hold the stem between the fingers, dip the blossom down quickly in the paraffine, then shake so that no drops will hang to the petals. Cool by blowing on the blossom and shaking a little until the wax seems to have cooled. If it gets too cool it shows on the blossoms. Dip one at a time. I have preserved perfectly calla lilies, roses, forget-me-nots and many other flowers in this way. I hope this will help.—M. F., Oakland.

Pure
Alfalfa Seed

Good crops cannot be grown from weak or foul seed. Many fine stands of alfalfa have been ruined by the love vine and dodder that was not removed before sowing.

We have installed an alfalfa seed-cleaning machine that insures absolutely pure seed, and our stock is selected from only strong and healthy fields.

Germain seeds are not always cheapest in price, but you will surely get a dollar's worth for a dollar and be certain of the quality.

Malthoid Roofing

Is much cheaper than shingles—
better than iron—
more durable than tin
superior in every way—
to all other brands of roofing.

Why?

Because it is the original roofing made in the best equipped factory in the world—made by men who have been making and studying roofing for twenty-six years.

Malthoid is made to give satisfaction—and does, no matter where it is used.

It's free

Send for it. A new and valuable book on the "Care of Roofing."

No matter what your experience has been or what roofing you have used, this book will enable you to take better care of it. Sent free.

Measuring Water.

I wish to ask regarding measurement of water over the Cippoletti weir. "A" contends that water should be measured over edge of weir opening; "B" that the measurement must be made on a stake set two feet back from the opening, top of said stake being on a level with the edge of weir. What is a legal miner's inch in California?—Subscriber, Orange.

"A" is wrong. The contraction of the water as it pours over the weir would tend to give a much geater quantity if measured at that point. See Cultivator of March 31, 1910, for particular instructions in building weir. Under the Cippoletti table, instructions are to place the measuring peg back from the weir in still water, far enough so that there is no contraction as the water draws down where it starts over the weir; two feet is probably sufficient. It must also be remembered that a "stiller" above prevents approaching current affecting the flow.

A miner's inch in California is usually considered to be sufficient water to fill an opening one inch square and raise the head four inches above the center of the aperture. We believe, however, that the legal miner's inch is under a six-inch pressure.

Wood Ashes.

What is the effect of wood ashes mixed with soil around young fruit trees? Soil is light.—Subscriber, Anaheim.

Beneficial, though, of course, they could be used in excess so as to cause injury, but notwithstanding the fact that California soils are well supplied with potash, the addition of small quantities usually gives porof of the advantages of its use.

Potecting Against Frost.

What is the best method of protecting young orange trees against frost? The trees were set out in '09 so that this will be their second winter. I am advised by some to cover the entire tree excepting the north side. Others say to cover the trunk with burlap or paper.—Inquirer, Reedley.

We assume these trees are planted in orchard form so that they could not be protected by the lath-house method followed in nurseries. The more common plan in citrus sections is to stand cornstalks around the trunks, the tops of the stalks reaching up into the tops of the trees. This protects not only the trunks but many of the branches. Of course care must be taken not to enclose the leaves too tightly or the tree might be smothered. While the projecting branches may be injured by frost, yet they will give enough breathing space so that the tree will get through the winter in good shape. A good supply of newspapers wrapped about the trunk will answer, though not nearly so well. The trouble is that they lie too close and do not admit enough warm air about the trunk. This is much more work but little more satisfactory. Care should be taken to cut string holding the corn stalks in place before spring growth begins.

Thrips.

Thrips are curling the leaves of my orange trees. Can you suggest a spray which will destroy them?—R. B., Visalia.

This query being from Tulare county, and knowing that Commissioner Schulz of that county has wide experience in the treatment of thrips, it was referred to him. He writes:

"I will say that the only method so far used in this section is to spray with the following: One gallon blackleaf tobacco extract and two gallons of lime and sulphur to 150 gallons of water, and the best results are obtained when sprayed on with a pressure of about 180 pounds. This, if thoroughly done, will bring results, but no half-way work will do, and it should be applied several times, at an interval of about ten days. The curling of the leaves as stated by your correspondent is a characteristic mark of the work of thrips."

Centrifugal Pump.

In reply to the query of L. G. H., San Diego, in the issue of September 29th, will say that the Lane & Bowler Company, 2116 Violet street, Los Angeles, claims to have a centrifugal pump which requires no pit.—Subscriber, Covina.

Soil Maintenance.

I think of sowing some kind of leguminous crop in my peach orchard. The soil is deep and fertile, similar to that on the state farm. Are such crops likely to be of value? If so, what would be best to sow, vetch, Melilotus clover or Canadian field peas? Would mineral fertilizers be of any value? The soil is good and the trees seem healthy and I want to keep them so.—J. J. R., Winters.

If we were planting a crop for geen manuring, our first choice would be vetch, closely followed by Canadian peas. It is desirable to get such a crop in early, so that it will attain sufficient growth to be plowed under before the winter rains fully cease. Green manuring can be commended both for fertility and the physical action it has on the soil. Mineral fertilizers should be used with discretion, and only after one thoroughly understands the character of the ground to be treated.

Cover Crops.

Touching upon the decadence of orange groves which is already beginning to show in some sections, I wish to say that it is no wonder when the care that is being given them is considered. I remember that last year you invited some fruit growers to give their methods and experience with green manure crops, also with cultivation, and there was only one out of the whole lot that was anywhere near right and he was only quarter right. However, as he was on the right track, I wish to call attention to his methods. I believe his name was Gerald Geraldson, and that he lived in Newcastle, Placer county. I do not note that the experiment stations or the agricultural college professors have taken any notice of his methods. They seem to be a radical change, but I feel they are well worth trying. We treat our trees in a very artificial way, very much as we do our stomachs. Mr. Geraldson's methods appear to me as coming back nearer to nature and consequently will restore fertility at a minimum of expense.—Paul Thomsen, Aquanga, Riverside county

Red Spider Again.

I am enclosing some clematis leaves which show a disease that attacks the vine every summer. Can you tell me what to do for it?—L. H., Esparto.

This inquiry was forwarded to Dr. J. Eliot Coit of the Southern California Pathological Laboratory and he writes: "As far as I can see, the chief trouble is red spider, and I would recommend dusting with sulphur in the early morning when the vines are wet with dew."

Government Land.

I have land in Harney, Oregon, near the Nevada line. Can any of your readers inform me as to conditions in that section?—Subscriber, Santa Ana.

This we will pass to our subscribers as we have no knowledge whatever of that section.

Destroying Stumps.

Will saltpeter kill an apple tree if it is placed in hole bored into the heart of the tree? I want to destroy 300 trees.—F. E. B., Cave Gulch, Santa Cruz county.

If the inquirer refers to boring holes into the heartwood of the live, standing tree, we think this would not kill it, but will be pleased to hear from our subscibers on this point. When the tree has been cut and a vertical hole bored into the stump and filled with saltpeter, it has been claimed that it burns much more readily after a few months. Others have denied this and claimed that use of kerosene is to be preferred.

Business Notes

DEBTS ARE DEBTS.

The Supreme Court of Michigan, in an opinion delivered September 28th, held that International Harvester Company of America is not debarred from collecting its outstanding debts by any plea that it is a "trust." The circuit judge decided the other way, but his decision was reversed; and the defendants will be compelled to settle their accounts with the company. The facts in the case are that the International Harvester Company of America, several months ago, began action against some dealers to collect a balance long overdue. There was no equitable defense against the debt, but the defendants hit upon the novel plan of setting up the claim that the company was a "trust," and that this was a bar to the collection of the amount due. Strange to say—a lower court sustained this claim, but on appeal the Supreme Court reversed the decision and ruled that the plea that a plaintiff is a "trust" is not a good defense.

THE CEMENT AGE.

We are passing out of the iron into the cement age. In the decade 1870-79 there were produced in this country 21,885,266 tons of pig iron and 22,000,000 barrels of cement. In the decade 1900-09 the production of pig iron reached 197,807,609 tons and that of cement 384,000,000 barrels. At that rate of increase cement will soon hopelessly distance iron and be entitled to recognition as the great utilitarian product of our age.

Cement has come to stay. On the farm there are innumerable uses to which it can be applied. You can make fence posts, irrigating pipe, blocks for your house and barn, pillars with ornamental tops, etc. Good tools and carefully made moulds are the only requirements to make permanent, beautiful and economical products. You can also manufacture in excess of your own needs and easily dispose of your surplus in your immediate neighborhood.

The tools and forms manufactured by T. A. McMurtrie, of Stockton, are complete in every detail. If you are interested in this fascinating work we suggest that you write him for his illustrated catalogue, which gives much valuable information on the subject of cement.

Live Oaks Farm

Frank A. Meacham, Proprietor.

Importer and breeder of RED POLLED CATTLE, SHROPSHIRE SHEEP, RAMBOUILLET SHEEP, HORNLESS AMERICAN MERINO SHEEP. Both sexes for sale. Take electric car at Petaluma or Santa Rosa for LIVE OAKS STATION. Address all mail to Petaluma, Sonoma Co., Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure

MISCELLANEOUS.

Learn Wireless and R. R. Telegraphy! Shortage of fully 10,000 operators on account of 8-hour law and extensive "wireless" developments. We operate under direct supervision of Telegraph Officials and positively place all students, when qualified. Write for catalogue. Nat'l Telegraph Inst., Cincinnati, Philadelphia, Memphis, Davenport, Ia., Columbia, S. C., Portland. Ore.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines, farm machinery that will do same work as new at half price. Small distillate tanks, 50 gallons up. Domestic and irrigating tanks, galvanized and redwood, 500 to 10,000 gallons, also 50,000 gallon redwood tank, fine for storage or irrigating. Steam engines with steam pumps; gasoline engines, 3 H. P. Fairbanks engine, geared pump jack, pipe, pump complete with 22 ft. tank stand, 2,000 gallon tank all for $150, also many other sizes. Special 20-day bargain; 12 H. P. Fairbanks engine, No. 2 deep well Ames double acting pump jack, 65 ft. casting, rods, and double acting cylinder, 50 ft. belt, all complete and now pumping 20 inches water from 65 ft. well into large resorvoir 110 ft. on top of hill. Our price $380 on cars if taken before we have to move it. Also another complete mounted wood sawing outfit, $300. Gang, disc, road, riding, walking plows, cultivator, feed rack, bone grinder, Fresno, wheel and slip scrapers, wagons, surrey, grading tools, sundries. Demmitt Co., upstairs, 120 N. Main, Los Angeles.

For Sale—15 H. P. gas engine. Since taken in exchange for a larger one, we have put it in first-class condition. Can make right price. Baille & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

For Sale—38 H. P. distillate engine. Has been entirely overhauled and we guarantee it to be as good as new. Machinery Exchange, Main and Bruno Sts., Los Angeles, Cal.

DAIRY SUPPLIES.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey, 108 E. 8th St., Los Angeles, Cal.

When writing advertisers, mention Cultivator.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents.
Our classified columns are the clearing house for our many thousand readers.

WANTED.

Local Representative Wanted—Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres. The National Co-Operative Real Estate Company. Suite 448, Marden Bldg., Washington, D. C.

Farm Manager—Covering years of practical and scientific dairying, sanitary and certified milk, grade and registered stock, East and West, is open for similar position. Or, if preferable, would consider proposition to hire your farm for term of years, on share or cash rental, if carrying 50 to 150 deep milkers, tools, etc.; sterling references. Address Manager, Box 34, Parker, Arizona.

Wanted—Your work pays the expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. United Trade School Contracting Company, 647 Pacific Electric Bldg., Los Angeles, Cal.

Help Wanted—We want several good solicitors to solicit for a high class suburban monthly publication. Good profitable employment to the right party. For particulars address Box H, Cultivator Office, Los Angeles.

Wanted—Agents everywhere for the Perfection Hot Pan Lifter, 4 articles in one. 25c. Just out. Every woman wants one. Good commission. Geo. N. Bartlett, 402 Mason Bldg., 4th and Broadway, Los Angeles.

300 Farms Wanted—Let experienced, reliable people sell or exchange yours. Have customers. Give directions how to reach. Parrish Barker, 207 Union Trust Bldg., Los Angeles.

Wanted—Position as Ranch Superintendent by a reliable, trustworthy man. References. Address 141 S. Griffin Ave., Los Angeles, Cal.

Wanted—To correspond with breeder thoroughbred Polan China hogs. Address, R. P. Smith, 1503 Wilton Place, Los Angeles.

TREES.

For Sale or Exchange—500 Acacia (Melanoxylon), 2 feet out of 4-inch pots; 500 Phoenix Canariensis, 2 years old in gallons; 500 Guavas (Strawberries), 4-inch pots; 200 Monterey Pines, 10 to 12 feet high. Very low for cash or will take deciduous fruit trees, if first-class, in exchange. Address H. L. Bauer & Son, 737 South Spring St., Los Angeles, Cal.

Ornamental Eucalyptus—Cleanest and best shade trees for the ranch. Acacias, pines, etc. Large stock. Ballou's Nursery, 728 East Orange Grove Ave., Pasadena, Cal.

Marsh Seedless Grapefruit—600 large trees for sale. E. S. Thacher, Nordhoff, Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal.

Fine Line of Navels—Valencias and Eureka lemons for delivery spring of 1911. Contract now and get the first choice. The King Citrus Nurseries, Whittier, Cal.

LIVE STOCK.

For Sale—Registered Holstein Bulls; 1 to 2 years old. Some sired by Prince Juliana, brother of former world's record heifer, Juliana De Kol. Dam and granddam, A. R. O. cows. Three record-breakers in some of their pedigrees. M. E. Sherman, Minnewawa Vineyard, Fresno, Calif.

Registered Jersey Cattle—As my herd is small I offer for sale either a son or grandson of Golden Fern's had. Quality not excelled on the coast, and perhaps not elsewhere. Henry H. James, Fair Oaks, Sacramento Co., Cal.

Milch Goat Stud—"Andreas Hofer," imported registered Saanen buck, a proven getter of 4 to 5 quart does even by Angora dams. Fee, ten dollars, including care, feed and cartage. Bred does for sale. R. M. Cartright, San Luis Obispo, Cal.

Milch Goats—Pair young Toggenburg-Saanen does bred to imported Saanen stud, $25.00 each. Three-quarter Toggenburg buck, remarkably fine, $35.00. B. A. R. Stocker, San Luis Obispo, Cal.

Registered Shorthorn Bulls and Poland China Hogs for sale. Best breeding. P. H. Murphy, Perkins, Cal.

SEED.

Some Choice New Crop Eucalyptus Seed for sale. Apply George Schornick, 202 N. Mott St., Los Angeles. Telephones—Boyle 1665. Home 41536.

REAL ESTATE.

OWENS RIVER VALLEY—You are invited to see the products of this wonderful valley now on exhibition.

In our office you will see corn, equal to the best produced in Illinois, Iowa or Nebraska. You will see photos showing this corn growing 14 feet high and be told that 80 bushels to the acre is not uncommon.

You will be shown apples, potatoes and onions and your first remark will be "The best I have ever seen in California."

You will be shown timothy hay with such heads that you will acknowledge you never saw their equal before.

You will see red clover, wheat and red top, all of which will prove to you that a country which can produce it must be a good one.

You will see honey equal to anything produced in America, honey that took the first prize at the Portland Fair.

You will be told of a country more perfect in climate than you have dreamed of and as beautiful as a combination of mountains and valleys could make it.

If farm lands interest you at all, you should come to our office, if only to satisfy your curiosity. You owe it to yourself to at least see what we have to offer, before making your decision.

Send for booklet. JAMES R. H. WAGNER, H. S. COOK, Sales Agents, Room 13, 329 South Hill St., Los Angeles, Cal.

FARM LANDS FOR SALE.

For Sale—

Alfalfa land in a genuine Southern California Alfalfa District.

A loam, level as a floor.

Every foot of it water-bearing.

One of the few close-to-railroad, high-grade, bottom-valley-land, irrigable ranches remaining at a very moderate price.

Will make a fortune in dividends and increased value as an alfalfa shipping or dairy proposition.

Near Riverside.

260 acres, partly developed, has 50 H. P. pumping plant.

Nearby an aggregate of 2000 acres in perfect stand dividend-paying alfalfa.

Don't let the other fellow beat you to it.

John W. Thompson, 522 S. Main St., Los Angeles, Cal.

For Sale—The Blackstone Tract of 280 acres in Fresno Co., 14 miles from Fresno, has been subdivided into 20 and 40-acre lots and is now on the market at $125.00 per acre, and is classed with the best lands in San Joaquin Valley. It is all level, no alkali, subirrigated and situated in the center of a dairy and fruit-raising district. Land has had two plowings this year and is now ready for planting to alfalfa, grain, or fruits. Samples of soil sent to Berkeley gave the following: "Your land is suitable for alfalfa, peaches, pears, and Thompson Seedless grapes and grain." I have a good water right with place in 2 companies. For particulars write to Geo. H. Hudson, Conejo, Fresno Co., Cal.

Tulare County—Do you want a fine 40 acres for alfalfa, dairy and hogs, fruit and poultry? Then look at this. 40 acres 6 miles west of Tulare (less about 3 acres in school grounds) in the greatest dairy section in the state. This will make a fine alfalfa ranch as the soil is right, the water is right, and the climate is right. Land is level and the roads are good and it is in a fine neighborhood. I can make the price right and the terms right as it has to be sold at once. Investigate at once. E. D. Cowan, 301 Mason Opera House, Los Angeles, Cal.

Alfalfa Ranch of 86 Acres—63 acres in alfalfa. Splendid water right. Close to good market, 1½ miles from good town, fine schools, $22,000. Terms. Some good bearing orange and lemon orchards in practically frostless belt. Splendid water rights. 55 miles from Los Angeles. Splendid climate. Correspondence invited. Ben F. Thorpe, Fillmore, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—11-acre walnut, fruit and vegetable ranch just outside city limits of beautiful Santa Barbara. Location finest can be had, situated on main thoroughfare between San Francisco and Los Angeles. Comfortable buildings, an abundance of water. Will sell cheap if taken at once. For further particulars address M. E. Hill, Route 2, Santa Barbara, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

20-Acre Ranch—In the orange belt north of Exeter. 10 planted to oranges, well that tested over 100 inches, with pumping plant installed. Electric lights, running water, and ideal location. ½ mile from railroad. For one desiring a home, they could not find things nicer or location better. Address Box 103, Visalia, Cal.

$6,500 Buys 120 Acres—Situated 3 miles south of Santa Maria, good improvements, plenty water, orchard, large barn and corral, chicken houses, windmill, tank, tank house, and modern six-room cottage with bath and pantry. Every modern convenience. Address R. Morrison, Owner, Santa Maria, Santa Barbara Co., Cal. Box 171.

POULTRY.

For Sale—A few choice White Rock cockerels hatched from eggs bought of U. R. Fishel, Hope, Indiana. The eggs cost me $8.00 per setting and $2.00 expressage. "Fishel's White Rocks are the best in the world." You should get one or two of these cockerels and introduce some new blood direct from Fishel in your flock. It will prove a great investment for you. Some of them are good enough to exhibit in any show. Price $3.00, $5.00 and $7.50 each. Mrs. E. E. Young, 444 East 48th St., Los Angeles.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

Household Department

FULLY IDENTIFIED.

It was at the baggage rooms in the Fort Street Depot. The woman had lost the check for her trunk, and, as is usual in such cases where no suspicion was entertained, she was asked to identify her baggage.

Oh, I can pick that trunk out of a thousand. It was a zinc-covered trunk, with a strap around it, and it had a big W for White on each end. It was a trunk my sister bought in Cincinnati and paid $6 for, and after she got crippled up with rheumatism and couldn't get out any more, she sold it to me for $2. There it is now. I'd swear to that trunk in Africa!"

"But about the contents, ma'am. You have the key.

"Of course I have. I had this key made in Buffalo last week. I lost the other key about a year ago, and I always believed that Mrs. Robinson's baby swallowed it while I was there visiting. The poor thing had cramps for three months after I left, and she wrote me the other day that she never expected it would be a healthy child again."

"Describe the contents," said the officer, as he pulled the trunk down.

"Well, let me see. We'll begin with the till first. There's my bonnet in the bonnet box. I paid $7 for it in Buffalo last year, and had over $2 worth of trimmings put on last week. I don't know as I shall want to wear it once while here, but I thought I'd better bring it along. I was never quite satisfied with that bonnet, but I suppose—"

"What else " interrupted the man.

"There's a black fan which cost me 90 cents. I got it at a sale, and everybody says it was a bargain. My sister Emily was with me the day I bought it, and she could swear to it if necessary. She advised me to get a white fan, but I prefer—"

"I don't care about the particulars, ma'am."

"Oh! you don't? Well, there'a a black shawl in there that used to belong to my Aunt Eunice. She had it for ten years before she died, and then it fell to my mother. Let's see. The shawl must have been in our family for—for—"

"Go on, ma'am."

"Then there's my black silk dress. I paid $1.50 a yard for it in Buffalo, but I got cheated. I hadn't worn it but twice when the silk cracked and creased all up. I went back and told the clerk about it, but he wouldn't do anything about it. Next time I buy a silk dress I propose—"

"Never mind about the dress."

"The waist was beaded."

"I don't care about that."

"Well let's see. Oh, yes; on the bottom of the trunk are four sheets I was bringing to my sister. I made and bleached 'em myself. She's got four boys, and the way they do kick the sheets out is something awful. I don't suppose I could have brought anything else she would—"

"What else?"

"There's a pair of gray pants on top the sheets—an old pair belonging to my husband. They are worn a litle thin on the knees, but they will do to cut over for one of the boys. I've brought up three boys myself, and I know how awful they are on pants. Sometimes it wouldn't be four weeks before—"

"You can have the trunk," bluntly replied the baggageman.

"But there's a lot more things to mention yet. There's three pairs of new—"

"Take it away!"

"And I forgot to tell you that there are—"

"If you want your trunk, here it is!"

"Well, I'll have a man take it away. I lost my check and I wanted to satisfy you it was my trunk. If you'd give me time I'd tell you about the coat with a fur collar, and the two pairs of suspenders for the boys, and—"

The baggagemaster walked off, and after waiting around two or three minutes with a disappointed and dejected look she sorrowfully told the expressman to carry the trunk to his wagon.

TAKE CARE OF YOUR EYES.

An eminent occulist says that if people would keep free from nervous prostration they must have respect for their organs of sight as he thinks constant eye strain is one cause of this prevalent malady and he says that we should pay 'especial attention to making the eyes relax on every possible occasion when they are not in actual use. It has been said that fancy work was an invention of the evil one to tempt industrious wome to work beyond their capacity, and instead of resting her eyes when she has the opportunity she harnesses them up for close work. The overworked nerves back of the eyes react on the other nerves of the body and cause the nervous break-down and the doctor's bill which is sent for services to her at the end of the year would pay ten times over for those pieces of fancy work and she would have been saved weeks of distressing illness.

The eyes should never be used when they are tired or weak from illness, and the light should always fall on the work or book from over the left shoulder. A good way to strengthen the eyes if they are inclined to be weak is to bathe them every morning while washing the face, then take a towel, one end in each hand and draw it across the back of the neck for a few minutes, as this relieves congestion and stimulates the blood and nerve vessels to renewed activity.

An excellent solution for bathing weak eyes is made by dissolving a little boric powder in warm water, but if the eyes are sore or inflamed a little spirits of camphor should be added. To prepare this solution, put one teaspoonful of the boric powder in a teacup and a few drops of camphor and rub to a smooth paste, then fill the cup with boiled water. strain and bottle and when bathing the eyes, use an old soft linen cloth. A weak boric solution is fine for the eyes of young children and the boric water is all that is needed when the eyes are sore or inflamed, and if this is used at least once a day, the eyes will be greatly strengthened.—A. H.

AN IRISH RACE.

Two Irishmen were about to run a race to a certain tree by different routes. Suddenly Mike slapped Pat on the back and asked how they were to tell who reached the destination first. After a moment's thought Pat answered:

"I tell yer, Mike, if I get there first I'll make a mark on that tree with this chalk, and if you get there first you can rub it out."—Judge.

A HOSPITALITY HINT.

When I expect a guest from a distance, I purchase a number of souve nir post-cards of our home town and after stamping them place them on the desk in the guest-room where they can be addressed and sent back without any shopping being done by my guest.—From Woman's Home Com panion.

TWO WAYS OF LOOKING AT IT.

"Johnny," said his mother, "isn't i rather extravagant to eat both butte and jam on your bread at the sam time?"

"No, mother, I think it's econom cal," answered Johnny, "for the sam piece of bread does for both."

Just Six Minutes to Wash a Tubful!

THE QUARREL.

Now, Willie Johnson, yesterday,
He makes a face at me, an' say
He's glad he ain't a little girl,
'Cause he don't have no hair to curl
An' his face don't have to be clean—
An' so I tell him 'at he's mean,
An' I make faces at him, too,
An' stick my tongue out! Yes, I do!

Nen me an' Willie Johnson fight.
I know 'at girls must be po-lite
An' never get in fights—but he
Got in the fight; it wasn't me.
An' so I tored off Willie's hat
An' give him just a little pat
Up 'side his face, an' he just cry
An' run home like he's 'fraid he'll die!

So pretty soon his mama, she
Comed to our house—an' looked at me!—
Nen goed right in where mama is—
She tooked 'at tored-up hat o' his,
An' Missus Johnson she just told
My mama lots o' things, an' scold
About me, too—'cause I'm outside
An' hear—th' door is open wide.

Nen Willie comed out wif his pup
An' say "Hullo!" So we maked up
Nen go to playin' an'mal show—
His pup is a wild li'n, an' so,
W'y, he's a-trainin' it, an' I'm
Th' aujence mos' near all th' time.

An' nen our mamas bofe comed out.
His mama she still scold about
Me slappin' him—an' they bofe say:
"Hereafter keep your child away!"

An" nen they see us playin' there
An' they bofe say :"Well, I declare!"
—Wilbur D. Nesbit, in Harper's Magazine.

PICKLES.

Sweet Cucumber Pickles.

Cut ripe cucumbers in halves, paring them, scrape out all the seeds, cut into strips and soak overnight in salt water. To every quart of vinegar add one pound of sugar, boil and skim, then boil the cucumbers in the vinegar until tender and transparent. Take out the pickles, strain the vinegar, return to the fire with a small bag of mixed spices, boil two hours, pour over the pickles, cover, and set away in a cool place.

Watermelon-Rind Pickles.

To each quart of best vinegar add three pounds of best brown sugar. Bruise four ounces of stick-cinnamon and two ounces of cloves, put into a muslin bag and boil with the vinegar for five minutes, then pour over the rinds, previously pared and all the inner pink portion cut away, and let stand twenty-four hours. Strain off the liquid and after heating it again pour over the rind, letting remain twenty-four hours, after which boil all together for a short time.

Chili Sauce.

One peck of tomatoes, three cups each of peppers and sugar, two cups of onions, one cup of salt, three pints of vinegar, three teaspoonfuls each of cloves and cinnamon, two teaspoonfuls each of nutmeg and ginger. Chop tomatoes, peppers and onions fine and let stand in salt water overnight, then drain. Boil all together three hours, taking care not to scorch.

SOME GOOD RECIPES.

Cream of Spinach Soup.

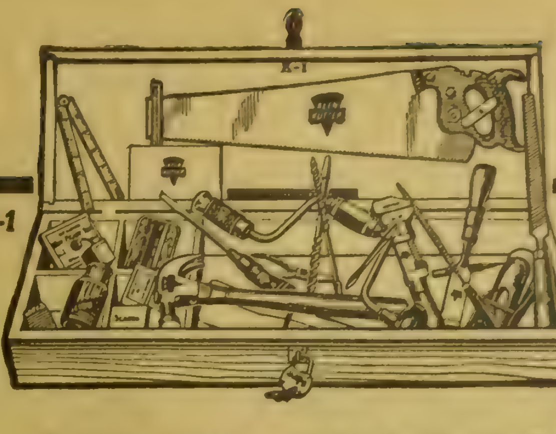
Boil one quart of spinach and strain it through a colander. Melt one tablespoonful of butter and stir in one tablespoonful of flour until smooth; then add one quart of milk, a pinch of salt, and the strained spinach, and boil about a minute.

Potatoes Roasted in Pan with Beef.

Peel the potatoes and boil them until half-cooked. Then pour off the water and put the potatoes in the roasting-pan with the beef. Baste them often with the beef gravy and serve them on the platter with the beef.

Corn Pudding.

To one canful of corn add a cupful of milk, half a teaspoonful of butter, and pepper and salt to taste. Boil it until tender, and then allow it to cool. Beat thoroughly two eggs, and, when the corn is cool, stir them into it, and pour the whole into the bowl in which it is to be served. Bake for twenty minutes.—Harper's Bazar.



No. K-1 **Price $8.50**

KEEN KUTTER Tool Cabinets

A boxful of tools—good tools—just the kind you would select were you an expert carpenter or cabinet maker. That's what you get when you buy a Keen Kutter Tool Cabinet. In fact these are the only tool cabinets made containing a complete set of tools under one trade mark and guarantee, and it's a real guarantee—a fair and square guarantee—one that refunds your money if you are not fully satisfied.

Every tool has a place of its own and it's there for service. Whatever the tool—however hard the work—you won't be disappointed.

Keen Kutter Tool Cabinets are made in many different sizes, the prices varying with the number and kinds of tools selected. There's the $8.50 size containing enough tools for any ordinary job, several between this and $50.00 and one at $125.00, which includes work-bench, vises, etc.

Deciduous Market

Sacramento, October 15, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, October 14th, 1910:

Pears:

9 cars; Winter pears will continu to go forward in small volume next week when shipment is expected to close.

Grapes:

386 cars; Grape shipments for the week show a falling off of over 7 cars and for the coming week the decline will probably be considerably larger. There are not a large number of Tokays left in the state, but the supply of Cornichons and Emperors will be ample for some time to come, as not many have been shipped up to the present time.

Weather conditions during the past week have been unfavorable. Light rains fell during the early part of the week and it was expected that this would make a material difference in shipments. However, the rainfall was light and was followed by favorable weather, so that the Tokay movement has begun again. Should there be no further storms it is possible that a considerable number of cars of this variety will yet go forward. At this time in the year, however, the weather is always uncertain and heavy rains at any time may practically stop the movement.

Citrus Market

LOS ANGELES, Oct. 19, 1910.

There are about 250 cars of Valencias yet to go and from present indications all will be forwarded before Novembe 1st. Many of the shipments now being made are of very small fruit. Some full cars have been sent, every box o which were small off-sizes. This accounts for some low quotations give in the auction reports following. The general tone of the market is, however very strong, and good fruit of regula sizes is met with a very firm market.

The Florida new crop is already beginning and for early fruit is of good quality. Of course it goes without saying that fruit at this time will be green and will not interfere with the Valencia market. The earlier Navel shipments may be confronted with large shipments of this early fruit.

The lemon market is exceptionall strong and insufficient fruit is being cut to meet the demands.

Shipments.

Shipments of citrus fruit to date since November 1st, 1909: 29,817 car of which 25,173 were oranges and 464 lemons. To same date last year 37,685 cars of which 31,591 wer oranges and 6094 lemons.

NEW YORK, Oct. 18.—Six cars sol Market firm on good fruit. Weathe clear and fair.

CHICAGO, Monday Oct. 17.—Lemon firm; offerings limited and there is fair trade. Boxes, California choice $5.75@6.00; extra choice, $6.25@6.50 common, $4.50@5.00.

Oranges sell slowly and are in ligh supply. Boxes, late Valencias extr choice, $4.25@4.50; choice, $3.25@3.75 grapefruit, Florida crates, $3.50.

CINCINNATI, Monday Oct. 17.—Warm. Market steady. Two car Valencias one car lemons and one ca Florida oranges sold. Florida Bright sold from $1.90 to $2.40.

ST. LOUIS, Monday Oct. 17,—Favorable. Market firm on good fruit. One car lemons sold.

LEMONS—Coyote, OK Ex, $5.80; Blue Jay, $4.60.

NEW YORK, Monday Oct. 17.—Offerings today comprised nine cars of Valencias. The market opened very strong and active and prices held an upward trend until the close. The market is now depending almost entirely on California for the supply of oranges and the possibility of prices under present conditions are almost unlimited. The outlook is certainly very favorable and every indication seems to point to still higher prices.

A small offering of 400 boxes of Jamaica oranges put through the auction today was eagerly taken at prices ranging $3.20 to $3.90 for fancy with choice $3.15 to $3.30—averaging $3.78 and $3.21 respectively. The sale of this fruit at the above prices readily reveals the fact that oranges are wanted and wanted badly.

An offering of 25 barrels of Almeria grapes sold today at auction. The condition of the fruit was generally poor with much wasty stock and rain damaged fruit in evidence. The market cannot be quoted as lowering to the condition. Best fruit sold $3 to $4 per barrel, with others selling down according to condition. Very little fruit is arriving that is fit for storage.

A considerable quantity of grapsfruit from various sections was sold today. The total amount was 3700 boxes. The fruit as a rule was rather ordinary, which coupled with the liberal supply produced a market that was inclined to be weak. Florida ranged $2.25 @ $4.75. Porto Rico, $1.95@3.50. Jamaica, 2.00@3.00, and Cuban, $2.25@3.50. The Cuban stock was best. The weather today was clear and cool.

Sumclass, Stewart F Co	4.50

NEW YORK, Tuesday, Oct. 18.—The offering today comprised six cars of Valencias. Taken altogether, the market can be safely quoted as firm, although some comparative prices appeared to be slightly lower, but this was due more to the quality of the fruit than a weakening of values.

A fair sized offering of Porto Rican oranges, consisting of 1200 boxes, was put through the auction and was eagerly absorbed by the trade at excellent prices. Prices ranged $1.80 to $3.30, with fancy stock averaging $2.84 and $2.89, and choice fruit $2.30, $2.38 and $2.43. The fruit was of fairly good color and cut well for this season of the year.

Grapefruit, with the exception of some fancy Porto Rican and Florida stock, sold low and met with a poor reception from buyers, who already have sufficient to fill all immediate orders. A small quantity of Porto Ricans sold at $3.50 to $5.75, with the bulk at $1.87½@3.50; fancy Floridas, $3.50@ .62½; bulk, 2.37½@3.62½; Nassau grapefruit, $1.75@2.00. The weather today was fair.

THE ALMOND SITUATION.

SACRAMENTO, Oct. 17, 1910.

The California Almond Growers' Exchange writes:

To date we have shipped out 20 cars and have orders for 15 more to go within the next two weeks. These have been moving at satisfactory prices and as seven cars have been sold in the last three days you can radily understand that as our holdings have been already reduced to about 53 cars unsold, and that two or three weeks of active demand now for the holiday season, which is ahead of us, may wipe out the entire supply.

Several of the associations have finished delivering and have everything in the warehouses. Most of the others are nearing the end and we think shortly we will have everything under cover in the warehouses and in a position where we can load out cars promptly.

Those who have bitter and hardshell almonds will please put them in shape for market and deliver them at the association warehouse as soon as possible.

PATAGONIA STRAWBERRY.

Fifty years ago the only strawberries on the market were the tiny wild ones to be had but a few weeks in the summer. But they were well worth waiting for. Was there ever anything more delicious than the first strawberry shortcake. But our nurserymen and plant specialists have been at work on this most popular of the berries until now in California we can have them fresh practically any day in the year, great luscious fruits that bear little resemblance to their wild progenitors save in the appeal to the palate. The latest word in strawberry perfection has been spoken by Luther Burbank and to show for it he exhibits his "Patagonia Strawberry," said to combine the desirable qualities of other varieties and to surpass them all in prolific fruiting. This is a handsome fruit, conical in shape, of superb coloring, fine texture and a delicious flavor suggestive of pineapple. The vines are thrifty growers and prolific bearers, under intensive culture bearing freely a gallon of fruit to the plant. A striking characteristic is that the fruit is borne off from the ground, thus insuring cleanliness and perfect ripening. Both commercially and from a culinary standpoint the Patagonia strawberry has everything in its favor. The commercial berry planter who first grows it in a given locality is sure to command the trade, for its superb qualities place it in the front rank among particular customers. Plant growers and strawberry specialists who may be interested in this new fruit, can learn more about it by addressing the introducer, Mr. Luther Burbank, at Santa Rosa, California.

The LaVerne Rotary Cultivator

The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

The Midwinter Tomato in California

Midwinter commercial tomato culture has of late grown to be an industry of importance in the thermal or regions free from biting frosts in California. It gains its importance from the fact that conditions of soil and climate make possible its commercial culture during the winter months when the Eastern markets are ready to take large quantities of fresh garden vegetables. Areas adapted especially to the tomato in Southern California are the Whittier region in Los Angeles and Orange counties, the Cahuenga, Eagle Rock and portions of the San Gabriel valleys. The annual winter shipments to Eastern markets are increasing as the industry is being developed. The usual practice is to sow the early varieties along about the middle of August in shady situations. Be sure to keep the little seedling plants in a thrifty condition; transplant about the 15th of September in rows five feet apart and an equal distance apart in the rows; keep them well watered and hoed. The late or summer fruiting crop is usually sown about the first of the year in frames or pot beds to insure protection from frost; plant out and cultivate after frost danger is past and cultivate as for winter crop.

The more prominent sorts recognized commercially are as follows:

Sparks' Earliana. An early, smooth, bright red tomato of good size. It has been developed in the light warm soil of southern New Jersey, where every effort is made to market tomatoes at the earliest possible date; fleshy, solid, and excellent for shipping purposes.

Chalks Early Jewel. A large, smooth, fine flavored, extra early sort. Indeed, it is so hardy and vigorous in growth that early planting can be made in the open ground. The tomatoes come in good-sized clusters and are uniform in size and shape. The fruits are deep through from stem to blossom end; the solid flesh is entirely free from hard core, streaks, or blemish. The ripe tomatoes are of a scarlet color.

Stone. Fruit large and deep; bright scarlet; smooth, ripening evenly to the stem without a crack; exceedingly solid and firm-fleshed, of the finest quality; one of the best for canneries.

Ponderosa. This is one of the largest varieties; although somewhat irregular in shape; quite a favorite in northern portions of the state for canning.

Dwarf Champion. An early and distinct variety, medium in size, plant of dwarf and compact growth; popular in the warmer interior regions.

Early Richmond. A favorite winter variety with Los Angeles gardeners in frostless districts.

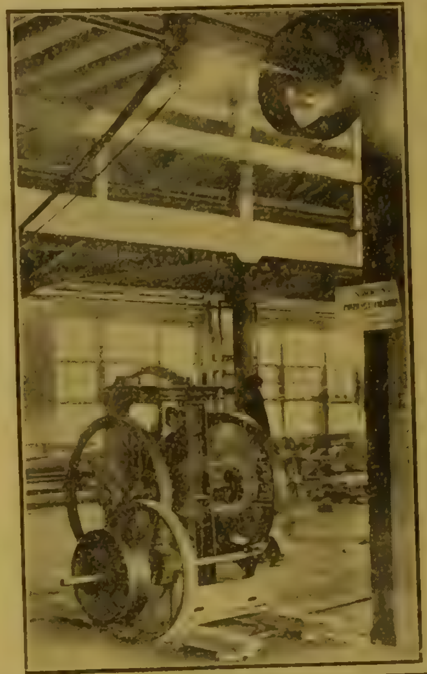
The Luitwieler Non-Pulsating Pumping System

Best For Deep Well and Irrigation Works



Pump Talk Continued:

We wish to say to our friends an prospective customers that Luitwieler Pumps are constructed of the very best materials and workmanship throughout.

The cast iron parts are made of the very best soft gray iron castings; the cam shafts of soft turned steel of high tensile strength. The roller bearings are made of the very best cast phosphor bronze. The main bearings are made of high grade babbit. The actuating cams are made of chilled carwheel metal chilled on the surface from three-quarters of an inch to one inch deep. It is impossible to machine them, and they can only be ground to size by use of the very best carvourundum wheels.

Our aim is to deal perfectly fair with all customers, and we make no claims verbal or written that we are not willing to absolutely guarantee in writing.

Give us a trial and be convinced that we make good.

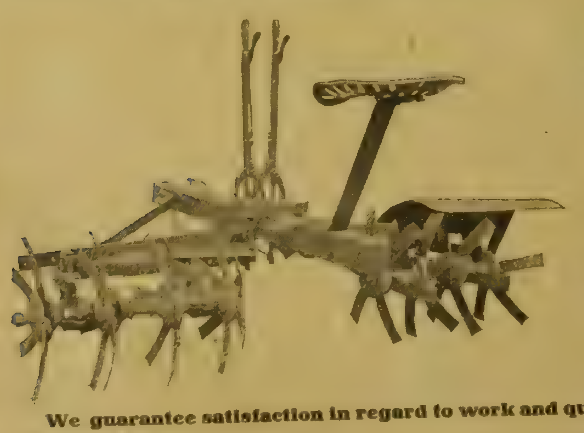
The LaVerne Rotary Cultivator



The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

Vol. XXXV—No. 17 Los Angeles, California, Thursday, October 27, 1910 Subscription $1 a Year

An Instructive Farmers Week at the University Farm

Formerly Called a State Farmers Institute, the Farmers Week Program Proves Equally as Attractive.—This Year's Attendance Good.—Improvements at Farm.

The farmers of the Sacramento Val[illegible] and the northern end of the San [illegible]quin Valley should show greater [illegible]preciation of the opportunities of[illegible]ed them by the most excellent six [illegible]ys program which is an annual feature at the University Farm at Davis. This program is arranged for the so-called Farmers Week, occurring about the middle of the short courses held every fall soon after the beginning of the regular agricultural high school course. The students of the three-year high school course attend some of these lectures as a part of their regular school work. It is most interesting to watch these young fellows taking notes, and we believe it is safe to say that amongst the interested spectators they show the most perfect attention. Farmers Week is supposed to be for the benefit of the farmer who is unable to take even the short courses but simply goes for an annual brushing up and inspiration to more intelligent effort in his farm work. The attendance was this year rather better than in the past and the accommodations at the Farm are improving so that one may now attend with less discomfort than in former years. The dormitory has a capacity of only sixty, but hopes are expressed that before another year larger quarters will be completed. There are now between 60 and 70 regular students in the school, but the young fellows doubled up so that accommodations were made for many of those attending.

This dormitory, by the way, is worthy of a word in passing. The matron, Miss Katherine Winans, formerly of Los Angeles, is making it as far as possible an ideal home for the boys. We say "as far as possible," for of course no such wholesale family can have quite the comforts of home. The charges for the rooms run from four to six dollars per month. This does not include linens though it does include their laundering. Across from the dormitory is the new dining hall only recently completed. Satisfactory meals were supplied not only to the students but to all attending the Farmers Week. The students are charged at the rate of eighteen dollars per month for table board.

Improvements.

A look over the farm develops the fact that there are several new buildings since the last year's Farmers Week. The horticultural building at that time under construction is now completed and Room Six furnishes a most comfortable meeting place. The stock pavilion accommodates a much larger audience but the drafts of air passing through it at times make it very uncomfortable. If such meetings are to be continued and the audiences are as large as they should be considering the value of the programs, a larger auditorium should be provided. Another new building, attractive in appearance and of value from an educational standpoint, is the veterinary building. It is scarcely completed but already some of the appliances are installed and form the beginning of very complete veterinary work. A large new horse barn and another almost as large for the sheep are other additions to the stock features of the farm. This latter is complete, as is the dairy barn which was finished more than a year ago. Another new feature which is just being completed, in fact, the painters were only beginning their work during the institute week, is the poultry colony consisting of incubator house, seed house and brooders. The regular high school students are expected to take care of the incubators and keep records of fluctuations in temperature and conditions of moisture, and in every way handle incubators and brooders as if they were engaged in the poultry industry for themselves.

One more need for the farm is an administration building. The officers are yet housed in the dairy building. This is not convenient and does not permit of as effective work as if there was a building especially constructed for that purpose.

Exhibits.

A more complete line of exhibits was made this year than at any previous Farmers Week program. Almond hullers, hay derricks, gang plows, equalizers for three or more horses, harrows, cultivators, and other farm implements were exhibited west of the horticultural building.

The Program.

The embarrassment of attempting to give a six-days progrem, each day consisting of three sessions—in fact two programs were often given in two rooms at the same time—is such that it will not be attempted at all. Hence we can only refer in the most general way to the entire week. We may say that the program was so varied that almost every department of agriculture received its just recognition. The program of each day began at eight o'clock with lectures by Prof. Hopper on some feature of dairy or creamery experience. This meeting usually adjourned at nine o'clock when the day's program was continued in Room Six of the horticultural building. The first feature of the afternoon session was usually also a dairy topic considered in the dairy building.

The force giving lectures along dairy and live stock lines consisted, in addition to Prof. Hopper, of Prof. E. W. Major, Dr. Chas. Keane, State Veterinarian, Prof. Haring, Howard Phillips, J. S. Thompson, and Dr. Geo. S. Baker, Inspector of the Bureau of Animal Industry at San Francisco. The lecturers along horticultural lines were Prof. E. J. Wickson, Prof. F. T. Bioletti, Viticulturist, Prof. W. T. Clarke, Judge Peter J. Shields, Prof. I. P. Roberts, Prof. G. W. Shaw, Prof. F. H. King, Prof. C. B. Lipman and I. C. Bridwell. Prof. P. A. Etchervery gave a series of interesting lectures on concrete in irrigation structures and other irrigation topics.

The greatest interest in any one program was probably manifested in the Thursday country life conference. This was in charge of W. A. Beard of Sacramento. The two main problems discussed in that conference were labor to meet California conditions, and education. After discussing the question of education and the need for encouraging more effective conducting of rural schools, the following resolutions presented by a committee headed by E. T. Pettit, Master of the State Grange and O. A. Stebbins, Secretary, were unanimously adopted:

Resolved, by the California Conference on Country Life, held at the University Farm, Davis, October 13, 1910, at the call of the Agricultural College of the University of California, that, after a careful consideration of the full discussion of the day, we believe there should be undertaken a distinct effort to develop the full possibilities of country living in this state. The most important point to be considered concerns the improvement of the public schools, especially those in rural districts, which should be made the subject of state-wide discussion. To attain this end we request the chairman of this Conference to appoint a committee whose duties shall be to canvass the field, and if they deem it desirable, to call a state conference of farmers, educators and others interested in country life, for the consideration of the educational problem.

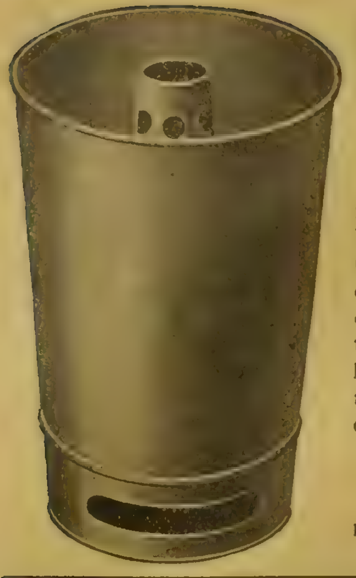
This matter of country life was touched from practically every side. As an instance we may mention one discussion which was on the mission of the country church, by Rev. Arthur Hicks, Field Secretary of the Presbyterian Church. Mr. Hicks took the position that the country communities were over-churched. He spoke of many little communities which could barely support one church, and yet were burdened with three, four or five organizations struggling to maintain existence. He urged that these organizations unite, not to form a union church, for he felt that would be a great error, but to unite under one denomination. For instance, if in one community there are Methodists, Presbyterians and Baptists, the strongest in numbers should establish their denominational church and members of the others yield their personal preferences and join with them. Then the three organizations combining their finances can well employ a brainy man who will be able to attract the young people. Of course the speaker admitted the impossibility of carrying out this plan in many communities because some people are so denominational rather than Christian that they will still stick to their prejudices rather than unite for an opportunity to do good. The speaker further urged that the church take up social activities with greater zest, even urging a hot Saturday afternoon game of football, and athletics in every way, using such methods to make country life attractive as are used to make city life attractive. He spoke of the advantages of boys clubs, referring especially to the America Scouts. He also urged the establishment of libraries. If there is no other way to secure them the country should establish libraries in all rural communities.

One speaker, a lady from Yolo, took the ground that social activities could be better controlled by a country club for country people. Her belief in club life as the social center was confirmed by observations of one country club maintained by rural people which was exceptionally successful in adding attractiveness in social and literary ways and had also been a strong factor in the artistic upbuilding of the community. Her reason for preferring the club to the church for this form of activity was that there was less liability of friction.

Prof. Roberts of Palo Alto led in the discussion on the country church and endorsed the attitude of Rev. Mr. Hicks. He added that practically every successful life has been founded upon the proper observation of the eleven commandments. He referred to the good stuff in the average youngster born and brought up on the farm and urged the boys who were present to secure the best education possible that they might gain opportunity for greater work and greater accomplishment, also to make money. On this latter point, Prof. Roberts has little patience with those believing money to be a secondary matter. He would see the youngster make every effort to secure money honorably. Money is needed for the highest development. Above all he urged the upbuilding of the spiritual life that leads to highest and best endeavor.

The Labor Question.

The "blanket man" was discussed from all sides, and as a rule not to his credit. The Japanese laborer was touched rather mildly, and the discussion resulted in a practical argument that the laborer should be given more consideration on the ordinary fruit ranch. The bunk house and the indifferent food which is usually provided are the causes of the low grade of men who can content themselves with conditions of farm labor in California. The cottage for the laborer's family was deemed one of the best ways of encouraging a better class to accept work in the orchards. Another point was to make the products of the community as diverse as possible that labor could be guaranteed the year around to those who were dependent upon it for their livelihood.



Protect your crop from frost

This is the ***Troutman Orchard Heater*** and it is no prospect nor experiment, because it has been tested and affords absolute protection. Can you afford to take a chance on losing a crop which has cost you the labor and anxiety of a year? Josh Billings said: "It is no credit to a cow to give a pail full o' milk and then kick it all over." ***Send for descriptive matter*** and horest testimonials. Special prices if ordered this month.

Citrus and Tropical Fruits

SOIL FERTILITY.

W. F. Sutherst, Ph. D., F. I. C.,
Lordsburg.

The subject of soil fertility is once more to the front as a result of some recent investigations which in a sense have made it more puzzling and complicated than ever.

Essentials.

The fertility of a soil, in other words its power to raise crops, is known to be a function of the mineral plant food it contains (including water), size of soil particles, organic matter and soil bacteria, and it is absolutely certain that if one of these necessities is absent, the fertility is reduced to zero; but in some cases all have been present and still poor crops are produced. Some light was thrown on this subject some years ago, when it was proved that plant food could exist in the soil in a form that the roots could only take in minute quantities, but by cultivation, liming and other processes, could be rendered available. The small profit however obtained on farm produce, especially in Europe, induced the farmers to add mineral plant food to the soil in a form readily taken up by the roots, instead of waiting for the locked up substances to become available. Such substances as nitrate of soda, superphosphate and potash, were put on the market; and to their use must be ascribed the enormous yields of crops obtained in Europe, as compared to the states. The fertility of any soil is rated by ingredients present in the smallest quantity, just as a fleet gauges its speed by the slowest vessel, but it is extremely rare that one ingredient is entirely missing, so that one sees some kind of vegetation growing everywhere though the plants may be very far apart. Of course if a poisonous substance occurs in the soil, all fertility calculations are upset.

Mission of Bacteria.

The mineral plant food of soils has received most attention by the soil experts, but soil bacteria and their effect on the crop yields have been rather neglected. Recently, however, experiments were carried out at the Rothamsted Experiment Station in England on this subject with most astonishing results. Samples of soil partially sterilized, whereby part of the bacteria were destroyed by heat, gave increased yields of crops up to 100 per cent, and other samples sterilized by disinfectants gave yields varying from 30 to 50 per cent increase. This curious phenomenon was explained by proving that the heating of the soil killed most of the bacteria, but left unattacked those which produce ammonia out of the organic matter present in the soil. There is a certain temperature, about the boiling point of water, when all bacterial life is destroyed, but some are killed far below this. So by heating any substance such as a soil sample to a temperature below 212 degrees Fahrenheit, some of the bacteria will survive, others be destroyed. Not only is this an advantage in itself, but it gives the remainder a chance to multiply without opposition. The enormous number of bacteria thus produced will attack the complex nitrogenous matter in the soil, and convert it in a short time into ammonia, which the plant so easily assimilates.

Chemical Effect.

The effect of heat on the soil can also include the liberation of ammonia in a chemical way: any compound of ammonia heated with chalk, will liberate carbonate of ammonia which splits up immediately into ammonia and carbonic acid. This case has not been mentioned as a probable cause of the ammonia increase, but since the majority of soils contain chalk it is most likely that some ammoni is produced in this way. The reaso for the extraordinary fertility of o desert lands can be attributed to t intense heat to which it is subject during summer. This is sufficient bring about the increased activity the ammonia producing bacteria, and other less known effects, and the absence of rain permits this available plant food to remain in the soil till utilized by the aid of irrigation.

THE CITRUS OUTLOOK.

The following paragraphs are gleaned from an interesting interview with B. A. Woodford, manager of the California Fruit Exchange, in a late issue of the New York Fruitman's Guide, during his recent visit in New York City:

"While we do not agree with the railroads' estimate of 50,000 cars, we are perfectly willing to admit that California will have this season probably the largest citrus crop in the history of the industry. This state of affairs will prevail in both northern and Southern California, and takes in, as you will note by the use of the word 'citrus,' lemons as well as oranges. Up to date the quality of the fruit promises to be exceptionally fine, and as the proportions of the crop indicate, the sizes will be good.

"The lemon acreage is being increased all the time. The growers, encouraged by the assistance rendered them by the new tariff, have taken courage and are setting out more trees. This season the returns, too, were encouraging, owing to hot weather prevailing through the West and Middle West. At the same time it is not to be thought that the revised tariff was entirely responsible for the good returns made by California lemons. I have been shipping lemons from California for the past seventeen years, and I remember one or two years in the times when the tariff on Sicily lemons was practically next to nothing, when, owing to general market and climatic conditions, we had two years or so when prices were just as good as they were this year.

"Roughly speaking, there are about 20,000 acres now set out to lemons in California. We need another 20,000 before California can supply the United States with a sufficiency of lemons to meet all needs under any and all circumstances. Bringing a lemon orchard into remunerative bearing is a job that requires patience, nerve and capital. You cannot plant a lemon as you plant a potato. It will take you from ten to eleven years to bring your orchard into what I have called a really remunerative bearing state, and it will cost the man who wants to invest in such

Rex Lime and Sulphur Solution

The Famous Fruit Tree Spray and Animal Dip

This Spray has been sold throughout the United States more than any other spray in use, and the demand for same is constantly increasing.

a proposition, from $1100 to $1200 an acre before, at the end of, say six years, he has his trees in such a shape that they are to be considered in any way a commercial proposition. A man needs a lot of encouragement from every source if he is to lock up his money in such an investment, and then at the end of his ten years take chances on the vagaries of the wind and weather, and the fluctuations of the market—knowing all the time that he is dealing in a product which cannot be held for more favorable times, but has to be moved right along, willy-nilly. My figures as to the cost of bringing an orchard into bearing per acre are based on that knowledge that comes from trying it one's self."

MUTUAL ORANGE DISTRIBUTORS.

The Redlands Review calls attention to the fact that this institution was organized only four years ago. The Mutual Orange Distributors of San Bernardino county has developed until it is one of the largest marketing agencies of this section, the past year shipping 1700 cars of oranges and distributing to the growers throughout the various packing associations a total of $1,500,000. These figures were the principal features of reports at the annual meeting of the directors of the organization held in the main offices on East State street. There was much other interesting data in the reports, however. The organization markets for eight associations, the Mutual of Redlands; Bryn Mawr Fruit Growers and Henry Fuller & Sons of Bryn Mawr; Colton Orange Growers' Association, Highgrove Orange Growers' Association, Rialto Orange Growers' Association, Highland Fruit Association and East Highlands Citrus Association. The output of the eight associations has steadily increased and this year the total was only a few cars under the total of last year, while the total crop was much less.

THE SEASON OPENS EARLY.

Orange picking began in the Success orchards in the Porterville district October 13. Within the week, packing will be on in full swing in the various houses. Some of the exceptionally early fruit has already been shipped. October 13 there was consigned to a Los Angeles fruit firm twenty boxes of early navels, which will strike the southern markets at a time when the Valencia crop is almost entirely cleaned up.

This year there will be six packing houses in operation, in addition to the Comet Association, Strathmore Association, two Zante Association and Plano Association houses, all of which are properly within the Porterville district. It is estimated generally that the entire output of the year will be fully 30 per cent in excess of the shipments of last year, which will mean not far from 3500 cars.

Fruit is especially sweet this year, of more than average quality, and what is most encouraging of all, not more than 10 per cent of the oranges are showing thrips marks. The injury to grade from this pest will this year be negligible.

Let us foster this inherent impulse that finds its best expression in the betterment of things around us—that leads the true lover of nature to turn instinctively to tne cultivation of the soil, to the care and development of our gardens and flowers, and thus do our full duty toward beautifying our community and adding to the value and attractiveness of our home.

Tree and Shrub Fruits

PRUNING PEACH TREES IN ROGUE RIVER VALLEY.

The proper pruning of the peach begins at planting time. Cut back the stem of your young trees to as near a uniform height as possible, taking care always to see that plenty of live buds are left for sprouts. Upon examination some buds will probably be found to be blind and others injured in transit, and so, to insure the growth of a sufficient number of sprouts, always leave from two to six small twigs (cut about three inches long) on the stem, even if higher than your standard set for branches. By watching these trees during the first summer's growth, they may often be lowered by cutting out the top of those where lower buds have been induced to grow, by reason of the start being given the tree from the higher sprouts. The pruning which may be given the tree during its first spring and summer I regard as of most importance, until the tree becomes of full bearing age. All dead and surplus twigs should be cut off during the first spring and summer. From three to five sprouts coming out at different places on the trunk will be sufficient to form the body of the tree.

Having passed the first summer, the following spring's pruning will consist mostly of heading back or shortening in these sprouts left for the body. The second spring's pruning will be practically a repetition of the first, save the cutting out of a few limbs that appear to be undesirable. Quite a few limbs and twigs may be left at this pruning, which in future prunings should be taken off. I refer mostly to the small limbs and twigs which are close to the ground, which, if allowed to grow another season, would begin to bother considerably in cultivating, yet will produce the best of peaches for the present season. At this age they are generally spoken of as three-year-olds, and will produce their first crop.

The following season, or at four years of age, your trees should be practically in full bearing and the tree should be opened up some; that is, some of the center limbs taken out that the sunlight and air may enter, and thereby prevent smothering of buds and twigs all through the center of the tree. With this year's pruning comes the necessity of much thought and study, as each grower should work out the best method of pruning under his own conditions of soil, etc. In general, the tree should be tipped each season and branches thinned out, so as to allow plenty of sunlight and air through the entire tree and to keep the limbs shortened in. The tendency of the peach is to produce its fruit on the tips of the limbs and only on last season's wood growth; so, without tipping back, the limbs soon become long and slender, with the fruit only at the extreme end, resulting in a poorer quality of fruit and a less thrifty tree; in fact, it is this treatment that is responsible for the belief that the peach is of short life. Given proper care and pruning, a peach tree in Rogue River Valley will remain vigorous and productive a life-time.

I consider any time here during the dormant season a good time to prune, as I have never seen any injury from so doing in the past twenty years. The spring is the most natural time, however, and the earlier in the spring the work is done the more vigorous the next season's wood growth, and the later the less wood growth. My experiments have led me to believe that pruning after the fruit is set will be practical, inasmuch as the tree seems to suffer no injury and makes a sufficient growth. You have the advantage of pruning for a crop, should a large per cent of the buds be defective from disease or killed by frost. I cannot agree with some summer pruning enthusiasts, however, as my experiments lead me to believe the pruning should not be left till too close to the pit-forming stage of the fruit, as the wood and bud growth for next season will prove unsatisfactory.

My method of pruning a bearing peach tree is as follows: Having carefully looked over the tree, proceed to cut out all large limbs thought undesirable, then single out a limb and follow up with your eye, from base of limb to a point as low on the main limb as is possible to make a cut, yet leave a sufficient number of bearing sprouts for crop; considering at the same time all the other limbs, so you may have a tree of even height. Next, thin out twigs and clip all that are over eight to twelve inches in length, being careful to leave sufficient fruit buds, as this is where you get the fruit. In thinning out the twigs, aim to occupy as much space as possible without leaving two twigs together.

By this method you have seemingly cut out the best and most vigorous limbs at the top, yet I fail to see any harm in so doing, as the entire strength of the tree immediately goes to the twigs left, with the result of proper development. By this system the tree, after reaching the age of six or eight years, may be kept at the same height, excepting when the trees are planted on extra heavy land, which is not the best for peaches. The two main points in the production of high-grade peaches are those of pruning and thinning. By due consideration of these, we put vigor into the tree, and instead of a slender-limbed, half-dead tree we have a stocky, dark-leafed tree that will live seemingly forever.—Rogue River Fruit Grower.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

ONCE AGAIN.

By Mrs. M. E. Sherman.

The question of tuberculosis was recently considered in these columns but it does not readily take hold of the dairyman's understanding. I have now several letters on the subject to answer as well as the discussion of the matter as taken up at the Tulare Grange. The idea of loss of the cows by having them destroyed by the authorities seems to be in the mind rather than anything else. While the dairyman that has this disease in his herd is unfortunate, still it can hardly be made a matter of public payments as the cow industry is not great enough in wealth to make it a political object to give us a subsidy for the cows destroyed. The proper way to look at this matter is that a cow afflicted is worthless and if left in the herd is a source of infection to the others. The only way to save the herd is to promptly remove anything that is shown by the tuberculin test to be diseased.

Disease of Filth.

The idea that tuberculosis is an act of God must be abandoned. It is a disease of filth and overcrowded conditions of stables. Now to stamp it out of a herd. As a comparison let us consider the bacillus as a weed seed. Any farmer knows that if he destroys the weeds before they perfect seeds, that next year vineyards and orchards will have fewer to remove, and if this clean cultivation is kept up year after year, in time all will be removed. The same thing happens in the dairy herd. Year after year the cows are tested until all those infected are removed and the herd is free. It cannot enter a herd unless introduced by a diseased animal.

Testing.

The California dairyman is not standing by himself in this matter, for one after another the different states are refusing to allow animals to be shipped into them without certificates of tuberculin test. We shipped a second young sire to the U. S. Government last week and he had to be tested before he could go into New Mexico. One copy of this certificate made by a state officer must be sent to Sacramento, one to Secretary of the Cattle Commission of New Mexico, one to the purchaser, and the fourth is retained by the seller. All this work, beside the testing, cost the sum of five dollars. This cost is higher than usual but the seller is supposed to consider it in the sale of the animal.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Aid of University.

The University stands ready to aid the dairymen in stamping out this disease. Whenever a group of men desire to take the matter up the University will send an instructor to show them how to test the cows by practically doing the work. In turn this group of men are expected to show others how the test is applied. The temperature charts are filled and turned over to the University by the dairymen for reading whenever they test their animals. These charts are filed and kept as memoranda for future reference. The testing does not affect the cows more than having strangers around them. A herd used to receiving guests in the stables will not drop in their milk while those unused to the social whirl may be made nervous and fall off a little bit.

Prices of Butter Fat.

The extremely high prices of butterfat make this a good time to test the cows as the loss of a few will not push the creamery check away down below the point of profit. The present high prices are bringing a rush of people into the dairy business that have not studied the matter at all. I look to see many going broke at the prices they are now paying for worthless cows—$60.00 to $75.00 for cows that will not pay for the milking is the going price. Then there is the cheap buyer in the market thinking he can make a profit out of culls. I heard of a case where a man bought Jersey grades for thirty dollars a head. As the prices were less than the animals would bring as beef it arouses suspicion that there might be worse trouble behind.

Abuses of Tuberculin Test.

Tuberculin has been abused in this way: If an animal is to be tested, it may be given a shot of tuberculin before the testing, when the results will be negative for some months' times. When a herd is in the hands of a dishonest man and he thinks they are diseased, he can inject the tuberculin without taking the temperature before or after and then can say he does not know that they will react. If the purchaser chances to test them they pass all right. One of the Eastern states tried paying for the cattle that were too badly diseased to be used for beef. The jobbers made money by sending in diseased cows for the state to buy from the adjoining states. While confidence is said to be the basis of all business, it is not always well to be too confiding. There is good in everything. As the old lady observed, if we give even the devil his due, we must admit he is very industrious in the many ways he shows people to chase the nimble dollars as they flit.—M. E. Sherman.

JERSEYS AS DAIRY COWS.

By Geo. A. Smith, Corcoran.

In the great public competitive dairy tests at the Chicago and St. Louis World's Fairs the Jerseys proved the most economical producers of all dairy products. It should be noticed that the above covers all dairy products, including butter, cheese, and milk for all purposes. The awards at these two great Worlds Fairs show that the Jerseys won all the principal honors competed for in the demonstration. As a herd the Jerseys lead all others. In the dairy test at St. Louis the cow that returned a pound of butterfat for the smallest amount of nutriment was a Jersey and she was followed by 13 other Jerseys before a cow of any other breed secured a place. The highest rank attained by a Holstein was number 15. The fact that only one Jersey appears in the last half of the list shows that the breed stands pre-eminently first on the score of economy of production.

The Jersey breed now has 30 cows that have produced enough butter to entitle them to a place in the 700 pound list. Many other Jersey breeders are conducting year's authenticated tests in their herds and some of their cows will qualify for this list. Over 550 Jerseys, including heifers and cows of all ages have finished a year's authenticated work and have made an average butter yield of 508 pounds of butter each. The mature cows, five years old and over, made an average butter yield of 602 pounds each. This certainly proves that the Jersey cow is "the little giant of the dairy." Only a few years ago the dairy papers of the country were lauding the 300 pound dairy cow as the acme of perfection, and many dairies today are still under that amount and need a good Jersey sire to start them up toward the 400 or 500 pounds mark.

Here in California many dairymen have held to the stubborn belief in a dual-purpose cow, an animal that can be either used for beef or dairying, but not especially adapted to either. They are now beginning to realize that the Jersey is a special dairy-purpose cow of the highest usefulness and profit. She is slowly but surely winning her way, by her intrinsic value as a butter producer, into many of the best herds of the state. At the recent California State Fair, the Jerseys won all the awards in the Five Day Butter Contest with 17 cows competing, consisting of Jerseys, Holsteins, and Dutch Belted.

The Jersey breeders do not believe in seven-day and thirty-day records as they are not indicative of what a cow will do in a year. At the present time 55 Jersey cows are under a year's authenticated test under the supervision of the State University and are the only cows of any breed that are undergoing a year's test in this state. The Jersey breeders of this state are not ashamed to show what their cows can do in a year. The Jersey is not a cow that makes a great spurt on the start nor one that makes such phenomenal seven-day records, but she is very persistent and great at sticking to her work the year round, and when she completes her year's work she is ahead of all breeds, as is shown by the above figures, and sets a pace that is very hard to keep up with. A small yield each day is often overbalanced by persistent lactation and uniformity of production. A small quantity of rich milk frequently pays better than a much larger quantity of poor milk. The Jersey is the largest milker in proportion to her live weight.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

98% of the World's Creameries Use
DE LAVAL
Cream Separators

Ten years ago there were a dozen different makes of creamery or factory separators in use. Today over 98 per cent of the world's creameries use DE LAVAL separators exclusively.

It means a difference of several thousand dollars a year whether a DE LAVAL or some other make of separator is used in a creamery.

Exactly the same differences exist, on a smaller scale, in the use of FARM separators. But the farm user doesn't know it. Nine times out of ten he can't tell when he is wasting $50 or $100 a year in quantity and quality of product through the use of an inferior separator.

There can be no better recommendation for the DE LAVAL than the fact that the men who make the separation of milk a business use the DE LAVAL to the practical excluson of all other separators.

AGGRESSIVE PLANTS.

It seems to me that we too often err on the side of making phenomena more simple than they really are. Plants are vastly more complex organisms than our formulated ideas recognize. Many of their phenomena completely baffled us. For example, I might mention what has been called aggressiveness in a plant, namely, its ability not only to occupy and maintain the soil but to spread and crowd out other plants. This is particularly evident in plants introduced from one country into another. Thus nearly all our weeds are of old world origin. The same is true of our permanent meadow and pasture plants, where ability to occupy and hold the ground against weeds is essential. In this respect our American grasses and clovers utterly fail before the foreign immigrant. Some other striking instances of the great aggressiveness of an immigrant may be cited. The introduced English violet is said to be one of the worst weeds in Mauritius; American cacti are becoming a pest in South Africa; the marvelous vigor and spread of the American water weed (Elodea) under European conditions is well known.

Several explanations of these and other phenomena have been advanced. The commonest one is that the plant is introduced but its fungous and insect enemies are not. Therefore the plant is released from all handicaps as it were and can exercise to the utmost its inherent energy. A second and related explanation is that every plant becomes held within limits by the competition of other plants in its native land and very often in the new environment the native plants do not have an equal restraining influence—because they have had to contend with a different set of competitors. A third idea is that an organism with the ability to spread at all becomes more energetic through the constant mixing of blood of the advancing population. All these ideas are interesting, but difficult if not impossible of experimental proof. The last suggestion receives some support from the fact that many weeds and other organisms run out after they have ceased to spread. The recent examples of the Russian thistle and the prickly lettuce are familiar cases. Such phenomena may be due wholly or in part to increase in enemies, but in many cases like the two cited there is not one iota of positive evidence. I think we ought to give such phenomena more consideration as they reveal traits in plants that transcend all our stereotyped and inadequate theories. The old gardener often treats his plants as if he regarded them as sentient beings. Perhaps we err in considering them too much as machines.—C. V. Piper in Science.

NASTURTIUMS.

For ease of culture, duration of bloom, brilliancy of coloring and general excellence nothing excels Nasturtiums. All they need is a moderately good soil in a well drained, sunny position, and from within a few weeks of the time they are sown until hard frost comes there is an endless profusion of their gorgeous blossoms.

The introduction of the Toy-leaved varieties has brought in a new class of compact, climbing habit, growing about six to eight feet high, with thick green-lobed leaves resembling those of the English Ivy. The flowers, which are borne in greatest abundance throughout the season, are of medium size and peculiarly cut and fringed, giving them an airy butterfly effect; very desirable for training over trellis, rockwork, vases, etc.

Nasturtiums are considered as hardy annuals, hence may be planted in the fall months or when the first rains set in. Do not cover the seeds too deep. A good rule is to cover each seed its own depth with soil, at the same time taking care to water carefully. Never water so much that the soil becomes saturated; nor even let the top get dry. Most varieties will germinate within ten days. Annuals may also be sown at any time during the spring months for summer blooming, care being taken to shade the young plants after transplanting, in hot weather.

"Now I am a lover of the old-fashioned flowers. For several reasons: They are as beautiful as any of the modern ones—many of them much more so. They require a small amount of care. They bloom freely, most of them profusely and some of them throughout the season. And, too, they can always be depended upon to do well under such conditions as prevail in the average garden."

An old plant is the nasturtium. "Sturtions" our grandmothers used to call them. They bloom generously, and like the sweet-pea, if prevented from ripening seed.

Balsam—the "lady's slipper" of former generations—is deserving a place in all collections. It blooms profusely, comes in a wide range of color and is easily grown. In order to give the flowers a chance to display their charms effectively, it may be necessary to clip off a good many of the leaves along the main stalks. The balsams of your grandmother's time were single flowers, but those of our day are as double as a rose. The flowers cluster so thickly along the stalk that they look like broken bits of wreathing.

ALMOND GROWING IN PALESTINE.

From a report just received from Consul Thomas R. Wallace at Jerusalem, we learn that the almond is being planted extensively in the plain near Jaffa. The soil and climate are favorable for its production, and it con be grown with little expense. It is taking the place of the wine and olive, yielding more profitable returns and requiring less care in cultivation. The almond orchards are just coming into bearing and the results have been quite satisfactory to the growers. The yield for 1909 was 300 tons, valued at $38,600, the product being exported to France and Italy. The successful cultivation of this crop has encouraged the planting of large areas and it promises in time to become one of the leading profitable industries of the planters near Jaffa.

The Ninth Annual Convention of the National Nut-Growers' Association will be held at Monticello, Florida, November 1st, 2nd and 3rd, 1910.

Garden and Field Crops

HOW TO RAISE PEANUTS.

By Prof. J. E. Waggoner, I. H. C. Service Bureau, International Harvester Company of America.

There is perhaps no other nut so generally known and so universally used as is the peanut. To within the past few years its principal sale was to vendors and in confectionery stores. Wherever a few people were gathered together some ambitious boy filled the air with the cry "Fresh roasted peanuts." But now men have found other uses for it, as an oil producer, for stock food, and as a soil redeemer. About forty per cent. of the berry is oil; it will produce more pork, acre for acre, when used as pasture in connection with corn than cowpeas, rape, sweet potatoes, or sorghum and restores nitrogen to the soil as do other leguminous crops.

Most seed companies list but two varieties, the large white kind, Virginia white, Virginia red, and Tennessee white, Tennessee red, which are used largely for human food. The other variety known as Spanish Peanuts are used principally for stock feeding purposes. They are smaller than the white species. The uses of these varieties are not confined as stated above, but may be interchanged. As a rule the Spanish peanut is a surer and heavier fruiter than the others, and is not as particular about the condition of the soil. A bushel of Spanish peanuts weighs twenty pounds while the white ones weigh twenty-two pounds.

The greatest degree of success in peanut growing is reached in a light sandy soil, not overly high in vegetable matter, not necessarily high in nitrogen content, for the peanut gathers most of its nitrogen from the air, well drained, and containing a medium amount of lime. The lime will make the ground friable, supply the calcium, and give the peanuts a light color, which for a commercial product is a very important consideration. If the soil is lacking in lime it may be supplied at the rate of 1000 lbs. to the acre with remarkable results.

This crop requires about the same preparation of soil as do corn, cotton and oats. Plowed flat to a depth of five to seven inches and thoroughly harrowed will put the seed bed in splendid condition.

The fertilizer to be used depends on the soil, but as the peanut is of the legume family it does not require a nitrogen fertilizer. In some cases, however, a highly nitrogenous fertilizer gives a slight increase in hay production but not in pods. Where it is found necessary to fertilize, the best results have been obtained by using a fertilizer distributer just before planting the nuts.

The large nuts may be hulled and dropped by a corn or cotton planter or by hand to suit the convenience of the planter. At the McNeil Experiment Station, Mississippi and Spanish nuts were soaked from 36 to 48 hours, then dropped by hand in rows 2½ to 3 feet apart, 10 to 12 inches in the row and covered from one to two inches deep. To prevent a crust forming before the plant appears it is best to keep soil stirred with a light smoothing or weeding harrow. The Osborne Peg Tooth Harrow gives splendid satisfaction when used in this connection. The plant when small is brittle and will not permit harrowing.

The cultivation is practically the same as for corn and cotton. The soil should be stirred to prevent baking, but deep cultivation near the plant is apt to prove injurious except when it is very small. Surface cultivation gives the best results if the soil has been well prepared. The practice of covering plant with dirt during fruiting season is not only expensive but has been found to be injurious to the plant.

The little Spanish nuts may be harvested by pulling, but with the large white varieties it is best to plow them out, then follow behind, shake off the dirt and turn nuts to the sun. After drying for five or six hours they should be piled in small cocks with the vines on the outside. After allowing to cure partly in small piles they should be stacked. A pole stack with some brush to keep vines off the ground and with some heavy grass to top it out has given good satisfaction. Later they should be hauled to a shed where nuts may be pulled or pounded off during bad weather, the vines then stored for hay.

If planted early it is easy to produce two crops a year. Peanuts make a very good catch crop with corn and fit well into the rotation with oats. As a soil builder peanuts come nearer equalling cowpeas than any other crop we can grow. From the standpoint of hay, peanut vines surpass timothy and equal clover.

The yield of peanuts varies from 30 to 150 bushels per acre, and as a rule can be marketed for from $1.25 to $1.50 per bushel. The Spanish variety is the best and surest crop. An ordinary yield of Spanish nuts at the McNeil Experiment Station, Mississippi, has been 1640 pounds peanuts and 2452 pounds hay per acre, while with the white kind a single result gave 1792 pounds nuts and 3520 pounds of hay. The white variety selects its soil with more care than does the other, and often if conditions are not right, fifty per cent of the pods will be empty.

SPINELESS CACTUS DISTRIBUTION.

The United States Department of Agriculture will distribute in the spring of 1911 about ten tons of spineless prickly pear cuttings. The stock is grown mainly at Chico, California, and at Brownsville, Texas. Out of 30 varieties which the department has grown in the past, eight or ten are now being propagated for distribution to those who may wish to test them as an economic crop. These plants will not succeed outside of California, the coastal region of Florida, Texas south of the Texas-Mexican Railway, and southern Arizona. These will not succeed where the temperature remains below 20° F. for any length of time.

All applications should be made to the Office of Farm Management, U. S. Department of Agriculture, Washington, D. C., before the first of January, 1911.

SPECIAL NOTICE TO MELON GROWERS

Plant your cover crop now and double your yield of melons. Sow

Vetch, Fenugreek, Canadian Field Peas, Burr Clover

If you are in the market for any of the above for cover crop, write us for prices, stating quantity, and we will make you close prices.

We also have several tons of small Yorkshire Hero peas that we screened out of our seed stock which we are offering at $3.00 per cwt. If you would sow them in your orchard you could harvest a crop of green peas and get a fancy price in the San Francisco market and also fertilize the orchard.

Now is the time to plant onion and cabbage seed. We can furnish them in any quantity.

Aggeler & Musser Seed Company
113-115 N. Main St. Los Angeles, California

STRAWBERRY PLANTS

My plants are grown in Tropico and on land never before used for Strawberry Culture. Plants are selected by myself for breeding and the blossoms always picked, therefore the strength grows into new plants. This is why my stock will produce by far the greatest amount of berries. If you are going to set out 100 or 500,000 be sure and write to

MIDWINTER TOMATO IN CALIFORNIA, Cover.

FARMERS WEEK AT UNIVERSITY FARM, 387.

CITRUS AND TROPICAL FRUITS.—Soil Fertility; Mutual Orange Distributors; Season Opens Early: 388, 389.

TREE AND SHRUB FRUITS.—Pruning Peach Trees in Rogue River Valley: 390, 391.

LIVE STOCK AND DAIRY.—Once Again; Jerseys as Dairy Cows: 392, 393.

ORNAMENTAL GARDEN.—Aggressive Plants; Nasturtiums; Almond Growing in Palestine: 394.

GARDEN AND FIELD CROPS.—How to Raise Peanuts; Spineless Cactus Distribution: 395.

EDITORIAL.—Next Week; Eastern Expert's Opinion; Commercial Fertilizers; Dry Farming; Country Life Commission; Farmers Institutes; Clubbing Orders: 396.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast: 397.

PRACTICAL POULTRY CULTURE.—Care of Pekin Ducks; Balanced Ration: 398, 399.

QUERIES AND REPLIES.—Eradicating Squirrels; Planting Umbrella Trees; Sorts of Citrus Fruits; Ailing Palms; Alfalfa Meal; Grape and Apple Vinegar; Hogs and Alfalfa; Potatoes Not Blooming; Grafting Black Walnuts; Green Manuring; White Rabbits; White Scale; Arabian Alfalfa: 400, 401, 402.

HOUSEHOLD.—The Wolf at the Door; Getting Ready to Go; Meat Pies and Similar Dishes: 404, 405.

PRODUCE MARKET.—Los Angeles Market, San Francisco Market; Deciduous Market, Citrus Market: 406, 407.

Next Week

The next issue of the California Cultivator will be of special value and well worth preservation, especially by those who may have occasion to fight insect or fungous pests. As there are but few agriculturists not compelled to do that, we assume that paper will be of general interest. The feature is a spray calendar—we were about to say "complete spray calendar"—but it is impossible to prepare a complete calendar which will be complete tomorrow. However, this one will contain formulas for practically all the better fungicides and insecticides. And pests affecting various fruits, with common and scientific name will be given and proper formula for each pest referred to by number. The article will fill some seventeen columns so that some of the regular departments will be crowded out. It is well worth the additional space and we mention that fact this week that the number may be looked for and preserved when issued.

An Eastern Expert's Opinion

On his way home from acting as presiding judge at the Watsonville apple show, Mr. Geo. E. Rowe of Grand Rapids, Mich., called at the Cultivator office and at our request gave the following estimate of the apple annual and of the California fruit growing industry. Mr. Rowe has judged many eastern horticultural events, which makes his opinion of exceptional value.

"The California Apple Annual held at Watsonville in many ways was the most remarkable exhibit of fruit ever put up in the world. At the World's Fair in Chicago and the Pan-American Exposition there was never more than a single carload of apples on exhibition at one time. At the National Apple Show at Spokane last year there were something less than thirteen carloads on exhibition, while at Watsonville this year there were over 36 carloads of 600 boxes each, making 21,000 bushels, or not far from 3,000,000 individual apples. If laid out in a single line, the belt would be equal to 206 miles of apples.

"Aside from the magnitude of this exhibit and its relative showing to other exhibits of fruit, it was equal to anything ever exhibited for quality, the commercial pack by carload lots scoring as high as single plates of fruit at the average state fair.

"California has been known as a mineral state and as a citrus fruit state, but up to the present time but very little has been known of her great apple industry, and while apples are not grown all over the entire state, there are a few valleys and a large portion of the foothills that respond to the demands of the apple orchard and give the very best results.

There are, without doubt, more apples grown in the Pajaro Valley than any other territory of the same acreage in the world. The valley is only about fifteen miles long and eight miles wide, yet its output this year will be over 5000 carloads."

Commercial Fertilizers

Bulletin No. 26 of the Agricultural Experiment Station at Berkeley, written by John S. Burd, gives results of fertilizer inspection work of the California Fertilizer Control for the year ending June 30th. The bulletin gives ingredients of various commercial fertilizers offered for sale in the state, also the chemical analysis of hundreds of different samples sent by purchasers and secured in the open market. Exact valuations are placed on each sample submitted on the basis of the schedule of trade values fixed by the experiment station. It states that it wishes it understood that in adopting this schedule it is not assuming to dictate prices, but simply to form a basis upon which the true valuation may be determined according to the market values of the elements purchased.

This schedule fixes the following prices per pound for phosphoric acid: available (water and citrate-soluble) 6 cents; insoluble in mixed fertilizers 2½ cents; in fine bone and tankage 4½ cents; in medium bone and tankage 3½ cents; in fine Thomas phosphate powder 5 cents; in medium Thomas phosphate powder 3 cents. For nitrogen: in ammonia salts 18 cents; in nitrates 17½ cents; organic form in blood 21 cents, in mixed fertilizers 20 cents, in fine bone and tankage 20½ cents, in medium bone and tankage 16 cents. For potash: from sulphate 6 cents; from muriate 5 cents.

This bulletin will be invaluable in the hands of the intelligent orchardist.

Dry Farming

Over 1200 delegates representing 250 million acres of dry land in the United States and a total of 5 billion acres throughout the world, and believers in dry farming generally feel that a more enlightened handling of dry farming operations received great impetus through the congress recently adjourned at Spokane. The problems discussed were conservation of moisture, desire for knowledge in farming both from a practical and a theoretical standpoint, and the general uplift of humanity through lessening the burden of the struggling and oppressed through improving farm life, education, restoration of waste places, and reclamation of "bad lands," also the necessity for federal aid and cooperation in conquering the forces of nature. Perhaps the keynote of the convention was education.

One action taken looks to the end of an endowment fund of a half million dollars, the interest to be used in the extension of scientific and experimental work.

The International Dry Farming Exposition was a great feature of the Congress. America took second place, with Alberta, Canada, carrying off the chief prizes. Colorado Springs was chosen as the place of meeting for 1911 with Alberta making a strong advance bid for the meeting of 1912. The president elected for the coming year is J. H. Worst of the North Dakota Agricultural College. John T. Burns was re-elected secretary-treasurer. His headquarters will be established at Colorado Springs in December.

Country Life Commission

Country Life was recognized at the Farmers Week program at Davis by giving one entire day to discussing its problems from the social and educational standpoint. It must be admitted that the question of the almighty dollar continually crept in. Some speakers deprecated this and argued that the farmer should be above considering finance during the discussion of matters which mean so much to the youth. But one or two hard-headed farmers, not so old either, maintained that if the question of dollars were ignored, ranch life would soon cease to be attractive to the young people. Farm life must be profitable to be attractive and to secure for those who follow it the comforts and privileges which city people have.

One result of the conference was a resolution unanimously adopted that there should be undertaken an effort to develop the full possibilities of country life in California. The question of public schools, especially those in rural districts, should be made the subject of state wide discussion. To attain this end the chairman was requested to appoint a committee whose duty should be to canvass the field, and if deemed advisable, call for a state conference of farmers and educators and others interested in country life to consider this educational problem.

Touching upon the education of the youth of the rural districts, one speaker emphatically stated that young people should not be brought up with the idea that a liberal education aided in escaping hard work. He said that too often youngsters were started to school with the idea that they were to secure sufficient knowledge to escape the drudgery which their less fortunate companions had to undergo, and following out this idea, they made complete failures of their lives. Education only gives opportunity for greater labor and greater accomplishment.

Farmers Institutes

J. B. Neff in charge of Farmers Institutes for Southern California announces one-day institutes in San Luis Obispo county at Templeton, November 18, and Paso Robles November 19. Arrangements are perfecting for others at Beaumont, Banning and Thermal probably near the end of November. The week of December 12 to 17 will be given to Imperial Valley. Information as to towns and dates will be given in the Cultivator as soon as definitely planned.

Clubbing Orders

For the information of our many readers who desire to order their year's list of magazines through us, we wish to announce the early publication of our catalog. From the numerous inquiries already received, we realize that this annual feature is looked forward to with appreciation by our subscribers. We have plans for a very attractive list of offers this season at the usual attractive prices, and space will be given in our pages for this list as soon as possible. We trust that those interested will wait its appearance and favor us with an early order, as we anticipate a very large season's business.

Walnut gathering is proceeding satisfactorily in all walnut growing sections of the state. Definite statement as to the output cannot be given as yet, but it is certain that the damage from blight is more serious than earlier anticipated. The output is being picked up at exceptionally high prices, and the returns, even with the shorter crop, will be exceptional.

The Ninth Annual Convention of the National Nut-Growers' Association will be held at Monticello, Florida, November 1st, 2nd and 3d, 1910.

Agricultural News Notes of the Pacific Coast

Northern California

Pomona Grange of Sonoma county met at Santa Rosa on Wednesday of last week.

There are 19,000 acres of grapes, and 3200 acres planted to Bartlett pears in Sacramento county.

Clarence Griffith of Lomo, Sutter county, recently sold four hogs which brought him $82.45, over $20 each.

Too great heat in evaporating apples caused the burning of the MacDonald apple drier at Santa Rosa last week.

Sonoma county had another serious forest fire last week and it was with difficulty that the big bridge near Laguna was saved.

This season growers at various points in the Stockton delta lands expect to ship to Eastern markets fully 300 carloads of celery.

Vacaville, Solano county, has shipped 1015 cars of fruit since the opening of the season. To same date last year the total shipments were 989.

The big fruit dryer at the John Valentine place at Molino in Sonoma was destroyed by fire on Otcober 12 and a large quantity of fruit was also consumed.

Announcement was received from State Horticultural Commissioner J. W. Jeffrey that the State Fruit Growers' Association convention would be held in Stockton during the first week in December.

The Napa branch of the Farmers' Union is going to hold a series of open meetings during the fall and winter and invites the general public and especially those interested in agriculture to attend.

Nine hundred acres of land in Glenn county have been sold to a company of men from an Eastern state who will plant the same to Smyrna figs. Work has already been begun on the project.

The 180-acre vineyard of the Schuler Vineyard Company, located near Lodi and through which the Traction Interurban line passes, will this year yield 15,000 crates of table grapes and forty cars of wine grapes.

The prices paid by Humboldt county's creameries for deliveries up to the 15th were: Capital 37 cents, Central 37 cents, Libby, McNeil & Libby 36¼ cents, Grizzly Bluff 36 cents, Swift & Co. 36¼ cents, Sunset 36½.

Unprecedented prices are now being offered for Humboldt county apples, particularly for the product from the Mattole section. The entire crop of the Etter orchard comprising several thousand boxes, has been sold at $2.25 per box.

Nearly 20,000 almond trees are to be planted on Butte county lands this year, the farmers hereabouts having at last come to the realization that the soil in this vicinity is unexcelled for such a crop.

Seven dollars and ten cents per box for Valencias was the price received by the Stewart Fruit Company for a consignment sold in New York early in the week. It is claimed by their Porterville manager that this is the season record.

Central California

Porterville started her packing houses on navels October 24th.

The total attendance at the Apple Annual at Watsonville was 30,000.

Grape growers near Stockton plan the erection of a co-operative winery.

The fifth annual Tulare County Citrus Fair will be held in Visalia December 5-10.

A sardine cannery at Monterey recently packed 90,000 cans of sardines in twelve hours.

The Hollister Storage Company recently shipped ten cars of red oat hay to Portland, Oregon.

Exeter claims honor for the first shipment of oranges on October 18th from Central California.

A locoed cow became wild on the streets of Madera last week and caused great excitement before subdued.

An electric railway from Stockton to Modesto is building through Ripon and the graders are within four miles of town.

The students of the Porterville high school are engaged in planting wheat and other crops in the school gardens.

An interesting farmers' institute was held in Kerman last Saturday, farmers from a long distance attending and bringing basket lunches.

Ripon, San Joaquin county, is looking to the future as contracts have been signed for a system of irrigation which will water 71,000 acres of land.

The Kerman high school begins an agricultural course with a series of lectures by Prof. Kauffman, formerly professor of dairying, North Dakota Agricultural College.

On October 20, N. B. Reed of Fresno purchased a fine ranch of thirteen acres in the Cotati rancho. Mr. Reed intends to go into the poultry business on a large scale.

Pomona grange, consisting of the Visalia, Tulare, Orosi and Dinuba granges, will meet in Visalia on October 29. An interesting program is being arranged for the event.

Stockton is making preparations for the entertainment of the attendants at the State Fruit Growers' Convention to be held in that city the first week in December.

Practically every packing house in Porterville is in operation, or about to be, on the present citrus fruit crop. All estimates of the total tonnage of the crop this year place it at twenty-five per cent in excess of that for last season.

J. E. McAuley, and W. A. Irwin, have under way the development of what will be the largest single orange tract in California and perhaps in the world, their plans being to develop and plant out to oranges 1800 acres of Frazier valley land, in Central California, to oranges.

The Stockton Chamber of Commerce is desirous of securing signed statements from farmers of that county detailing profits derived from poultry, fruit, vegetables and other farm products raised on a given number of acres.

Southern California

The sugar campaign at Oxnard will close November 5th.

The Orange Street Fair management netted $400 for a start on next year's event.

In the El Cajon valley the raisin crop is expected to fall about 30 per cent below the normal.

A school of small rainbow trout has been planted in Strawberry Creek, San Jacinto mountains.

Los Angeles has a 17-year-old persimmon tree which has this year over 2200 fine specimens of fruit.

In the future the California Fruit Growers' exchange expects to manufacture about 2,000,000 boxes annually.

It looks as if exports from California of beans to Mexico will be cut off for the crops there will be large this year.

Lima bean threshing is proceeding rapidly and it is reported that the damage from the storm is not as great as feared.

Apple growers of Oak Glen and the Upper Yucaipa valley are marketing their crop that will bring in excess of $60,000 to this section.

Southern California's first popcorn shipment was on October 24th when a full car arrived in Los Angeles from Inglewood. It sold at 3½ cents.

The output of walnuts this season from the southern part of the state will be about 9,000 tons and will bring the growers well up towards two millions of dollars.

James G. Cortelyou, of Los Angeles, has sold his half-section ranch adjoining Imperial to D. Durkee, president of the San Dimas Lemon Growers' Association, for $42,000.

The American Beet Sugar Company pays $25,000 per year for five years for the lease of 23,000 acres of Ventura county land, 4000 acres of which are good farming land.

The directors of the Escondido county fair report that when everything is settled up the late exhibition will have just about paid for itself. Next season it is thought it will do better.

Vale & Gates unloaded near 1800 head of cattle at Beaumont, week of October 8, and drove them through to Warner's Ranch by the way of Hemet. The cattle were shipped from Arizona.

A new sugar factory is to be built in Orange county. It will be located in the vicinity of Huntington Beach. This factory with the one to be built at Anaheim will make the fourth sugar factory for Orange county.

The prize winning pumpkin at the late Escondido fair weighed 103¼ pounds and measures six feet eight inches in circumference. The total weight of twelve, which were all grown on the same vine, is 600 pounds.

The Santa Barbara Press says that in the reports on the walnut crop this year the nine-year-old, 15-acre grove of Stephen Rutherford, of Naples, will probably win the prize for productiveness. It produced 10 tons, equalling 50 pounds to the tree.

The Coast

The Fair Oaks orchard, near Prescott, Arizona, produced 18,000 boxes of apples this year.

The average yield of wheat in Walla Walla (Wash.) county this season was 18½ bushels to the acre.

The Boise, Payette and Weiser valleys in Idaho shipped out over $1,000,000 worth of prunes this season.

With sufficient moisture in the soil to enable farmers to seed and plow, fall work on the ranches of Columbia county, Washington, is in full swing.

Farmers in the neighborhood of La Mesa, New Mexico, are making preparations for the planting of their fall wheat crop. Quail will be plentiful in this vicinity this fall. Doves also are numerous.

The sale of 5140 cows and two carloads of calves from an Old Mexico rancho lying partly in Arizona, near Douglas, in Kansas City last week, is the largest occurring in that market this year. Price $3.05.

Victor Hyslop, winner of the grain judging contest at Spokane Interstate Fair, has been selected by the bureau of seed inspection of the United States department of agriculture for a position during the coming summer.

From 70 stands Geo. A. Cressy has taken nearly 6000 pounds of strained honey of the best quality. He says that he can ship to eastern markets from Hermiston, Ore., and make more money from a stand than he could within a few miles of his market.

The apple orchard at Cloverland owned by Florence Brothers of Asotin has been purchased by Spokane men. The orchard contains 75 acres of bearing trees and the price paid was $30,000. It is estimated that 20,000 boxes of apples of winter varieties will be marketed.

More than 1000 cars of apples will be shipped from the Payette valley in Idaho this year, according to figures given out at Payette. The largest fruit crop ever known in the valley is being harvested. The price of the better varieties is ranging from $1.25 to $1.75 a box.

Legumes play an important part in the dietary of the common people of Spain and the production is never equal to the demand. In 1908, the last year for which complete statistics are available, the importation of chick peas, called "garbanzos," amounted to $1,358,391, of which 10,369 tons, valued at $1,000,536, came from Mexico. At this price of a little over 4 cents per pound, it would seem that chick peas could be grown profitably in the United States for this market.

Ranchers, business men and educators from various parts of the Northwestern and Pacific states will meet in Spokane on November 17, to discuss plans prepared by the Country Life Commission of Washington for the establishment of redistricted rural schools and community centers. This is the initial step of a nation-wide movement, co-operative with the state departments of education, to teach the fundamental principles of agricultural and domestic economy and manual and industrial training.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Practical Poultry Culture

PROPER CARE OF PEKIN DUCKS.

While duck raising is very profitable when thoroughly understood, the chances are that the beginner who starts in by guess, will be a "quitter" at the end of the first season.

The Pekins are large and fine in appearance, being nearly as large when fully developed as the old-time gray goose. These are known as the Mammoth Imperial Pekins.

They are large feeders, and while young grow faster than any other domestic fowl, with the possible exception of a gosling.

When properly fed, a Pekin duckling will weigh from five to seven pounds when twelve weeks old. The best time to market young ducks is when they are anywhere from ten to fourteen weeks old. After this they gain in weight less rapidly.

When buying stock ducks, get the best birds you can find, regardless of price. If possible, buy your ducks of someone in your own locality, providing this can be done without getting birds that are closely related.

It is not a very good plan to have ducks shipped from a distance, because they cannot endure close confinement without suffering. A duck loses weight very rapidly while being shipped.

A Pekin duck responds readily to good treatment. They appreciate plenty of food and comfortable quarters, but they should not be fed or housed with chickens, nor in fact, with any other fowls, for they are very timid creatures and should be kept as quiet as possible.

Besides this, it is not advisable to feed ducks with other poultry.

A ration that is all right for ducks may be all wrong for chickens, and vice versa. For instance; whole grain is not as good for ducks as a mixture of ground grains and cooked vegetables.

Whole corn may be fed occasionally, but it should be soaked for several hours before feeding.

Dry oats and wheat make very poor duck feed, but both are good when cooked and mixed with corn-meal or boiled potatoes and bran.

It hardly pays to feed wheat to ducks unless it is unsalable. Since thorough cooking renders musty grain harmless it may be fed to ducks with good results. When cooked potatoes are used they should not be mixed with the ground grain until after the latter has been thoroughly moistened with either milk or water.

If the dry meal is added to the mashed potatoes a tough, sticky mass will be the result. Don't make the feed sloppy; just moist enough to cling together without being gummy. A duck cannot eat gummy feed without wasting it.

Other vegetables such as turnips, beets, rutabagas, etc., are sometimes used instead of potatoes. Pumpkins, when thoroughly cooked, make a very good basis for the mash. The seeds should always be removed.

When no vegetables are to be had we use equal parts of boiled oats, corn-meal, wheat bran, and middlings or second flour with a little powdered charcoal added. Salt is added to the feed twice a week. Some people (who ought to know better) put sand and oyster shell in the duck feed. When this is done the ducks are often forced to consume more grit than they require.

Of course ducks must have plenty of grit at all times, but it should not be mixed with the food. We place shallow boxes of grit close to the feed troughs. Oyster shell and coal cinders in some of the boxes, and clean, coarse sand in others.

Ducks will eat grit after every meal if it is within reach.

They usually drink and rinse their beaks while eating, therefor water should be placed near the feed troughs. Also green food is necessary the year round. Some sort of green stuff should be given at least once a day in winter.

If cabbage is plentiful, a little may be added to the mash each time. It should be chopped raw. As bulk is one of the important elements in a Pekin duck's ration, it is a good plan to provide an abundance of green stuff. We usually sow a patch of rye early in the fall for winter and early spring use.

A well-fed and properly housed Pekin duck usually lays an egg every twenty-four hours during the laying season which begins about March first, and ends about July first. During this time they will sometimes take a short rest, and will miss a day occasionally, but they seldom stop for any length of time during the laying season. The first few eggs will not hatch as a rule.

Ducks, both old and young, should have a dry, comfortable place to stay in at night. If forced to sit on the damp ground they are liable to take cramps and cold in the head. The latter is almost certain to turn to roup.

Provide suitable houses if you wish to be successful. The houses need not be very expensive, but they should be substantial so that they may be used for the same purpose several years in succession.

A board floor is better than an earth floor, because the ducks will often stir up the ground in a very disagreeable manner where there is the least sign of moisture.

Provide plenty of clean bedding, and change it frequently. Straw or litter should be kept on the floors all the time. If bedding material is plentiful put it on several inches thick. It will help to keep the ducks comfortable, and also keep the floors clean, thus serving a double purpose. Never pick ducks during the laying season.

Ducks' eggs may be hatched in incubators, but it is better to use large chicken hens when possible.

Don't keep duck eggs over a week after they are laid. The fresher they are the better they will hatch.

After a Pekin duck egg is ten days old, it is entirely worthless so far as hatching is concerned. They should be very carefully handled, as the albumen is much thinner than that of other eggs.

As soon as the eggs are laid, if not placed at once for hatching, they should be carefully wrapped in paper and turned every day. They should be kept where the temperature is neither too high nor too low—about 50 to 65 degrees F. Don't keep eggs

Poultrymen, Attention

We want to tell you what we are doing. We are erecting at the present time Yards and Pens for the largest and most up-to-date plant for fancy poultry in Southern California. We can carry on hand with our new yard about 3000 birds. We sell every standard variety, of Pullet, Cockerel, Laying Hens and Cock. We have them on hand EVERY DAY OF EVERY WEEK OF EVERY YEAR. We have been in the Hatching business for 12 years in the west. The Pioneer Hatchery has been established for several years, and from a small start is now the largest baby CHICK DEALERS IN THE ENTIRE WORLD. No order of any kind in the Poultry Line is too large for us. If you want to sell 100 or 1000 hens or more we will be glad to bid on them for spot cash.

We are shipping at present about 7500 baby chicks per week, of the Reds, Minorcas, Leghorns (White and Brown), Barred Rocks, Buff Orps., etc. Whatever you need in our line we will be glad to make a price on. If we can't sell you better poultry for less money, don't buy from us. INVESTIGATION is all WE ASK.

intended for hatching in a damp cellar.

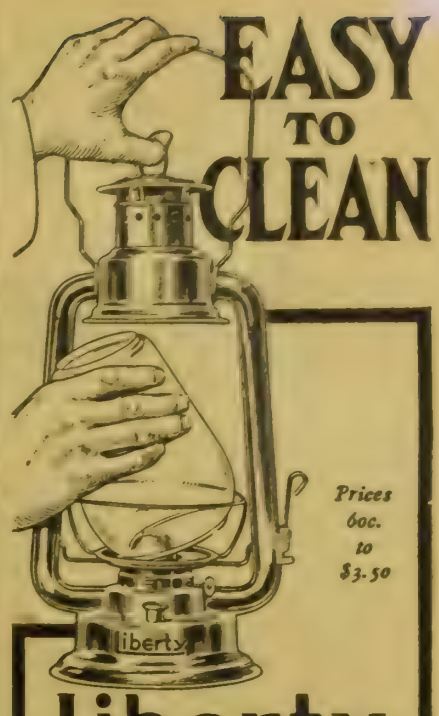
When ducks are laying, their appetite increase, but one must be careful not to overfeed. If their food is not too highly concentrated, and there is plenty of coarse grit and sand within reach, there is little danger of overfeeding. Three or four square meals a day will not hurt a laying duck. When overfed they lay double-yolked eggs.

Never give ducks buttermilk, or in fact, any other kind of milk, to drink. It may be used to moisten their feed, however. Buttermilk, skim milk and "clabber" are all valuable in duck feeding, but they should be used only for moistening the feed, and not as a drink.

Don't keep over five ducks for each drake.—Farm World.

WHAT IS A BALANCED RATION?

The question is often asked of me as to what constitutes a balanced ration. Some will say what is the need of feeding a balanced ration for if a hen is going to lay at all she will do so with ordinary feed without going to the trouble of figuring out and mixing a ration that will balance. In the first place I would say that a balanced ration is such a mixture of grains and feeds as will bring the per cent of protein in relation to a certain proportion of carbohydrates. Of course all feed as we know it, consists of protein or flesh and egg producing elements and carbohydrates or heat and fat producing elements, besides ash, water, indigestible fibre, etc. The protein and carbohydrates are the only ones that are necessary to consider in the question of a balanced ration. Most grains are too rich in carbohydrates. Thus when fed without the addition of some higher protein feed such as beef scraps, etc., we find that we are feeding too much fat producing elements and consequently our hens are liable to become too fat for the best egg production. To get the best results we find that it becomes necessary to add some beef scraps or other such protein feeds in order to bring the per cent of protein and carbohydrates in such proportion to each other as will keep the hens in the best condition for producing eggs and yet at the same time keep them from getting too fat. In order to get at this we must know the analysis of every feed that we are using and then figure out a ration that will meet our needs. Space here would not permit me to give the analysis of all the different feeds that poultry breeders use nor to give directions for figuring out rations. It of course requires quite a lot of study and figuring to arrange a good ration. If one desires to get the best possible results from his poultry, it becomes necessary for him to use every advantage for bringing his success. I believe that a balanced ration is almost a necessary part of the work. Of course good results may come by guessing at a suitable ration, but in that way there would be a chance for one to guess at something that would prove to be far from what is best. Thus if one is to feed high-priced feeds he would naturally want to feed them in proper proportions so as to get the best results. Many are keeping poultry who do not understand anything at all about a balanced ration and yet they get good results. Why? Because they have mixed their feeds so as to give their fowls a variety and in such proportions as are not too far from what we consider a perfectly proportioned ration. Others may make great mistakes in their feeding simply because they have been giving their grains and feeds far from what is correct. If we are going to go on feeding our poultry in a hit-or-miss style, what is to come of the work of our experiment stations who are working out these problems for us? If there is nothing to be gained by properly balancing up our poultry rations, then I do not understand feeding poultry. I say that I believe that the nearer we feed to a balanced ration just so may we have better chances for the best results.—Poultry Advocate.



Liberty Lanterns

The cut above tells the story—look at it. One hand lifts the "hood," the other removes the globe. Now lift the burner from its place—wipe it—slip in a new wick—rub globe and lamp free of accumulated oil and lampblack and replace parts. Now your Liberty Lantern is clean, safe, ready for business. Could anything be easier?

Liberty Lanterns give a powerful light. Every well-known and some exclusive improvements are embodied in Liberty Lanterns. Ask your dealer about them.

Malthoid Roofing

Most roofing guarantees are a joke.
Experience teaches the longer a roofing
is guaranteed to last, the poorer it is.

Manufacturers inexperienced in
making roofings—without knowledge
as to their dependability—
without responsibility as to their own
financial standing,
will very often guarantee their
roofing for any number of years
simply to get the order.

The roofing generally fails and
so does the firm that makes it
and they never live to
make good their guarantee.

Malthoid Roofing is made to make good
and while its manufacturers
guarantee it,
their guarantee is unnecessary
because the roofing in itself
is sufficient to do all that is claimed for it.

For twenty six years,
the makers of Malthoid Roofing
have made and guaranteed their roofing
and not one single purchaser can ever say
that this company has failed to
make good a guarantee.

You can depend upon the
responsibility of the makers of
Malthoid Roofing, and
you will never have to bother about
guarantees if you use Malthoid Roofing

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Eradicating Squirrels.

Please give the latest and most successful methods of killing squirrels. We have quite an extensive planting of young citrus trees on an old grain ranch and are having considerable trouble. We have killed a good many using strychnine on pieces of watermelon.—J. A. R, Corona.

Barley (whole grain) 20 pounds, strychnine sulphate (pulverized) 1 ounce, saccharine 1 teaspoon, (scant) gloss starch solution, (medium thick) 1 pint. Boil one-quarter cup of gloss starch in water to make a pint of medium thick solution. While hot, stir in the strychnine sulphate and the saccharine and mix well for several minutes. Slowly pour the poisoned starch over the grain, mixing constantly until the kernels are evenly coated with the poison. The best results are obtained by distributing the poison early in the morning or late in the afternoon.

Planting Umbrella Trees.

How far apart ought Umbrella trees to be for roadside planting? Would they be apt to blow over when they become grown? If this should be the case, could it be prevented by pruning? The location for these trees is in the Turlock district and the soil is a sandy loam.—Subscriber, Oakland.

Umbrellas in the San Joaquin Valley, where the tree luxuriates at its best, are planted from thirty to forty feet apart. If properly planted in a soil of suitable depth, there is little danger of their blowing over when once well established. Beyond trimming up to a suitable length for the purpose little if any pruning is advisable.

Sorts of Citrus Fruits.

Will you kindly through your columns give me the following information, which is the most profitable variety of orange, grape fruit, and lemon to propagate, the monetary value of same, on the markets, and any other information in relation thereto.—Isthmus Fruit Co.

The two chief varieties of orange for commercial planting in California are the Washington Navels and the Valencia Late; in lemons the Eureka Supreme, and in pomelos (Grape Fruit) Marsh's Seedless is popular. For detailed information on the whole subject of citrus fruits, send 25 cents to R. M. Teague, San Dimas, Cal., for a copy of his booklet, "The Citrus Fruits: Historically, Horticulturally and Commercially."

Ailing Palms.

I have an avenue of palms three years old and this summer two of them have died. I have been giving them plenty of water. I dug them up thinking that perhaps it was a gopher, but can find no signs of one as the roots and heart of the tree are in good condition. The palms seemed to be all right and in two days they had wilted down. The palms were not close to each other, nor did they die at the same time. Can you tell me what the trouble is and a remedy?—Subscriber, Exeter.

This inquiry has been submitted to several plant sharps without a solution of the trouble. If the root and heart of the plant is absolutely healthy, there can be no excuse for the palms failing to grow. We suggest a more careful examination, and suggest to our correspondent that he consult his best local nurseryman by asking that he inspect the plants.

Alfalfa Meal.

Can you inform me to whom I could write in reference to machinery for making alfalfa meal for stock. Also where there are any alfalfa mills located in this section. Your answer will greatly oblige.—J. M. D., Riverside.

Any one of the following handle this machinery: Arnott & Co., Newell Mathews Co., and Hawley, King & Co., all of Los Angeles. There are alfalfa meal mills at El Centro and at Stockton.

Grape and Apple Vinegar.

Will you kindly give through the columns of your valuable paper a recipe for making apple cider vinegar and also the making of vinegar from grapes? Would like detailed instructions.—"Amateur," Morgan Hill.

To change grape juice into vinegar it is necessary to ferment it as completely as possible. This may be accomplished by adding strongly fermenting grape-must to the juice. When the fermentation has come to a standstill the fermented juice should be inoculated with vinegar bacteria. In order to prepare a starter of these bacteria proceed as follows: Take one-half pint of a good wine. Dilute it with about one-third this quantity of boiled water. Place it in a flat porcelain dish and cover with a plate to keep out the light, in such a way as to allow free access of air. Place the dish containing the diluted wine at an even temperature of about 18 degrees, centigrade, (64 degrees Fahrenheit. In two to three days the surface of the liquid will be covered with a film of the vinegar bacteria and it will have a pleasant strong smell of vinegar. Sufficient starter for the inoculation of about 200 liters (50 gallons) of wine will be obtained in this way. The starter should be added to the wine, which is placed in puncheons. The bungholes are left open, and the puncheons filled to about two-thirds of their capacity. If the wine is kept at a moderately warm and even temperature the vinegar will be ready in from two to three months. If the temperature is cold and uneven if will take longer.

The same procedure also applies in the making of apple cider vinegar.

Hogs and Alfalfa.

Have something like thirty acres of alfalfa, worth at present time $8 to $9 per ton in the field (loose) with prospects of its being cheaper another year. 1. Would it not be more profitable to feed to hogs (feed or pasture, which)? 2. What are most profitable or best kinds? 3. How many head will one acre support (approximately)—yield in hay 10 tons per acre per season? Have other ground to raise other products also—grain, beets, pumpkins, etc.—Subscriber, Burbank.

These questions are not easy to answer. Personally I could make more money with hogs, but then I have the foundation stock. The present prices are very high to start in a new enterprise with. Then, too, if there should come a sudden drop in

TREES

"Jock, when ye hae naething else to do, ye may be aye sticking in a tree; it will be growing, Jock, when ye're sleeping."—Sir Walter Scott, in the Heart of Midlothian.

The rainy season has begun and with it comes the thought of tree planting.

Every prospective planter of trees or vines should have

California Horticulture

The Fruit Growers' Guide

By Geo. C. Roeding

120 pages, 7¾ by 10¾. Beautiful lithographed cover. Profusely illustrated with halftone engravings and color plates. It not only lists but describes 2000 varieties of trees and plants. Contains valuable suggestions on soil, preparation, planting, cultivating, irrigating and pruning. Price, mailed, 25 cents.

For more than 25 years we have been growing nursery stock in this state, and we believe you will find that our experience and suggestions will be of value to you.

Plant Fancher Creek Nursery True-to-Name Trees

And you will have nothing to regret.

Our nursery embraces over 1500 acres, located in the most fertile and favorable spots in all California for the propagating and growing of first-class nursery stock of every description.

Deciduous, citrus, ornamental trees, grape vines, palms and roses.

PAID-UP CAPITAL $200,000.00

Box 12 Fresno, California, U.S.A.

price the increase in numbers may be wiped out by the shrinkage in value. The commercial side plays quite a figure in the matter as one cannot possibly eat all he raises himself. This land should carry by the year readily eight sows to the acre if the pigs are sold off at fifty pounds each. I would buy brood sows to start with, as good as I could get, but would not be particular as to breeds and start in with one man to care for them. As soon as the pigs are dropped each sow should have a separate place for a week or so until the pigs know their mother perfectly. One source of loss is in buying pigs or sows from unknown people. The danger of disease is very great and when it once takes hold of a bunch they nearly all go. One man can look after quite a number of hogs if he has nothing to do but care for them. Any of the breeds are profitable enough to make them worth trying. In California, however, we avoid the white pigs as more subject to mange than the darker breeds. We use pigs as a side issue and feed them skim milk, melons, pumpkins and cull vegetables. We keep ten to fifteen sows and they are dropping their litters during April and May and then again in September and October. So far we have averaged ten pigs to a litter from six sows, eleven pigs from two sows and twelve from two sows. The rest of the bunch have not as yet arrived. Last spring we fell down a little and had about eight to a sow. The fall bunches are always larger. We do not expect that the rest of the sows will give us as many pigs for it would make it a banner year.—M. E. S.

Potatoes Not Blooming.

Regarding potatoes here, the plants do not bloom evenly and some not at all. Is there any variety that has a stronger tendency to bloom than others, or does it make much difference?—L. E. A., Hemet.

The improved sorts of potatoes have been bred so closely for tubers rather than seed production, that the flowering proclivities have been almost entirely eliminated. As a matter of fact non-flowering is an advantage.

Grafting Black Walnuts.

I have some trees of the native black walnuts, Juglans Californica. Is it possible to cut these trees back and graft English walnuts on them? If it is done, will they produce first-class nuts?—F. W. P., Altadena.

Nurserymen are using the native black stock and as a rule orchardists prefer it to any other, though it is not used exclusively. Your large trees may be cut and grafted at the proper season, i.e., when they are dormant, preferably a short time before growth starts in the early spring.

Green Manuring.

What form of green manuring should I use on sandy soil near Redlands for orange planting? Would alfalfa make sufficient growth from the winter rains? Will alfalfa lie dormant after rains are over or will it die?—Subscriber, Redlands.

We cannot determine from the question whether the inquirer wishes to prepare ground before setting his trees or whether he wishes to set them next spring. If they are to be set at that time we would prefer vetch. It makes probably the best winter growth and the best results with it are gained by irrigation. Alfalfa is very desirable as a green manure crop if it can be allowed to stand until the roots go to some depth. When plowed under the aeration of the soil is beneficial as

Pure
Alfalfa Seed

Good crops cannot be grown from weak or foul seed. Many fine stands of alfalfa have been ruined by the love vine and dodder that was not removed before sowing.

We have installed an alfalfa seed-cleaning machine that insures absolutely pure seed, and our stock is selected from only strong and healthy fields.

Germain seeds are not always cheapest in price, but you will surely get a dollar's worth for a dollar and be certain of the quality.

SPRING & FOURTH STS··LOS ANGELES

well as the green stuff actually plowed under. By "lying dorman after the rain" we understand the inquirer wishes to know if it mai tains its green growth during th summer. With reasonably moist soi it will do so. Green manuring accomplishes best results always when irrigation may be practiced.

White Rabbits.

Where may I obtain white rabbits —L. D. Hanford.

This query we will pass to our subscribers as we do not know of anyon who has made the breeding of thes pets a business. Doubtless there [illegible] many in the state who can suppl our Kings county subscriber.

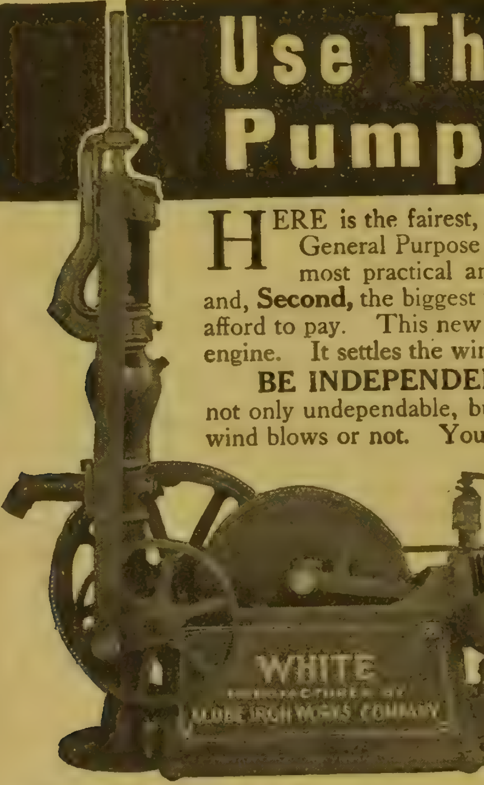
White Scale.

We have from subscriber at S Ana box containing orange l and small branches badly inf with white scale or cottony cus scale (Icerya purchasi). While letter accompanied the request assume the inquirer wishes to kno treatment and would recommend h writing to State Commissioner Je frey at Sacramento for colony Novius cardinalis.

Experiment with Arabian Alfalfa.

Last March I received seed of Ar bian alfalfa from the Department Washington, distributed for expe mental purposes. This was planted once and on September 3rd I ma the fourth cutting. During the su mer I cut as much from this recent seeded plat as from a year-old fie of the ordinary, or Chilean, variet but at this writing, September 28 the Arabian is far outdistancing t Chilean. I expect to make the fi cutting next week.—J. W. Anders El Monte.

Use This Wonderful White Pump Engine 10 Days FREE



HERE is the fairest, squarest Farm Engine offer ever made. We ask you simply to take the wonderful new White Pump and General Purpose Engine and prove by actual trial upon your place that it is all we say—**First,** the simplest, strongest and most practical and reliable small size engine built today—**the real solution of the Farm Pump Engine problem,** and, **Second,** the biggest value you ever heard of in a farm engine; at last—a practical, powerful all-around engine at a price you can afford to pay. This new White engine, which we call "the little brother of the big White boys," is of course, first of all, a Pump engine. It settles the wind-mill question to stay settled.

BE INDEPENDENT OF THE WIND. The Wind-mill has seen its best days. It's a back number. Wind-mills are not only undependable, but they are positively dangerous to oil or repair. If you own a White engine, you can smile whether the wind blows or not. You can have all the water you want, whenever you want it. No waiting for the wind to come up; no pumping by hand. With an overhead tank and a garden hose and this engine to pump the water you have an ever-ready fire protection. You simply can't afford to be without it.

Sent Direct From The Shop To You

But not only is this engine the perfect pump engine—it's more than that, it's a "man of all work"—a regular giant for work and wear. Though built particularly to fill the big demand for an absolutely reliable pump engine, it is adapted for runing any kind of machinery requiring moderate power So simple anyone can run it—even a ten-year-old boy. Will run constantly, day and night. Never gets overheated or misses a stroke. Requires no attention while running. It's self-oiled, self-fed, self-regulated in every way. A real 4-cycle engine—mind you, not a cheap 2-cycle style. It's a marvel of simplicity, durability and power. Adapted for every purpose.

It takes but a minute to uncouple this little giant from the pump and move it anywhere. Emits no smoke or sparks. Perfectly safe to use in a barn, milk-house or your home. It will run your cream-separator, grindstone, feed-grinder, circular-saw, corn sheller, root cutter, washing machine, churn, sewing machine, bone-mill, horse clipper, sheep-shearing machine, or half a dozen different machines at once. Will run any kind of machinery on earth requiring up to 1½ horse power. And our astonishingly low price means a positive saving of fully one-half. Considering what this engine will do—its saving of fuel—its wonderful durability and simplicity—its many practical features not found in any other engine—the price is only about fifty per cent of what it should be. We are enabled to make this astonishingly low price because of our unusual facilities for buying raw materials, manufacturing in large quantities and because the White is sold to you direct. **You save all the dealers' profits.**

10 Days Free Trial To give you a chance to satisfy yourself that this is the most reliable, the best, the easiest-running general purpose and pumping engine ever made, we allow you ten days free trial before you accept it. We pay freight both ways if you are not fully satisfied and you are not out one cent. You have a chance to give it a thorough trial doing your own work, on your own place. You can see for yourself how easy it is to run, how little fuel it uses and what an actual time saver, labor saver, and money saver it is.

This Wonderful Engine Need not Cost You A Cent

We not only save you half on the first cost of your engine and guarantee that the running expense will be less, but we have an interesting new selling plan that will astonish you. We have worked out an entirely new plan whereby this engine can be made to pay for itself. You can get it practically free. We want you to have this information now It's free, absolutely. Just fill out the coupon at the right and mail it to us today. Do it at once before you lose the opportunity. Just get your pen or pencil—fill in the blank lines—clip the coupon and send it along. We'll mail you this Free Engine Plan right off and you can judge for yourself what a remarkable engine proposition this is.

Remember—No Pump-Jack Needed No bolting down or clamping to the body of the pump. Nothing to do but set the engine in place, connect the Pitman rods and she's ready to pump water, night and day, just as long as you want. Base of engine rests on base of pump, holding it securely so that the thrust engine does not jar the pump-joints loose or rip up the floor. Lifting of the pump, so common with other engines is entirely done away with. By cutting out the pump-jack, we save you $7.00 to $12.50 and give you a far more satisfactory pumping engine.

GLOBE IRON WORKS CO., Menomonie, Wis.
Manufacturers of the White Gasoline Engine.

MAIL THIS COUPON TODAY

GLOBE IRON WORKS CO., Dept. 16

If you are interested in facts and figures about these larger engines write us a letter stating just what you want.

Business Notes

RICH LANDS.

The opportunities for the young an of today are great. Rich lands, not for the asking but at reasonable figures may yet be had. With eyes open and a large look, opportunity may be seen and in a few years less fortunate persons may say "Why did I not know of this avenue of wealth?"

The Cotton Land Company, an Arizona corporation, is now placing on the market and opening up for sale a large tract of land on the Colorado River opposite the town of Needles. This tract is composed of a rich silt soil of sedimentary origin and is irrigated by a gravity system owned by the Cotton Water & Irrigation Company, a mutual company, stock of which goes with the land.

The natural advantages of Cotton Rancho, situated as it is on the Banks of the Colorado River close to the main line of the Santa Fe makes it an ideal place to raise alfalfa, cotton and other products. There being no other agricultural lands for hundreds miles along the Santa Fe, Cotton ncho has a high priced market its products.

e tract is offered for sale by W. Hollingsworth & Company 123 6th street, Los Angeles, Cal.

e Layne & Bowler Co. of Califor- 2116 Violet St., Los Angeles, re- t that they are unusually busy both the field with their rotary and in applying their patented Layne screen for water wells, patented centrifugal pumps, steel pit, etc. They are now completing the second 1700 foot well for Stoddard Jess in San Joaquin Valley.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines, farm machinery that will do same work as new at half price. Complete saw mill, including stickers, circular and band saws, blower, planers, 80 H. P. steam outfit. Also 1400 ft. nearly brand-new 8-inch riveted, galvanized irrigating pipe, 1400 ft. 2½-inch standard, 1400 ft. 1½-inch standard, very cheap. Small distillate tanks, 50 gallons up. Domestic and irrigating tanks, galvanized and redwood, 500 to 10,000 gallons, also 50,000 gallon redwood tank, fine for storage or irrigating. Steam engines with steam pumps; gasoline engines, 3 H. P. Fairbanks engine, geared pump jack, pipe, pump complete with 22 ft. tank stand, 2,000 gallon tank all for $150, also many other sizes. Special 20-day bargain; 12 H. P. Fairbanks engine, No. 2 deep well Ames double acting pump jack, 65 ft. casting, rods, and double acting cylinder, 50 ft. belt, all complete and now pumping 20 inches water from 65 ft. well into large reservoir 110 ft. on top of hill. Our price $380 on cars if taken before we have to move it. Also another complete mounted wood sawing outfit, $300. Gang, disc, road, riding, walking plows, cultivator, feed rack, bone grinder, Fresno, wheel and slip scrapers, wagons, surrey, grading tools, sundries. Demmitt Co., upstairs, 120 N. Main, Los Angeles.

For Sale—11 H. P. White & Middleton gas engine at the right price. To prove its fine condition, will guarantee for a year. Machinery Exchange, Main & Bruno Sts., Los Angeles.

For Sale—Gasoline engine. We have the stock. If you want a second-hand engine with our guarantee for a year against all defects, see us. Bailie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

LIVE STOCK.

Ben W. McCloskey & Co.,
700 Union Trust Bldg., Los Angeles, Cal.

REAL ESTATE.

OWENS RIVER VALLEY—You are invited to see the products of this wonderful valley now on exhibition.

In our office you will see corn, equal to the best produced in Illinois, Iowa or Nebraska. You will see photos showing this corn growing 14 feet high and be told that 80 bushels to the acre is not uncommon.

You will be shown apples, potatoes and onions and your first remark will be "The best I have ever seen in California."

You will be shown timothy hay with such heads that you will acknowledge you never saw their equal before.

You will see red clover, wheat and red top, all of which will prove to you that a country which can produce it must be a good one.

You will see honey equal to anything produced in America, honey that took the first prize at the Portland Fair.

You will be told of a country more perfect in climate than you have dreamed of and as beautiful as a combination of mountains and valleys could make it.

If farm lands interest you at all, you should come to our office, if only to satisfy your curiosity. You owe it to yourself to at least see what we have to offer, before making your decision.

Send for booklet. JAMES R. H. WAGNER, H. S. COOK, Sales Agents, Room 13, 329 South Hill St., Los Angeles, Cal.

Alfalfa land in a genuine Southern California Alfalfa District.

A loam, level as a floor.

Every foot of it water-bearing.

One of the few close-to-railroad, high-grade, bottom-valley-land, irrigable ranches remaining at a very moderate price.

Will make a fortune in dividends and increased value as an alfalfa shipping or dairy proposition.

Near Riverside.

260 acres, partly developed, has 50 H. P. pumping plant.

Nearby an aggregate of 2000 acres in perfect stand dividend-paying alfalfa.

Don't let the other fellow beat you to it. John W. Thompson, 522 S. Main St., Los Angeles, Cal.

For Sale—$35,000 orange grove. $8,000 crop on trees. W. D. Robinson, San Dimas, Cal. R. F. D. A35.

FARM LANDS FOR SALE.

For Sale—The Blackstone Tract of 280 acres in Fresno Co., 14 miles from Fresno, has been subdivided into 20 and 40-acre lots and is now on the market at $125.00 per acre, and is classed with the best lands in San Joaquin Valley. It is all level, no alkali, subirrigated and situated in the center of a dairy and fruit-raising district. Land has had two plowings this year and is now ready for planting to alfalfa, grain, or fruits. Samples of soil sent to Berkeley gave the following: "Your land is suitable for alfalfa, peaches, pears, and Thompson Seedless grapes and grain." I have a good water right with place in 2 companies. For particulars write to Geo. H. Hudson, Conejo, Fresno Co., Cal.
For Sale—

Tulare—20 acres fine alfalfa land, 6 miles West of Tulare. Nothing better can be had. Sediment soil. Abundance of water, fine roads, good neighbors. You know Tulare is the finest dairy section in the state. Try this for alfalfa, cows, hogs and poultry. Price $125.00 per acre. Easy terms. E. D. Cowan, 301 Mason Opera House Bldg., Los Angeles.

Alfalfa Ranch of 86 Acres—63 acres in alfalfa. Splendid water right. Close to good market, 1½ miles from good town, fine schools, $22,000. Terms. Some good bearing orange and lemon orchards in practically frostless belt. Splendid water rights. 55 miles from Los Angeles. Splendid climate. Correspondence invited. Ben F. Thorpe, Fillmore, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—11-acre walnut, fruit and vegetable ranch just outside city limits of beautiful Santa Barbara. Location finest can be had, situated on main thoroughfare between San Francisco and Los Angeles. Comfortable buildings, an abundance of water. Will sell cheap if taken at once. For further particulars address M. E. Hill, Route 2, Santa Barbara, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

20-Acre Ranch—In the orange belt north of Exeter. 10 planted to oranges, well that tested over 100 inches, with pumping plant installed. Electric lights, running water, and ideal location. ½ mile from railroad. For one desiring a home, they could not find things nicer or location better. Address Box 103, Visalia, Cal.

40 or 80 Acres Land adapted to alfalfa, almonds, oranges. Sandy loam soil with some gravel. Adjoins the Government Model Irrigation Project and is an ideal pumping proposition; water at 20 feet. 3 miles from growing town and best roads in California. Will sell at a price that will double in 2 years. One 40 acres improved; other in pasture. C. M. Baldwin, Orland, Glenn Co., Cal.

$6,500 Buys 120 Acres—Situated 3 miles south of Santa Maria, good improvements, plenty water, orchard, large barn and corral, chicken houses, windmill, tank, tank house, and modern six-room cottage with bath and pantry. Every modern convenience. Address R. Morrison, Owner, Santa Maria, Santa Barbara Co., Cal. Box 171.

Irrigated Land For Sale, Cheap—In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address Manager, American Rio Grande Land & Irrigation Co., Mercedes, Hidalgo County, Texas.

For Sale—480 acres, 20 miles of Delano. All fenced and cross fenced in 4 fields. Some improvements. Large body of water by damming creek. 4 wells and one spring. Water rises within 5 ft. of surface. Price $15.00 per acre. $3000 down, balance mortgage. Investigate quick. Parrish Barker, 207 Union Trust Bldg., Los Angeles.

Wanted 300 Farms—Let experienced, reliable people sell or exchange yours. We handle country property exclusively and desire your patronage as we have customers wanting desirable large farms. Mail particulars, terms, etc., quickly. Parrish Barker, 207 Union Trust Bldg., Los Angeles.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal

Fruits, Flowers, Sunshine, Progress—All these invite investigating beautiful Hemet Valley, Southern California. Booklet free. William Kingham, Hemet, Riverside County, Cal

25-Acre Ranch—With buildings, water, some fruit, close in Santa Rosa. Sell all or part. Albert Bacon, R. D. 5, Santa Rosa, Cal.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

For Sale—In Sutter County, California, choice fruit and alfalfa farms. 10 to 40 acres. E. L. McCune, Yuba City, Cal.

FARM LANDS FOR SALE.

Tulare County Dairy Ranches Pay—I have several very attractive propositions in lands adapted to dairying, alfalfa, hogs and cattle. Some of them with artesian wells and pumping plants. Immense body of surface and artesian water underlaying the surface from 12 to 20 feet. On main line railroad. Close to town and schools. Telephone and electric lines near. Some improved places. Values are increasing fast but I can show you property with some improvements at $40.00 and up. Also have cheaper land that contains some fine alfalfa land and balance grazing. C. H. Biggin, Pixley, Tulare Co., Cal., or 1813 S. Union Ave., Los Angeles.

Farms Wanted—Don't pay commissions. We find you direct buyer. Write, describing property, naming lowest price. We help buyers locate desirable properties free. American Investment Association, 12 Palace, Minneapolis, Minn.

For Sale—Quite a variety of alfalfa and fruit ranches in several counties. Also some land in good, new settlement. Send for descriptive list. Address, W. S. Ritchie, Corona, Cal.

POULTRY.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

Hayes, R. B., Poultry Fancier and Rhode Island Red Specialist—30 breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 35, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

"There's very little heat. But try this with an ordinary lamp and see what happens."

LIGHT—NOT HEAT

The Angle Lamp gives less heat than any other method except incandescent electricity. Will *not* scorch or discolor your ceiling, etc. Eliminates possibility of fire. Gives well distributed shadowless light without dangerous and unpleasant heat—delightful to read or work by.

The Angle Lamp

is the simple, economical, convenient and perfectly satisfactory method of burning common kerosene. It *never* smokes or smells whether burned at full height or turned low. *Lighted and extinguished like gas.* Filled like a water bottle. Requires filling about once a week.

The Cheapest Form of Light

Being fully ⅓ to ½ more economical than even the ordinary lamp it soon saves its cost. It is made in 32 varieties. Come in and see it or *write for catalog.*

Boesch Lamp Co. 1135 Mission St. San Francisco

Established 1869. Incorporated 1890.

THE WOLF AT THE DOOR.

At last the good man's temper rose,
He swung his stool and deadly blows
Delivered, Smash! on snarling nose
That forced his flimsy door.

'Twas killed! He skinned it on the spot
And clapped the carcass in the pot,
Then blew the coals; when they were hot
Behind him locked the door.

Set out for town, returned with sack
Of onions, salt, white bread and black,
And, ah! the whiff, as he came back,
Of wolf stew through the door!

"I got nine rubles for his hide
And bounty on his ears, beside,
It's not a healthy place," he cried,
"For wolves before my door!"

So here's the nub; don't sit and fret;
There's bounty paid on wolf ears yet;
Pick up your stool, go out and get
That wolf before your door!

—Charlton Lawrence Edholm in Country Gentleman.

GETTING READY TO GO.

Miss Belinda's sister Catherine, and Bess, Miss Belinda's niece, were helping Miss Belinda close her country home for the winter.

"You must have that lavender silk waist made over, Belinda," said stylish Catherine, as her sister laid out her wearing apparel in preparation for packing. "It's handsome material, but it's quite out of date."

"I don't believe I'll have it altered for myself," demurred her sister. "I'd rather give it to old Brita."

"Who is old Brita?"

"Why, mother," said Bess, "don't you know old Brita? She's Aunt Belinda's pet. Last Monday afternoon, while you were driving with Uncle Ben, I actually found Aunt Belinda playing the piano to old Brita, who was folding and sprinkling the clothes. And I'm quite certain that the change of the dinner hour on Mondays is for Brita's sake."

"Now, don't laugh, Catherine, at Bessie's teasing," said Miss Belinda, laughing herself. "My laundress, Brita, is a deal little old woman who insists on earning her own living around here. She cannot stay for our usual evening dinner, because she has to go home early to milk her cow, so I have dinner at noon on Mondays, and I tell Nora to give her the best of everything. She can work so much better if she is well nourished."

"Yes, of course," agreed Catherine, smilingly, for she knew her sister's ways.

"Come, mother, this is Monday, and Brita is here," said Bess. "Let's you and I have the fun of giving her the silk blouse."

They went into the laundry, where a bent, apple-cheeked old woman looked up from a blueing tub with eyes as azure as the water into which she was dipping the snowy clothes.

"Here, Brita, is something for you," said Bess.

Brita smiled broadly and, drying her hand, offered it to Bess. "Tell Miss Belinda t'ank," she said. Then after the little handshake she held the blouse at arm's length and murmured rapturously, "Style!"

As they went back in the house Bess said, laughing: "And you, foolish mother, thought the waist out of date. Did you notiec that she said 'T'ank Miss Belinda?' She thinks Aunt Belinda is the only generous person in the world."

Two days later Nora, the cook, having departed, the three members of the household went into the kitchen to prepare their last meal of the season in the country home.

"Don't you think coffee would taste pretty good this rainy day?" asked Bess.

"Oh, I'm sorry, dear, but we can't have coffee," said Miss Belinda. "I gave the few pounds that were left to Sammy Nelson this morning when he was helping me dig up my dahlia roots. His mother is not well and I thought some good coffee might help her."

"Well, I can make chocolate," said Bess.

"No, we can't have chocolate." Miss Belinda looked a little embarrassed. "I let Sammy have the last cake of chocolate. The poor little chap doesn't have much candy."

"I suppose there's no tea, either?" remarked Bess, in mock despair. "You doubtless gave that away, too?"

"Yes, but I saved enough out for lunch," answered Miss eBlinda brightly.

"I can make some hot biscuits to eat with the tea," said Catherine, rolling up her sleeves.

"Oh, I'm sorry I didn't realize that you'd be enterprising enough to want to make biscuits," apologized Miss Belinda, laughing. "I told Norah to take the flour and the baking powder to her grandmother with the tea and some preserves. But we have some crackers and fruit."

"Delicious luncheon—tea, crackers and grapes!" laughed Bess. "And you needn't bother to tell us, Aunt Belinda, dear, how unwise it is to leave provisions in the house and how you gave them away merely out of selfishness. We know all about that."

"You are a very saucy young person," retorted Miss Belinda, looking fondly at Bess. "Why, there comes old Brita through this storm. Bless her old heart, she wouldn't let me go away without saying 'Good-by.'" Miss Belinda opened the kitchen door as she spoke. "Come right in, Brita. You're just in time for some hot tea."

"T'anks; I bring present this time," said Brita, proudly opening the well-wrapped box she was carrying and displaying a large white cake. "I have mak' for Miss Belinda angel work."

"Angel work! Look, Catherine and Bess." Miss Belinda turned from the old, happily shining eyes to her sister and niece.

Angel work, indeed," murmured Bess.—Universal Magazine.

MEAT PIES AND SIMILAR DISHES.

Meat pies represent another method of combining flour with meat. They are ordinarily baked in a fairly deep dish the sides of which may or may not be lined with dough. The cooked meat, cut into small pieces, is put into the dish, sometimes with small pieces of vegetables, a gravy is poured over the meat, the dish is covered with a layer of dough, and then baked. Most commonly the dough is like that used for soda or cream-of-tartar biscuit, but sometimes shortened pastry dough, such as is made for pies, is used. This is especially the case in the fancy individual dishes usually called patties. Occasionally the pie is covered with a potato crust in which case the meat is put directly into the dish without lining the latter. Stewed beef, veal, and chicken are probably most frequently used in pies, but any kind of meat may be used, or several kinds in combination. Pork pies are favorite dishes in many rural regions, especially at hog-killing time, and when well made are excellent.

If pies are made from raw meat and vegetables longer cooking is needed than otherwise, and in such cases it is well to cover the dish with a plate, cook until the pie is nearly done, then remove the plate, add the crust, and return to the oven until the crust is lightly browned. Many cooks insist on piercing holes in the top crust of a meat pie directly it is taken from the oven.

Twelve O'clock Pie.

This is made with shoulder of mutton boiled with carrot and onion, then cut up, mixed with potatoes separately boiled and cut up, and put into a baking dish. The crust is made by mixing smoothly mashed potatoes to which a tablespoon of shortening has been added, with enough flour and water to make them roll out easily. A pie made of a pound of meat will require 5 or 6 small boiled potatoes, a cup of mashed potatoes, and 8 or 10 tablespoons of flour, and should be baked about twenty minutes in a hot oven. Salt, pepper, and other seasoning, as onion and carrot, may be added to taste. A teaspoon of baking powder makes the crust lighter.

Meat and Tomato Pie.

This dish presents an excellent way of using up small quantities of either cold beef or cold mutton. If fresh tomatoes are used, peel and slice them; if canned, drain off the liquid. Place a layer of tomato in a baking dish, then a layer of sliced meat, and over the two dredge flour, pepper, and salt; repeat until the dish is nearly full, then put in an extra layer of tomato and cover the whole with a layer of pastry or of bread or cracker crumbs. When the quantity of meat is small, it may be "helped out" by boiled potatoes or other suitable vegetables. A few oysters or mushrooms improve the flavor, especially when beef is used. The pie will need to be baked from half an hour to an hour according to its size and the heat of the oven.

Meat and Pastry Rolls.

Small quantities of cold ham, chicken, or other meat may be utilized for these. The meat should be chopped fine, well seasoned, mixed with enough savory fat or butter to make it "shape," and formed into rolls about the size of a finger. A short dough (made, say, of a pint of flour, 2 tablespoons of lard, 1 teaspoon of baking powder, salt, and milk enough to mix) should be rolled thin, cut into strips, and folded about the meat rolls, care being taken to keep the shape regular. The rolls should be baked in a quick oven until they are a delicate brown color and served hot.

Meat Turnovers.

Almost any kind of chopped meat may be used in these, and if the quantity on hand is small may be mixed with potato or cooked rice. This filling should be seasoned to taste with salt and pepper, onion, or whatever is relished, and laid on pieces of short biscuit dough rolled thin and cut into circles about the size of an ordinary saucer. The edges of the dough should be moistened with white of egg, the dough then folded over the meat, and its edges pinched closely together. If desired, the tops of the turnovers may be brushed over with yolk of egg before they are placed in the oven. About half an hour's baking in a hot oven is required. Serving with a brown sauce increases the flavor and moistens the crust.—Bul. 391, U. S. Dept. Ag.

"Home is peculiarly the place of rest, though the birthplace of all industries. The home has not kept pace with the industrial world in improving the methods of adjusting household affairs. Housework should be carried on with no more loss of time or energy than is involved in the conduct of any well-managed business. To be independent we must sacrifice many of the customs to which we cling. The old order is passing away and the sacredness of home will not suffer, but, instead, we will have a greater development and more opportunities for freedom and happiness."

New High Grade Automobiles

at Prices Lower Than the Price of Medium Grade Cars

To Prospective Automobile Buyers:

You naturally wish to purchase the highest grade car you can get for your money, and you naturally want a higher grade car than the dealer can afford to sell you for the amount of money you wish to pay—we will meet your views for a short time.

We have a limited stock to dispose of—all high grade—and all prices to meet the needs of moderate priced car buyers.

Whiting, Davis and Westcott Cars
in Two and Five-Passenger Models

These are not shopworn cars, they have never been driven a mile, and are the latest models received.

We have sold the lease of our garage and have not at present the necessary equipment and room at our store to properly handle automobiles, so we offer you the opportunity to buy a car of higher grade than you ever thought of owning and at a price no higher than is charged for a medium grade car.

Call at Newell Mathews Company, 200 North Los Angeles Street, Los Angeles, Cal., or write us, stating whether you wish to buy a one-seat or two-seat car and we will send you full information or have our salesman call.

Hay.

Scott, Magner & Miller say:

Arrivals of hay for the past six days have been 4200 tons, being just about the same amount that came into the market for the preceding week. We still continue to experience difficulties in obtaining sufficient cars from the railroad companies for the transportation of hay at various hay centers, and this fact has caused considerable difficulty lately.

Market prices have continued unchanged. With the exception of something strictly first-class the market is rather dull ,as other grades of hay do not move off well.

The orders that have come into this market for exporting and for coastwise shipments have been the leading features of the market lately, as it has been exceptionally good and large quantities of hay have been sent forward steadily from day to day to supply this desirable trade.

While a little purchasing is being steadily done in the country to simply supply the daily current requirements of our markets, no operations of any moment are reported from any section.

Alfalfa continues to arrive steadily in large quantities and is absorbed on orders held here to be filled, and for general local trade. This article is decidedly firm all along the line.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Fancy wheat	12.50@13.50
No. 1 wheat or wh and o	10.50@11.50
No. 2 wheat or wh and o	9.00@10.00
Choice tame oat	10.50@11.50
Other tame oat	8.00@9.50
Wild oat	8.00@9.00
Stock hay	5.50@6.50
Alfalfa	9.00@12.00
Straw	40@50

Grain.

Wheat, No. 1	1.47½@1.55
Barley, good to choice	96¼@98¾
Barley, fancy	1.00@1:01¼
Barley, poor to fair	90@95
Oats white	1.47½@1.55
Rye, new crop	1.50@1.55
Alfalfa seed	14@15
Mustard brown	.4½
Millet	.2¾
Flaxseed	5@5½
Broom corn seed, per ton	23.50

Feed Stuff.

Rolled oats, per ton	29.00@31.00
Middlings	34.00@36.00
Oil cake, per ton	40.00@41.50
Cocoanut cake, per ton	25.00
Mixed feed, per ton	24.00@27.00
Shorts	30.00@32.00

Deciduous Market

SACRAMENTO, October 22, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, October 21st, 1910:

Pears.—Four cars:

There have been no pear shipments during the past two days and movement is practically done.

Grapes— 196 cars:

Shipment of this fruit shows a falling off from last week of nearly 200 cars. Tokays are now nearly done. There are a few more straight cars of Tokays available, but in common with Cornichons and Emperors they can be offered for a few days in mixed cars. Emperors are available in straight carload lots and possibly a few Cornichons also.

Weather conditions have remained favorable during the past seven days and the prospects are now good for a continuation of same. Fruit is showing practically no effect at this end of the line from the unfavorable conditions that existed previous to last week.

Citrus Market

LOS ANGELES, Oct. 26, 1910.

No material change is to be noted in the orange market other than if anything a stronger feeling prevails. The few Valencias yet to go are of good quality and without question will command best of returns. Tulare and Fresno counties are shipping new crop Navels, but these have not reached the market yet, so that the reception to be given to them cannot be forecasted, Floridas have been a strong factor and it is presumed now that windfalls from the recent hurricane will fill the markets with low grade green fruit. For that reason California shippers may well allow Navels to hang on the trees for more perfect ripening. Some estimate that the damaged Florida fruit will be as great as twenty per cent, but in any case it will exceed ten.

A flurry in lemons has given the most sensational price of the year. It was caused by shortage in both Californias and foreigns and some prices as high as $12.00 were commanded in New York and other markets. $7.00 and $8.00 were common prices in all parts of the country. These exceptional prices are already tumbling because of the more liberal shipping of the new fall cut. This is true, not only of the California orchards, but the Mediterranean is beginning its fall cut.

Shipments.

Shipments of citrus fruit to date since November 1, 1909; 29,980 cars of which 25,256 were oranges and 4724 lemons. To same date last season: 37,871 cars, of which 31,741 were oranges and 6130 lemons.

NEW YORK, Monday, Oct. 24.—The offerings today comprised thirteen cars Valencias and one car lemons. Under what might be termed, at this stage of the game, a heavy offering, coupled with the fact that a large portion consisted of ordinary, poor colored fruit, the Valencia market, although holding steady, was prevented from making any further advances. The cool, favorable weather prevailing was much in favor of an increase in values but the liberal supply was slightly more than conditions warranted at the present time. With smaller offerings of better quality and cool weather continuing, the outlook for the rest of the week is favorable for a steady market with a possibility of values increasing over last week's record prices.

The first car of California lemons for some time past made its appearance today, and, as was expected and predicted, sold at prices that exceeded all expectations. The fruit was fancy stock and ranged $9.00 to $12.00, with the car averaging $10.85. The 300 size sold at $11.00, with 360s at $10.50, and the 270s bringing the record price of the season, $12.00.

Five hundred boxes Jamaica oranges sold today. The fruit generally was good and the market ruled strong and active. Fancy stock sold $3.45 to $4.25, averaging $3.82 for 126s and 200s and choice fruit $3.00 to $3.50, averaging $3.17 and $3.21 respectively.

here this week and the prospects for good if not unusual prices are favorable. The market is now bare of stock and the only available supply of stock is that furnished by California.

It is reported there are two or three cars of California lemons due to sell

CHICAGO, Monday, Oct. 24.—Lemons firm; supply small, and they are selling very well. Boxes, California choice to firm, $6.50@7.00.

Oranges steady; trade fair and supply rather light. Boxes, late Valencias, extra choice $4.25@4.50; choice, $3.25.

NEW YORK, Tuesday, Oct. 25.—Today's offering comprised five cars of Valencias. Under this moderate offering and with weather inclined to grow warmer, the market held steady and on the good grades showed prices a shade higher. A sale of 8000 boxes of Porto Rico oranges handicapped the California stock further and the probabilities are that without this handicap substantial gains would undoubtedly have been shown. The market ruled active through the sale, but the liberal offering of Porto Ricos which are cheaper and cutting excellent, had its due effect.

The Porto Rican season is well under way and from now on will be a serious competitor to California. While the fancy trade will absorb a certain amount of extra fancy Valencias at top prices, a great many buyers who were forced to buy California Valencias or take nothing to fill immediate urgent orders, will now buy the cheaper Porto Ricos, Florida, Jamaicas and Mexicans in preference. The condition of the Porto Ricos was generally good. Fancy ranged $2.50@3.50; average, $3.05, $3.18, $2.60 with choice $1.70 to $2.80 average $1.75 to $2.30. One car of Mexican oranges was sold. Fancy, $2.60@4.20; average, $3.13 and choice, $2.05@3.00, average $2.32. A small quantity Floridas sold from $2.10 to $3.70, averaging $3.42. The condition was fairly good.

Oranges—There is a steady call with Californias in small supply. Some Floridas and Mexicans coming. Grapefruit is also steady and selling fairly. Boxes—Late Valencias, extra choice, $4.25@4.50; choice, $3.25@3.75; Floridas, not fully ripe, $2.75@3.00; Mexican, $3.50@3.75; grapefruit, Florida crates depending on size and color, $3.00@3.75.

BEET PULP.

Secretary James Wilson, of the United States Department of Agriculture, takes a comprehensive view of all questions affecting the welfare of farmers and dairymen:

In a conference with the agriculture committee of the Denver Chamber of Commerce, August 8, he expressed his regret at the fact that the beet sugar industry in Colorado is not used for its full value. His reference was to the neglect of the beet pulp, which he declares is the best butter producer in the world.

Many people, however, are not ignorant of the facts he states, but on the contrary are availing themselves of the opportunity which beet sugar factories afford them to get supplies of sugar-beet-pulp, not only to feed while the factory is running, but many have erected, and are erecting, silos to hold a sufficient supply for their needs during the remainder of the year until beet slicing begins again.

Those who have done this have proven to their own satisfaction that the best results in the handling of a dairy are obtained when they keep up the milk flow as nearly the year around as possible.

OF VALUE TO HORSEMEN.

Do you turn your horses out for the winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam applied as per directions, just as you are turning the horse out will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the horse is having a rest. Of course it can be used with equal success while horses are in the stable, but many people in turning their horses out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

AT KENTON STATION.

The Oregon offices of the Pacific Tank and Pipe Co. which have been located at 210 Wells Fargo Building, Portland, are to be moved to the factory at Kenton Station Portland, Oregon, after November 1.

The office will be most commodious and complete in the big, new office building which adjoins the factory. The big concern is the one which manufactures pipe for water systems, machine banded pipe, continuous stave pipe, irrigation pipe, wood and steel towers, water tanks, oil tanks wine tanks, mining tanks, cyanide tanks, zinc boxes, automatic distributors, zinc lathes, discharge doors, agitators, classifiers, planing mill work, disappearing doors and boxes.

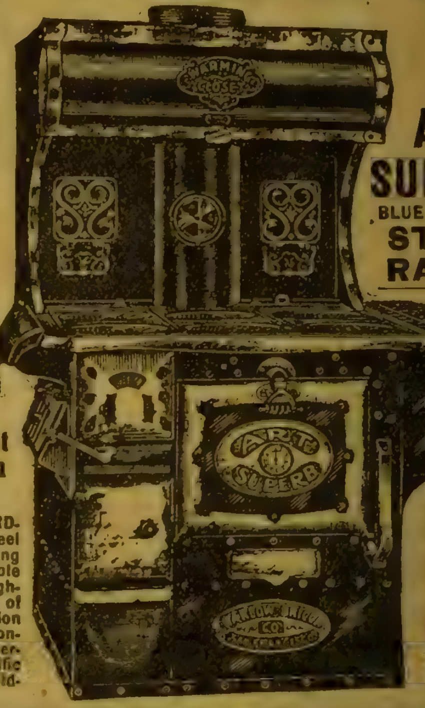
17 REASONS

WHY YOU OUGHT TO BUY OUR SIX HOLE



ART SUPERB BLUE POLISHED STEEL RANGE

This Stove is Built in Our Own Factory

OF HEAVY HARD-ROLLED BLUE steel plate, possessing the greatest possible strength and toughness. In point of design, proportion and mechanical construction it is as perfect as a scientific study of range building can make it.

As Illustrated Without Reservoir

31.65

OTHERS FROM \$26.95 to \$36.55

IT WILL BURN HARD AND SOFT COAL, COKE, WOOD AND CORN COBS

THE 17 REASONS This range has interchangeable key plate top; feed pouch or broiler door; option of 16-18-20 inch oven; handy direct-draft damper; large smoke pipe; circular smokepipe check; duplex grate; cast-iron flue box; famous fuel-saving, California extension fire-box; large ashpan; sliding draft poker door; fire door; balance oven door; high closet; tea-pot stands; ash-pit door; all finely nickeled and polished and ready to set up.

THE BODY
Is made of cold rolled polished plate steel. Requires no blackening. Parts exposed to the heat thoroughly protected by asbestos sheet covered with steel. Closely riveted.

THE OVEN
Heavy steel, protected and strongly braced. Seams and joints riveted. Will not warp or buckle. Patent balanced door. Adjustable steel shelf. Bright inside.

THE FIRE BOX
Is latest improved California oblong curved end. Wood burning extension. Heats perfectly without waste. Gas and smoke consumer. Ventilated lining.

WARMING CLOSET
Is extra large. The door operates on roll hinges. Accurately balanced. Can be opened easily with one hand. A practical necessity. Handsomely trimmed in nickel.

DON'T PAY THREE PRICES FOR A STOVE In our big book you will find listed every class of stove you could possibly want from a camp stove to the largest steel range. Cast iron cook stoves, airtights, oil stoves, heaters, gas ranges and hot plates; all at strictly wholesale prices. Write for our mammoth fall and winter catalog today.

SPRAYING: WHEN, WHY AND HOW TO DO IT

Spray Formulas and a Calendar Outlining Treatment for Fungous Diseases and Insects. Tables Worth Keeping for Reference. Profitable Crops Require Attention to Pests.

The number of troubles affecting growing plants is so great that many become discouraged and feel that all nature is combined against them. There are others, however, who look at these "troubles" as a blessing. We once heard a most successful orchardist refer to the red scale as one of the greatest blessings that ever struck his community. He said that it was one thing that helped to prevent overproduction. The shiftless, lazy ranchers became discouraged and quit, and the energetic man who continued the fight, grew good fruit and secured good prices. To a degree this may be true, for it must be admitted that in sections where fruits grow spontaneously, as in the tropics, a most shiftless class occupies the ground. There are some troubles, however, which even energetic treatment has failed to remove. Once fully established it seems impossible to eradicate them. Therefore preventive measures through resistant plants or otherwise must be adopted. For the troubles which may be reached by sprays and similar treatment, we have gathered together a number of formulas and methods of handling which we believe will make this issue of the Cultivator worth preserving for reference.

The troubles or diseases which confront the grower may be divided into three general classes. The first we may call physical. These may be caused by conditions of the air, soil or water. Second, plant parasites, of which there are two general classes, bacteria and fungi. Third, animal parasites and pests, which may also be divided into two general classes, those which attack the roots and those which attack the stems, branches, leaves flowers and fruit.

Physical Troubles.

In the first division, troubles caused by physical conditions, common sense is the principal treatment. You cannot "farm against climate," so it is presumed that climatic conditions have been observed before the orchard was planted. Another harmful condition of the air is caused in certain localities of this state where smelters have been established and release into the atmosphere poisonous gases which make impossible culture of the ground within a certain radius. Of course the only treatment for such a trouble is to remove the cause. The physical condition of soil leads into too extended discussion for treatment here other than mere reference to some of the troubles caused by it. The common "gum disease" of the orange has been shown to be caused by compacting of the earth about the roots. Mottle leaf is possibly another example. Another is death of plants from soggy condition of the soil continuing so long as to shut out air from the roots, which is a requisite for all healthy growth. Water and its chemical constituents are factors in the health of all plants. Too much alkali in it, for instance, means the death of the plant.

Parasites of Vegetable Nature.

The first plant parasites mentioned above, bacteria, are almost impossible to control. An example of this trouble may be seen in pear blight and walnut blight. The cause is within the tissues of the plant so that it may not be attacked by any spray. The only method of combating is by removal of parts diseased, or still better, use of resistant varieties. For example, the Kiefer pear is comparatively resistant to blight. The Bartlett, on the other hand is most susceptible, but its quality demands its continued culture, and growers have found a measure of success in cutting off and burning diseased parts of the tree, using care in disinfecting tools and wound left by cut to prevent further spread of the disease. This method of handling has been found to be especially effective where entire neighborhoods unite. Again, in the case of annuals, sterilizing of seed is sometimes efficacious. For this purpose corrosive sublimate, sulphate of copper and other chemicals are used.

Fungi.

Many of the fungous troubles are more easily reached through sprays, though some are as perplexing as the bacterial troubles. Of fungicides there are many, though the one principally used is the Bordeaux mixture. Its use, however, is almost entirely as a preventive, for after a fungus has taken possession of a plant and begun to draw its sustenance from the inner tissues, it is impossible to remove it without destroying the plant. The mildews and one or two other troubles may be reached after they have put in an appearance, but once the rusts and smuts have taken possession, they cannot be removed.

Where coloring of the fruit is objectionable, the ammoniacal copper carbonate is often used. The lime-sulphur wash is one of the combined fungicides and insecticides, and it is one of the best. Other fungicides are potassium sulphide, flowers of sulphur, copper sulphate, corrosive sublimate, and formalin.

Animal Pests and Parasites.

The most difficult of the animal pests to reach are those which attack the roots. As examples of these insect pests we may mention phylloxera, borers, wooly aphis. These pests may be reached to only a very limited extent by use of carbon bisulphide, tobacco extracts, gas lime, or other similar materials spread on the ground and covered. The more satisfactory method is the preventive by use of resistant stocks.

Insects which attack the top or above ground portions of plants are divided into two general classes, the biting and sucking. The biting insects, or mandibulates, eat the leaf or fruit. There are a great many of this class which may be illustrated by the codling moth, potato beetles, slugs, caterpillars, etc. These are reached through their stomachs by use of poisons which may be dusted or sprayed over the plants or mixed with baits, or sometimes the pest may be destroyed by contact insecticides the same as are used for the sucking insects.

The sucking insects, under which class come all scales, aphis, and the mealy bug, can only be killed by application of a caustic or some substance which closes the pores of their bodies, usually in the form of a spray, or still better, they may be reached by fumes of poisonous gases. The only gas which has been used to any great extent for this purpose is hydrocyanic acid gas.

FORMULAS FOR FUNGICIDES.

1. Bordeaux Mixture.

Notwithstanding possible injury from the use of Bordeaux mixture, it continues to be the most generally used of any fungicide. Its effectiveness and harmlessness to plants depends upon care used in its manufacture, on condition of atmosphere and of plant. The formula ordinarily used, the 5-5-50, is entirely harmless when the plant is dormant. It may also be used on some growing plants; others it will kill or greatly injure. It may be used even stronger than the formula given when the plant is dormant, but these proportions are effective with most fungous troubles. By the 5-5-50 formula is meant:

(a)	Copper sulphate	5 pounds
	Stone lime	5 pounds
	Water	50 gallons

The weaker solution is

(b)	Copper sulphate	3 pounds
	Stone lime	5 pounds
	Water	50 gallons

To mix, dissolve the copper sulphate with water in proportion of one pound of sulphate to sufficient water to make one gallon of solution for each pound of sulphate used. The stone lime may be slaked and dissolved in water in the same proportions as the sulphate. This gives convenient stock solutions, every gallon of which contains one pound of lime or of sulphate. To make the mixture from these stock solutions take, say, five gallons of the lime solution which will contain five pounds of stone lime, and five gallons of the sulphate solution which will contain five pounds of copper sulphate. Five gallons of each of these two solutions may now be mixed with water by pouring through a strainer into water sufficient to make 50 gallons. Do not mix the solutions before pouring into the water.

2. Ammoniacal Copper Carbonate.

Copper carbonate	5 ounces
Ammonia (26° Baume)	3 pints
Water	50 gallons

The strong ammonia which must be handled carefully, may be diluted to about five times its volume, and the copper carbonate may be rubbed up with water in a small vessel to form a thin paste. Add this paste to the dilute ammonia by constant stirring. Then add water sufficient to make 50 gallons. Use as promptly as possible owing to rapid evaporation of ammonia.

3. Potassium Sulphide.

Potassium sulphide	6 ounces
Water	100 gallons

This is employed when coloring of foliage is not desirable.

4. Flowers of Sulphur.

Flowers of sulphur (use high-grade) is effective on surface mildews when dusted over the plant when leaves are moist. Sulphuric acid 1-1000 has also proven successful on rose mildew and similar fungi.

5. Copper Sulphate.

Copper sulphate	1 pound
Water	15 gallons

For use on dormant trees or for disinfecting seeds copper sulphate without lime may be employed. The stock may be mixed as for Bordeaux. On growing plants it may be used with a reasonable degree of safety at the rate of one pound to 100 gallons of water.

6. Corrosive Sublimate.

Corrosive sublimate	2 ounces
Water	15 gallons

Corrosive sublimate or bichloride of mercury, one of the deadliest of poisons to animal life, is a very effective disinfectant and fungicide. It is one of the best preventives of potato scab. The above formula is practically a solution of 1-1000 by weight, and is the same strength used by physicians for disinfecting purposes. This is one of the solutions used after pruning for antiseptic dressing of wounds of trees affected with blight. It should be made and kept in wooden or earthen vessels.

7. Formalin.

Formaldehyde vapor dissolved in water in what is usually called the 40 per cent solution is one of the best fungicides and is often used in place of corrosive sublimate. It is also used for treating seed potatoes, oats and wheat. It should be employed in strength of

Formalin	1 ounce
Water	2 gallons

Sulphur sprays given under "Con-

THE LARGER YOUTH'S COMPANION

New Features have been added which will greatly increase the amount of reading and the value of the fifty-two weekly issues of the 1911 volume.

For the Boys

Expert advice on foot-ball, baseball, hunting, fishing—ideas for the young mechanic, etc.

For the Girls

Suggestions for the girl who must make her own way—for the girl at school or college.

For the Family

Practical papers for housekeepers in town and country—ideas for making home more comfortable, more attractive.

"ONLY THE BEST" FOR 1911

50 **STAR ARTICLES**—CONTRIBUTIONS TO USEFUL KNOWLEDGE BY MEN AT THE LADDER'S TOP.

300 **CAPITAL STORIES** — SERIAL STORIES, STORIES OF CHARACTER, ADVENTURE AND HEROISM.

1000 **UP-TO-DATE NOTES** ON CURRENT EVENTS AND DISCOVERIES IN NATURE AND SCIENCE.

2000 **ONE-MINUTE STORIES** — ANECDOTES, CHILDREN'S PAGE, EDITORIALS, MISCELLANY, ETC.

All Remaining 1910 Issues FREE

HOW TO GET THEM

EVERY NEW SUBSCRIBER who at once cuts out and sends this slip (or the name of this publication) with $1.75 for the fifty-two issues of The Youth's Companion for 1911 will receive

ALL THE REMAINING ISSUES FOR 1910, including the beautiful Holiday Numbers for Thanksgiving and Christmas.

THE COMPANION ART CALENDAR for 1911, lithographed in twelve colors and gold. TD 198

Then The Youth's Companion for the fifty-two issues of 1911—a treasury of the best reading for every member of the family.

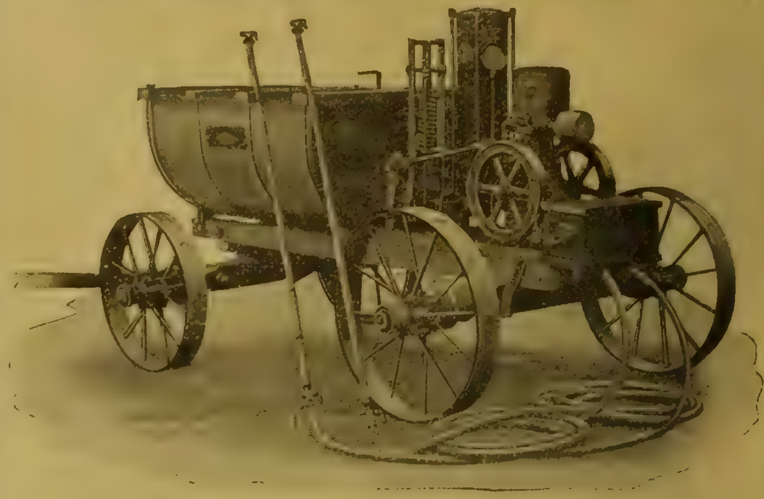
BEAN PONY NO. 140

A Power Sprayer for the Average Grower



A first-class outfit for medium size orchards. It has twice the capacity of a hand pump, supplying two large nozzles at heavy pressure. What's more—it operates at one-eighth the expense of a hand sprayer, not to mention the saving in time and labor.

Built low down—has solid steel platform—and weighs altogether but 1175 pounds. You can haul it anywhere you can take a hand outfit—and it's equally as easy to handle on hilly ground as it is on the level.

Call on your nearest Bean agent, or

Write for our new 1911 catalogue

It tells all about the Bean Pony, the Bean Giant, the Bean Challenge, and all Bean outfits and accessories and describes power sprayers for from $105.00 up.

Free to all who are interested. Ready for mailing Nov. 1.

Plant Health Requires Freedom from Insect and Fungous Pests

tact Insecticides" are also fungicides.

CONTACT INSECTICIDES.

8. Lime-Sulphur.

Quicklime	33 pounds
Sulphur	66 pounds
Water	200 gallons

Sift sulphur through box with screen bottom into boiling tank with 50 gallons of water. Add the lime and boil 45 minutes to one hour. Stir frequently. Strain through cheesecloth or burlap and dilute to make 200 gallons. If extra lime is desired strain in milk of lime when spray is ready for use.

9. Commercial Lime-Sulphur.

The standard strength corresponding to the above formula is obtained when commercial solution is diluted 1 to 11.

10. Lime-Sulphur for Use on Foliage.

Commercial material	1 gallon
Water	30 gallons

Measure the water for the spray into the spray tank and add the lime and sulphur, agitating thoroughly.

11. Self Boiled Lime-Sulphur.

Flowers of sulphur	8 pounds
Lump lime	8 pounds
Cold water	50 gallons

Place the lime and sulphur together in a barrel and add just enough cold water to slake the lime, stirring constantly to prevent burning. Keep a piece of old carpet or burlap sack over the top of the barrel to retain all the heat possible. Watch the mixture carefully and as soon as an orange colored liquid starts to gather on the surface add the rest of the water. Strain through a fine seive to remove the particles of lime, but work all the sulphur through.

Do not use hot water or allow the mixture to stand after the lime is slaked and before dilution. In this spray we do not want the soluble sulphides (orange colored) to form, for these will injure the foliage and fruit.

12. Resin Wash.

Resin	20 pounds
Lye (concentrated)	5 gallons
Fish oil	2½ gallons
Water	100 gallons

Put resin, lye and fish oil, with sufficient water to cover them well, into a large iron kettle and heat until all are well mixed and thoroughly dissolved. Add cold or hot water to make when finished 100 gallons of spraying material. This is one of the oldest sprays and very adhesive. Its great drawback is the time required for mixing and the expense.

13. Distillate Emulsion.

Distillate (28° Baume)	20 gallons
Whale Oil Soap	30 pounds
Water to mix	12 gallons

Dissolve the whale oil soap in the hot water, then add the distillate and stir for a short time while it is still hot. Dilute each gallon of above to 20 gallons with water.

14. Kerosene Emulsion.

Kerosene	20 gallons
Whale oil soap	5 pounds
Water	10 gallons

Dissolve the soap in hot water. Add the kerosene while the suds are still hot (be careful not to get the kerosene too close to the fire) and stir thoroughly. Dilute with cold water 1 to 8.

The emulsions are more satisfactory for hand pumps or even power pumps. They are less injurious to the tree and do not need as much agitation as a tree distillate spray.

15. Distillate.

Distillate 28°, refined for tree use	12 gallons
Water	200 gallons

For use only with power sprayer with good agitator which is necessary to make a mechanical mixture of the oil and water.

16. Distillate-Potash.

Distillate	10 gallons
Lye or caustic soda	5 pounds
Water	200 gallons

Use only with power pump and agitator.

17. Distillate-Tobacco.

Distillate	4 gallons
Black leaf tobacco extract	3 gallons
Water	200 gallons

For thrips and plant lice. To be applied by power outfit with agitator only.

18. Miscible Oils.

Commercial preparations to be used according to directions.

19. Kerosene-Water Mixture.

Kerosene or water white oil	20 gallons
Water	200 gallons

Application by power outfit only.

20. Soap solution.

Whale oil or any good soap	1 pound
Water	6-12 gallons

21. Tobacco.

Tobacco stems	1 pound
Water	4 gallons

Steep tobacco in one gallon hot water. Dilute to 3 or 4 gallons.

or

Black leaf extract	1 gallon
Water	60-70 gallons

22. Sulphur.

(a) Flowers of sulphur	20 lbs.
Hydrated lime	20 lbs.

Thoroughly dust over the foliage, if possible when moist with dew, sulphur mixed with hydrated lime in even parts. The lime is used to increase the adhesiveness, and this has been found fully as effective and more economical than when sulphur is used full strength. If preferred mixed with water, use:

(b) Sulphur	30 pounds
Stone lime	15 pounds
Water	200 gallons

COMBINED INSECTICIDES AND FUNGICIDES.

It is found desirable at times to combat both the insect pests and the fungi at one application of the spray and for this a combination of the insecticide and fungicide is used. This results in a saving in the cost of labor and time spent in spraying.

23. Bordeaux-Arsenate of Lead.

Arsenate of lead	2 pounds
Bordeaux Mixture	50 gallons

or

Arsenate of soda	10 ounces
Acetate of lead	24 ounces
Bordeaux mixture	50 gallons

Prepare the commercial arsenate of lead by working into a smooth paste and add it to the diluted milk of lime. Prepare the home-made arsenate of lead as follows: Take the arsenate of soda and dissolve this in a gallon of water (preferably hot) and in another gallon of water dissolve the acetate of lead. When completely dissolved pour the two simultaneously into the mixing tub containing the rest of the 50 gallons of water; stir well and the spray is ready. The use of wooden vessels is advised in handling these solutions.

Where a stronger poison is desired the arsenate of lead can be increased to 3 or 4 pounds. A more uniform distribution of the arsenate of lead is secured throughout the spray when it is added to the milk of lime instead of placing it in the spray tank.

24. Bordeaux-Paris Green.

Paris Green	4 ounces
Bordeaux Mixture	50 gallons

Mix the Paris green into a thin paste and add to the milk of lime and proceed to mix the Bordeaux according to the directions given in Formula No. 1.

25. Lime-Sulphur and Arsenate of Lead.

(a) Arsenate of lead	2 pounds
Commercial lime and sulphur	1¾ gallons
Water	48 gallons

or

(b) Arsenate of lead	2 pounds
Self boiled lime and sulphur	50 gallons

Have the arsenate of lead in the form of a smooth paste and add to the lime and sulphur solution at the same time stirring the spray thoroughly. If a power sprayer is used it is advisable to keep the agitator working.

POISON INSECTICIDES FOR CHEWING INSECTS.

26. Lead Arsenate.

Lead-arsenate	6—10 pounds
Water	200 gallons

First mix arsenate of lead with two or three gallons of water.

27. Paris Green.

Lime	5 pounds
Paris Green	1 1-3 pounds
Water	200 gallons

28. White Hellebore.

White hellebore	1 pound
Water	50 gallons

Mix the hellebore with a small quantity of water and pour into the spray tank containing the required amount of water.

White hellebore may also be applied as a dust spray by mixing with 5 to 10 parts of flour or road dust, and with this, dust the plants when the dew is on, either early in the morning or late in the evening. White hellebore loses its strength very rapidly when exposed to the air, and should be kept in air tight receptacles. Material carried over from one year to the next is liable to be of little value.

29. Vegetable Bait.

Valuable protection of gardens and low growing plants may be had by use of a vegetable bait which grasshoppers, army worms and similar pests may prefer to the growing crop. This is prepared by spraying a small portion of alfalfa or white clover with a solution of

Paris Green	1 pound
Water	150 gallons.

then distributing where protection is needed, preferably at night as the bait will keep its freshness longer and also because the principal depredations of the pest are at night.

30. Bran Mash.

Bran or flour	10 parts
Paris Green	1 part
Molasses or glucose	2 parts

31. Criddle Mixture.

Paris green	1 part
Salt	2 parts
Horse manure	40 parts

Water to make soft not sloppy. Scatter through grove.

FUMIGATION.

32. Hydrocyanic Acid Gas.

The amount of chemicals necessary for success in fumigation varies according to size of tent, density of foliage and weave of cloth of which tent is made, but approximately we may say that one ounce of cyanide to each 100 cubic feet of space, exposed for one hour, is a reasonably strong dose. For black scales and similar easily killed insects, such a dosage is sufficient, but for purple, red, yellow scale and mealy bug a dose of as much as 1½ ounces to each 100 cubic feet may be necessary. This latter formula will be considered Formula 32a, and the one ounce dose, 32b. The proportions are as follows:

32a Potassium cyanide	1½ ounces
Sulphuric acid	1½ ounces
Water	4½ ounces

32b Potassium cyanide	1 ounce
Sulphuric acid	1 ounce
Water	3 ounces

Water and acid to be placed in vessel under tent or in room and cyanide added only when all is ready to close up the tent as tightly as possible.

33. Carbon Bi-Sulphide.

Carbon bi-sulphide, one pint to each 1000 cubic feet of space. Place liquid in saucers or shallow vessels near top of room or over seed to be fumigated. For underground insects a tablespoonful placed in holes a few feet apart and covered tightly, works satisfactorily. For squirrels place one ounce on a piece of cottom, insert in hole and tamp tightly.

34. Smoke.

For exterminating squirrels, gophers, etc., the use of smoke of common brown paper or old rags pumped into holes with proper appliance accomplishes good results in winter or when ground is wet. Some have found the addition of sulphur to rags or paper increases the effectiveness.

* * *

The calendar which follows gives only the number of the formula which is given in the preceding columns. That is, instead of giving particulars of sulphur-lime wash under "aphis, green" we say "apply 8 or 9," referring to the numbers of those formulas.

APPLES, PEARS, AND QUINCES.

Insect Pests.

Aphis, Green (Aphis mali). Apply 8 or 9 just before buds open, if orchard has been badly infected in past years. Apply 14, 17, or 21 as soon as the insects make their first appearance.

Aphis, Leaf-Curling (of doubtful origin). Same as for Green Aphis.

Aphis, Woolly (Schizoneura lanigera). Spray with 14, 17, or 21 whenever this pest appears above ground. Use at least 150 pounds pressure. For underground forms proceed as follows: Remove soil until upper roots are exposed at the base of the tree. Pour several gallons of 21 around crown and replace soil when it has soaked in. Repeat often.

Bud Moth (Lithophane antennata). Use 8 in winter, and 26 or 27 before leaf buds open and after blossoms fall. Repeat every ten days if necessary.

Brown Apricot Scale (Eulecanium armeniacum). Apply 13, 14 or 15 just as soon as the leaves fall. All applications should be made before Dec. 1st.

Codling Moth (Carpocapsa pomonella L.). Apply 23, 24, 26, or 27 just as soon as blossoms fall. Continue to spray at intervals of ten days or two weeks throughout the season (at least 4 times).

Canker Worms. Fall Canker Worm (Anesopteryx pometaria Harris), Spring Canker Worm (Paleacrita vernata Peck). Apply 26 or 27 when worms first appear. Spray as often as needed. Tanglefoot bands on the tree are very effective in keeping the caterpillars from the trees.

Greedy Scale (Aspidiotus camelliae). Apply 8-10 or 15 when trees are dormant. This scale seldom needs treatment.

Oyster Shell Scale (Lepidosaphes pomorum). Apply 8-10 when trees are dormant.

Pear Slug (Selandria cerasi Peck). Dust on Paris Green, Hellebore or Pyrethrum.

San Jose Scale (Aspidiotus perniciosus). Apply 8-16 when trees are dormant. If 9 is used be sure it is no weaker than given. Repeat in spring.

Tussock Moth (Hemerocampa leucostigma S. & R.). Pick off eggs several times during the winter. When young caterpillars appear jar from the tree, and apply tanglefoot band one foot below fork.

Fungoid or Bacterial Diseases.

Black Spot Canker (Myxosporium curvisporum Sacc.). Apply 1-a. the first and 15th of November.

Bitter Rot (Glomeralla ruformaculans). Apply 1-b. or 2 at first appearance of rot. Repeat every two weeks if needed.

Moss 'or Lichens. Apply 1-a, 8 or 16 when trees are dormant.

Powdery Mildew (Podosphaera oxycanthae). Apply 1-a when trees are dormant, then 1-b during spring and early summer. Remove mildewed tips in winter. Apply 8 just before buds open.

Sappy Bark. Cut away diseased parts when trees are dormant.

Scab (Venturia inaequalis, Winter). Apply 1-a before buds start. Spray again with 1-b as soon as blossoms fall. Repeat several times at intervals of three or four weeks. (This should be done especially if the weather is damp.)

CITRUS FRUITS.

Insect Pests.

Black Scale (Saissetia oleae) Fumigate with 32-b during period between September 1st and January 1st. Spray young trees with 12-15 during the months of September, October and November. Remove Nightshade from orchard before fumigation to prevent reinfection. Fumigate also olive trees or oleanders which may be near your orchard.

Chaff Scale (Parletoria pergandii). Fumigate with 32-b at any season.

Fuller's Rose Weevil (Aramagus fulleri). This insect cannot fly and can be kept from the trees by means of tanglefoot bands.

Hemispherical Scale (Saissetia hemispherica). Same as for Black Scale.

Long Scale (Lepidosaphes gloverii). Fumigate as soon as found with 32-b. Repeat if living forms are found a month later.

Mealy Bugs: Long Tailed Mealy Bug (Pseudococcus longispinus); Citrus Mealy Bug (Pseudococcus citri); Fumigate as soon as found with 32-b applied as follows: Give regular dose and at the end of one hour's exposure repeat the dose and expose for another hour, thus making the dose twice 32-b and the entire exposure two hours.

Oleander Scale (Aspidiotus hederae). Fumigate with 32-a. Not a serious citrus pest.

Orange aphis (Aphis citri, Ash.). Spray with 14 or 21 as soon as found.

Purple Scale (Lepidosaphes beckii). Fumigate with 32-b as soon as located and repeat in one month if necessary.

Red Scale (Crysomphalus aurantii). Treat same as Purple Scale.

Red Spider (Tetranychus mytilaspidis). Apply 22-b when foliage is damp. Repeat until pests disappear.

Yellow Scale (Chrysomphalus aurantii citrinus). Treat same as for Purple and Red Scale.

White Cottony Cushion Scale (Icerya purchasi, Mask.). This pest is handled perfectly by its natural enemy, Novius cardinalis, commonly called the "Vedalia," which may be had from the State Insectary, Sacramento. Release colony at any time of year scale appears.

White Fly (Aleyrodes citri). Defoliate trees when the larvae appear and scrub with 16 or 20. Better to fumigate with 32-a.

Thrips (Euthrips citri). Spray with 17 in spring.

Army Worms (Various species). Apply 30 under trees; also if they have not already secured access to orchard, surround trees with deep furrow, vertical side toward trees. If cover crops are growing, remove such growths as project up into branches of the trees. Paint tanglefoot bands around tree trunk.

Fungoid and Bacterial Diseases.

Brown Rot (Pythiacystis citrophthora). Sow cover crop in orchard. Plow under in spring and cultivate well under the trees. In washer use 7, bluestone, or permanganate of potash. Eliminate infected fruit and disinfect boxes and picking sacks.

Dieback (Bacterial). Improve physical conditions of trees by deeper and more thorough tilling of soil. If excessive applications of nitrogenous fertilizers have been made, discontinue until tree has resumed normal conditions.

Gum Disease, Mal-di-goma. Scrape gum from diseased parts. Apply neat's-foot oil and improve physical conditions of the tree by deep culture of the soil. If soil about the trunk roots is compact and excessively hard, remove and substitute sand or loose soil.

Mottle Leaf (Physical). Improve physical condition of tree by deep culture. Make applications of lime and manure to soil. Examine soil as to hardpan, and if it exists, break up if possible.

Smut (Meliola camelliae, Sacc.). A fungous growth caused by honey dew exuded by scale insects, plant lice and white fly. Remove pest and smut will disappear.

Wither Tip (Colletotrichum gloeosporioides, Penz.) Apply 1-a as soon as it appears and repeat as often as necessary.

PEACH, NECTARINE, AND APRICOT.

Insect Pests.

Aphis, Black Peach (Aphis persicaeniger). For those above ground use 14 or 21. Destroy the underground forms by pouring carbon bi-sulphide into holes in the ground (made by a crowbar) six inches to six feet away from the tree and about two feet apart. Pour 21 around base of tree often.

Apricot Scale (Eulecanium armeniacum). Apply 13, 14, or 15 just as soon as the leaves fall. All applications should be made before the first of December.

Black Scale (Saissetia oleae). Same as Apricot Scale.

Borer, Peach Tree (Sanninoidae exitiosa, Say). Dig out and kill, or

PLANT NOW for your fall and winter garden. To make a success with your garden use **Morris & Snow Seed Co.'s Pedigreed Seeds.**

Wet your ground well and get it ready for Cabbage, Cauliflower and Onion seed-beds. We recommend our French grown **Winningstadt Cabbage, California Pearl Cauliflower** and **Early White Queen** and the **Bermuda Onions** as the best varieties for shipping and marketing.

We make a specialty of **Flower Seeds.** New Crop **Pansies** and **Ten Weeks Stock** are now in also. **Winter or Christmas-Flowering Sweet Peas** in variety.

destroy by inserting a flexible wire into their burrows.

Bud Moth (Lithophane antennata). Use 8 during winter months when tree is dormant. Use 26 or 27 just before leaf-buds open and just after blossoms fall. Repeat every ten days if necessary.

San Jose Scale (Aspidiotus perniciosus). Spray with 8-16 when trees are dormant .

Twig Borer (Anarisa lineatella). Spray with 8-10 just when the buds are swelling.

Fungoid and Bacterial Diseases.

Blight, Peach (Coryneum beyerinkii). Spray last of November or before December 15th with 1-a, 8, or 9.

Curl Leaf (Exoascus deformans, Fuckel). Spray thoroughly with 1-a, 8-10 just before buds begin to open. Later sprayings should be made with 1-b.

Shot-hole Fungus (Coryneum sp?). Spray with 1-a about 10 days before buds open and with 1-b when fruit is about one-fourth grown.

Yellows. Dig out trees when found infested. Be sure and take out one or two feet of the infested roots.

CHERRIES, PRUNES, PLUMS.

Insect Pests.

Cherry Slugs (Eriocampoides limacina and Eriocampa cerasi). Feed upon the upper surfaces of the leaves exposing the veins. Spray with 26 or 27 or dust 28 liberally upon the trees as soon as slugs appear.

Prune Aphis (Aphis prunifolii). Spray in the fall with 8, 9, 10, or 11 and as soon as the lice appear with 14 or 21.

Black Peach Aphis (Aphis persicae-niger Sm.). See same under Peach.

Peach Root-Borer (Sanninoidea opalescens). See same under Peach.

Canker Worm (Paleacrita vernata abd Alsophila pometaria). See same under Apple.

Tent Caterpillar (Malacosoma disstria). See same under Apple.

Brown Day Moth (Pseudohizis elanterina). Attacks particularly the prunes and cherries. Spray with 26 or 27 as soon as larvae appear.

Red Hump (Schizura concinna). Spray early with 26 or 27. Burn cocoons.

Fungoid and Bacterial Diseases.

Brown Rot or Fruit Mold (Sclerotinia fructigena Sch.). Produces a rot on the fruit. Spray with 1-a early in the spring, and with 1-b as soon as the buds begin to open.

Leaf Curl of Witches Broom (Exoascus cerasi Fuckel). Cut out and burn infested parts. Spray with 1-a early, and with 1-b as soon as the buds begin to swell.

Leaf Spot or Shot Hole Disease (Cylindrosporium padi Karst). Produces a shot-hole effect upon the leaves. Spray in early spring with 1-a, when the buds begin to open with 1-b, and when the fruit is one-fourth grown with 1-b.

Powdery Mildew (Podosphaera oxycanthae DC.) Appears on the leaves late in the season. Spray as soon as found with 1-b and repeat if necessary.

Crown Gall (Pseudomonas tumefacieus Erw. Smith & Town.). Causes a large gall or swelling at the crown of the tree. Remove gall and treat exposed part with 1-a. Select only healthy nursery stock. Do not injure base of trees.

Gummosis. Dig out the gum pockets and wash out with 1-a.

GRAPE.

Insect Pests.

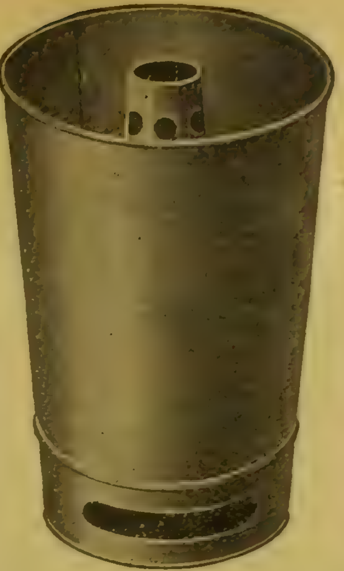
Grape Phylloxera (Phylloxera vastatrix). Attacks roots and foliage of of the vines. Plant resistant stock. Be sure of your nursery stock.

Vine Hopper (Typhlocyba comes Say). Infests foliage of the vines. Use hopper-doser in spring before adult females deposit their eggs. Spray as soon as the young begin to appear with 13 or 14.

Grasshoppers (See same under Beans.)

California Root Worm (Adoxus obscurus L.). A black beetle whose larvae attack the leaves, stems, petioles, roots and fruit of the vines. Cultivate deeply around the base of the vines. Spray with 26 or 27 as soon as beetles appear.

Imported Grape Root Worm (Adox-



The Troutman Orchard Heaters
Will Give You Absolute Protection From Frost.

Orchard heating eliminates the one great uncertainty in fruit growing, and is the greatest insurance agency on earth.

The Troutman Heaters are the WORLD'S STANDARD OF EFFICIENCY AND ECONOMY.

They are built on the scientific principle, and give more heat for the oil consumed than any other device.

They save 50 per cent of fuel and labor.

Special Prices Until November 15th.

Representing the four counties of Los Angeles, Orange, Riverside and San Bernardino.

The LaVerne Rotary Cultivator

The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

"Flour City"
Gasoline Traction Engines

Made in 30 and 40 H. P.
Gold Medal Winner
1908 and 1909

The "Flour City" 4-cylinder engine was entered in the International Motor Contest at Winnipeg, in July, 1908, in competition with the leading engines manufactured in this country and England and was awarded first prize—a gold medal—for plowing more land and hauling a greater load in a given time, with less water and fuel consumption, than any of its competitors. It was again entered the following year and again carried off first prize.

The "Flour City" has four cylinders, vertical, giving an absolutely steady pull on the draw bar. We have sold a number of these engines, and they are giving splendid satisfaction.

We now have these engines at our store in Los Angeles where we would be pleased to show them to prospective purchasers.

Be sure and see the "Flour City" gasoline traction engine before buying.

us vitis Fou.). A brown beetle working the same as the California form and is controlled in the same manner.

Flea Beetle (Haltica carinata Germ.) Found very abundant in the vineyards near Cucamonga, Cal., during the year 1908. It infests the foliage and may be handled by spraying liberally with 26 or 27.

Hawk Moth (Philampeles achemon Drury). The large green larvae of this moth feed upon the foliage. Hand pick, or if too numerous spray with 26 or 27.

Grape Leaf Folder (Desmia funeralis Hub.). The larvae roll themselves up in the leaves which they eat. Spray with 26 or 27.

Other Pests.

Erinose (Eriophyes vitis). This so-called disease is produced by a small mite, which is characterized by forming swellings upon the upper surfaces of the leaves. Dust plants liberally with 4 when they are wet with dew.

Nematode Root Gall (Heterodera radicola Mull.). A minute worm attacking the small roots. Destroy all infested vines. Sterilize soil with 33. Plant only hardy varieties where this exists.

Fungoid and Bacterial Diseases.

Powdery Mildew (Uncinula spiralis and Uncinula necator Schw.). Grows upon the canes, leaves, and fruit. Dust often with 4 as soon as the disease appears. Spray early with 1-a.

Downy Mildew (Peronospora viticola DB.). Attacks all green portions of the plant—leaves, young shoots, and berries. Spray with 1-b as soon as first appearance is made.

BLACKBERRIES, RASPBERRIES, LOGANBERRIES, STRAWBERRIES.

Insect Pests.

Rose Scale (Aulacaspis rosae Bouché). A white scale thickly infesting the canes just above the surface of the ground. Spray with 8, 9, 12, 13, or 15.

San Jose Scale (Aspidiotus perniciosus Comst.). A small scale badly infesting the canes particularly of the raspberry. Spray with 8, 9, or 11.

Rose Chafer (Macrodactylus subspinosus Fab.) Appears about June 1st, when the plants begin to blossom. Destroys particularly the blossoms, and due to its great numbers, it is a very difficult insect to control. The following should be observed, however: Spray with 26 or 1-a as soon as the first beetles appear. Clean out all weeds or other plants which may afford breeding places. Hand pick when they first appear.

Strawberry Plant Louse (Myzus fragaefolii Ckll.). A light yellow louse attacking the buds, blossoms and young fruit. Spray with 14 or with 21.

Fungoid and Bacterial Diseases.

Orange Rust (Gymnoconia peckiana Tranz.). Forms orange-red colored masses on the leaves, which finally kill the plant. Dig out and burn all diseased plants as soon as rust first appears.

Leaf Spot of Blackberry and Raspberry (Septoria rubi West.). Produces small pale spots on the leaves. Spray with 1-b when leaves are half-grown and repeat every 2 weeks if necessary.

Leaf Spot of Strawberry (Mycosphaerella fragariae Lind.). This disease first appears as small discolored spots upon the leaves which destroy the tissues of the plant. Spray before the flowers open with 1-b. If the disease apears late, mow off and burn the leaves. Spray the newly appearing leaves with 1-b.

Powdery Mildew of the Strawberry (Sphaerotheca humuli). Produces a whitish powdery covering on the foliage which soon kills the plant. Dust with 4 when the plants are wet, or spray with 6.

Crown Gall (Pseudomonas tumefaciens Erw.). Affects, especially, the blackberry. Dig vines as soon as this trouble appears; there is no cure. Secure new, clean stock and plant on fresh ground.

CURRANTS AND GOOSEBERRIES.

Insect Pests.

San Jose Scale (Aspidiotus perniciosus Comst.). A small scale infest-

ing the stalks. Spray anytime with 8, 9, or 11.

Currant Stem Borers (Sesia tipuliformis and Chrysobothris femorata). Small white larvae which bore into the stalks of the plants. As a preventive, wash plants in the spring with 20.

Imported Currant Worm (Nematus ventricosus Klug.). Attacks the leaves in the spring. Dust plants with 27 or 28 when they are wet, or spray with same.

Leaf Hopper (Empoasca albopecta Walsh). Usually appears in great numbers on the undersides of the leaves. Spray with 14 as soon as the first ones are noticed.

Currant Leaf Louse (Aphis ribis). Usually works upon the ends of the tender shoots and stunts their growth. Spray with 14 or 21.

Fungoid Pests.

Leaf Spot (Septoria ribis Desm). Produces large pale spots with brown borders upon the leaves. Spray with 1-b as soon as first spots appear and repeat as often as is necessary to keep down the disease. Spray with 1-b twice after fruit has been removed.

Anthracnose of Currant (Pseudopeziza ribis Kleb.). Produces small brown spots upon the leaves, petioles, young canes, fruit stalks, and fruits. Spray with 1-a before leaves appear and with 1-b while leaves are unfolding and repeat every three weeks until fruit ripens.

Gooseberry Mildew (Sphaerotheca morsuae B. & C.). Produces a mildew upon the stems, leaves, and particularly upon the berries, causing them to spoil. Spray with 1-b just as the buds are breaking open and repeat every 12 days until about July 1st. Spray plants in winter with 8, 9, or 11.

PEAS, BEANS, VETCH, CLOVER, ALFALFA.

Insect Pests.

Wireworms (Various species). Affect beans and many other garden plants. Rotation of crops to starve out the infestations is perhaps the best treatment. Where this cannot be done, the use of Carbon bisulphide in sandy ground is advised. Fertilize with Nitrate of Soda or Kainit.

Bean Aphis (Aphis rumicis L.). Works on the leaves, young shoots and tender pods causing much damage. It is usually cared for by an internal parasite and by a predacious Ladybird, but if it becomes too destructive spray with 14 or 21.

Green Pea Aphis (Siphonophora pisi). Also attacks vetch, geraniums, malva, and many other plants. Spray with 14 or 21.

Cut Worms (Peridroma saucia, Agrotis ypsilon). Do great damage to all crops at certain seasons. Plow around field so as to have straight side of furrow next to the crop. Poison with 29, 30 or 31.

Grasshoppers (Various species). Are very difficult to handle. Poisoned baits as given in 29, 30 and 31 have given good results.

Weevils:

Bean Weevil (Bruchus obtectus Say).

Pea Weevil (Bruchus pisorum L.). Fumigate seed with 33 and be sure that no infested seed is planted. Test by placing in water; infected seeds will float.

Fungoid and Bacterial Diseases.

Bean Anthracnose (Colletotrichum lindemuthianum B & C.). Produces brown sunken areas upon the pods. It also attacks the young plants. Treat seeds with 7 before planting. Spray with 1b as soon as young seedlings are well under way. Repeat if necessary. Practice clean cultural methods.

Bean Blight (Bacillus phaseoli). Attacks pods and produces wrinkled and distorted seed. Treat seed with 7 before planting.

Rust (Uromyces appendiculatus Lev.). Produces rust colored spots on foliage. Spray with 1-b. Burn all infested plants.

Downy Mildew (Phytophthora phaseoli Thax.). Turns foliage dark and causes it to wilt and die. Select clean seed. Spray with 1-b.

Downy Mildew of Alfalfa (Peronospora trifoliorum). Spray with 1-b or dust with 4.

Pea Mildew (Erysiphe polygoni

CYANIDE guaranteed 98-99% for generating HYDROCYANIC ACID GAS

The only positive eradicator of the **San Jose Scale, Red** and **Black Scale** and other insect pests.

FOR SALE BY

The Braun Corporation, 363-371 New High St., Los Angeles, Cal.
The Braun-Knecht-Heimann Co., 576 Mission St., San Francisco, Cal.
Haas, Baruch & Co., Los Angeles, Cal.

DC). Appears early and late, covering plant with a white felt-like powder. Spray with 1-b or dust with 4.

ONIONS, LEEKS, GARLICS, ETC.

Insect Pests.

Onion Thrips (Thrips tabaci Lind.). Attack the leaves and flowers causing considerable damage in some localities. Spray with 14 as an insecticide and with 1-b as a repellent.

Cutworms. See Beans, Peas, etc.

Fungoid Diseases.

Downy Mildew (Peronospora schleideniana DB). Produces a white mould on the leaves causing them to wilt and die. Spray with 1-b.

Onion Smut (Urocystis cepulae Frs.). First appears in the form of dark spots upon the leaves and later as longitudinal rifts upon the bulbs. The following drilled into the soil at the rate of 150 lbs. per acre has given good results: lime 50 lbs. mixed with sulphur 100 lbs. Also treat seed with 7 as they are being drilled into the soil.

CABBAGE, CAULIFLOWER, KALE, TURNIP, RADISH, MUSTARD.

Insect Pests.

Harlequin Cabbage Bug (Murgantia histrionica Hahn). Attacks all cruciferous plants, cultivated and uncultivated, as well as many other hosts. It is no little difficulty to keep these insects from taking a crop, but by observing the following they may be held in check: keep weeds from the fields at all times: plant late trap crops of kale or cabbage and burn them when they become infested, or kill the bugs with pure kerosene. Hand pick adult insects as soon as they first begin to appear. Spray with 14.

Cabbage Aphis (Aphis brassica). Attacks a wide range of cruciferous plants, cultivated and uncultivated. In time, it is subdued by parasitic and predacious enemies, but often not until it has done great damage. It can be controlled by spraying with 14 or 21.

Cabbage Worms (Larvae of Pieris brassicae, the Large White Butterfly, and of Pieris rapae, the Small White Butterfly). These green worms do great damage by destroying, for market, great quantities of cabbage and cauliflower. The State Insectary is at present propagating a very efficient parasite which destroys the chrysalid of this insect. As a repellent apply 28; as an insecticide apply 12.

Cut Worms. (See same under Beans, Peas, etc.).

Fungoid and Bacterial Diseases.

Club Root (Plasmodiophora brassicae Wor.). A disease producing a peculiar enlargement of the roots giving the plants an unhealthy appearance and finally causing their death. The disease may be carried over in the soil, so the following has been recommended as a means of control: lime the soil at a rate of 100 bushels per acre, every few years. Rotate crops. Employ clean culture methods.

Black Rot (Pseudomonas campestris Smith). A bacterial disease first producing a burnt margin on the leaves and finally causing them to drop. The disease is readily carried from year to year in the seed. Before planting treat the seed with 6 or 7. Eliminate infected plants as soon as they appear in the beds. Rotate crops.

TOMATO, POTATO, EGG-PLANT, TOBACCO, ETC.

Insect Pests.

Tomato Worms. (Are the larvae of two Sphynx Moths, Plegethontius quinquemaculata How. and Plegethontius sexta Joh.). These large green caterpillars feed upon the foliage and are easily recognized. Due to their large size, it is very effective to hand pick the infested area. If very numerous spray with 26 or 27.

Flea Beetle (Epitrix parvula Fab.). A very small beetle which works on the leaflets. As a repellent spray with 1-b; for an insecticide 26 or 27.

Twelve Spotted Cucumber Beetle (Diabrotica soror Lec.). A small green beetle with 12 black spots on the elytra. The larvae work on a great variety of plants. Spray with 26 or 27.

Tobacco Worms:

Northern or Horn Worm (Protoparce celeus).

Southern (Protoparce carolina).

Resemble greatly the tomato worms in appearance and in their work. The methods of control are the same.

Cutworms. (See Beans, Peas, etc.).

Fungoid and Bacterial Diseases.

Winter Blight or Downy Mildew (Phytophthora infestans DB.) Attacks nearly all of the plants of this

CAPITO-BLYTHE CO.
(INCORPORATED)
124 S. Los Angeles St., Los Angeles, Cal.

family, killing the leaves and injuring the tubers. Plant clean seed. Disinfect doubtful seed with 7. Spray plants with 1-a as soon as symptoms first appear.

Root and Stem Rot (Corticium vagum var. solani Burt.). Causes a "damping-off" of seedlings. Also attacks the tubers of potatoes, the subterranean parts of the tomatoes, and the fruits touching the soil. Apply lime to aerate the soil. Rotate crops.

Dry Rot of Potatoes (Fusarium oxysporium Schl.).

Wilt of Tomatoes (Fusarium lycopersici Sacch.).

Wilt of Egg-plant (Fusarium sp.?).

All of these diseases produce a wilt upon the host plants, affect the roots, and may even cause a "damping-off" of seedlings. Treat seed with 7 before planting. Keep weeds out of fields in winter. Rotate crops, so as to have clean soil each year.

Early Blight (Macrosporium solani E. & M.). A typical leaf-blight causing brown spots to appear on the foliage. Affects potatoes, tomatoes and daturas. Spray with 1-a when the plants are six inches high and repeat with 3 applications 2 weeks apart. Treat seed with 7 before planting. Rotate crops.

Potato Scab (Oospora scabies Thax.). Produces large rough blotches on the tubers. This disease cannot be dealt with while the plants are growing. Great care must be exercised in the matter of seed selection. Treat all seed of doubtful origin with 7. Rotate crops so as to keep the soil fresh.

SQUASH, PUMPKINS, CUCUMBERS, MELONS, ETC.

Insect Pests.

Melon Aphis (Aphis gossypii Glov.). Attacks all parts of the vines and is usually accompanied by a black smut, which grows upon the honey-dew secreted by the louse. Spray with 14 or 21.

Cucumber Beetles, Striped (Diabrotica vittata Fab.).

12-spotted (Diabrotica soror Lec.). The larvae and adults of these beetles destroy flowers and foliage of the plants and gnaw the rinds of the fruit. Methods of control are as follows:

Repellents—Dust with 21 or with Naphthalene. Soak lumps of gypsum in a mixture of kerosene and turpentine and place them under infested vines. Insecticides—Dust with lime and then spray or dust with 27, or spray with 26.

Squash Bug (Anasa tristes DG.). Hand pick early in the season; also pick off eggs and destroy. Eggs are deposited in clusters on the leaves when the vines are very young. Trap bugs by laying boards loosely on the ground under which they crawl for protection. If very troublesome a repellent of gypsum saturated with kerosene scattered about the grounds is effective. As soon as crop is harvested, gather and burn vines. Do not allow weeds to grow on the ground during winter months.

Fungoid and Bacterial Diseases.

Downy Mildew (Pseudoperonospora cubensis Rost.). Disease first appears in the center of the vine and spreads outwardly. Spray with 1 b to which is added 1 gal. of sulphurous acid to every 100 gallons of spraying material. Repeat every 10 days.

Leaf Blight (Altenaria brassicae nigrescens Pegl.). Produces spots on the leaves which spread very rapidly. This disease hastens ripening, injures production, and destroys the quality of the fruit. It particularly affects cantaloupes. Destroy affected plants as soon as they first appear. Spray often with 1-b. Rotate crops.

Anthracnose (Colletotrichum lagenarium E. & H.). Forms circular dead spots on the leaves and long shrunken areas on the stems. The fruits of the watermelon are often badly spotted by this disease. Spray with 1-b as soon as fungus appears.

Common Wilt (Bacillus tracheiphilus Erw. Sm.). Produces a sudden wilt of the vines by stopping up the water-carrying vessels of the stems. Destroy infected plants as soon as infection appears.

Fusarium Wilt (Neocosmopora vasinfecta var. nivea). Can be handled only by crop rotation.

Powdery Mildew of the Cucumber (Erysiphe polygoni D C.). Attacks other members of this group also. Forms a white powdery coating on the leaves and stems and soon kills the plants. Spray as soon as it first appears with 1-b.

CELERY, CARROTS, PARSNIPS.

Insect Pests.

Celery Leaf-tyer (Phlyctaenia ferrugalis Hbn.). Destroys foliage, and its presence may be told by the many leaves which are curled and fastened together by this insect. It is particularly bad in greenhouses. Spray with 26 or 27 not later than 3 weeks before marketing crops, because of the danger of poisoning. Hand pick.

Viridescent Leaf-hopper (Empoasca viridescens Walsh). Use hopper doser in large fields or spray as soon as insects first appear with 14.

Cutworms. (See same under head of Beans, Peas, etc.)

Fungoid Diseases.

Celery Blight, Early Blight (Cercospora apii Fr.). Produces spots upon the leaves causing them to turn yellow, to wilt, and finally kills them. This disease also affects parsnips, and usually appears early in the season. Spray early and repeatedly with 1-a or with 2.

Late Blight (Septoria petroselini var. apii B. & C.). Produces rusty brown spots upon the leaflets which may rapidly spread to cover the entire foliage. Spray with 1-a throughout the season.

ASPARAGUS.

Insect Pests.

Asparagus Beetle (Crioceris asparagi L.). Dust air slacked lime upon the plants when they are wet with dew. Apply 26 dry. As a repellent spray with 28.

Fungoid Diseases.

Asparagus Rust (Puccinia asparagi DC.). Attacks the bushy tops, producing black and red rust, the latter being the destructive stage. Keep the plants cut back until July 1st. Apply 150 to 200 lbs. of 22 dry per acre, three weeks after cutting tops and before rust appears. Make the applications in the morning when the plants are wet with dew, or first spray with 1-b.

The Family Orchard

Special attention to the selection of suitable varieties.

Leonard-Coates Nursery Co., Inc.
MORGANHILL, CAL.
New catalogue ready

CORN, SORGHUM.

Insect Pests.

Corn Worm (Heliothis armiger). Is hard to deal with because it works on the ear in the husk. It is best handled by the rotation of crops, late plowing followed by harrowing to destroy the pupae in the soil, and by planting crop as early as possible to assure rapid growth.

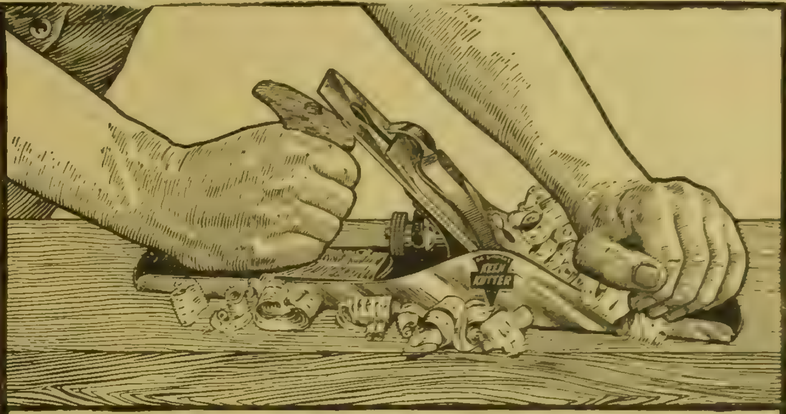
Corn Root Aphis (Aphis maidi-radicis Forbes). Attacks the roots causing a dwarfing of plants in patches over the fields. Crop rotation is the most important method of control. Stir old corn ground thoroughly before planting it again to corn.

Wire Worms (See same under Beans).

Fungoid Diseases.

Smut (Ustilago zeae Ung.). Causes enormous enlargements of the kernels, producing large sacs of smut. Cut off and burn the first infestations. Treat seed with 7 before planting. Rotate crops.

Wilt of Sweet Corn (Pseudomonus stewarti Erw. Smith). Plants die by wilting due to the shutting off of the water supply. Select resistant stock. Treat seed with 7 before planting. Rotate crops.



Quality in Tools

Tools for the workshop, farm or home must be tools of quality. A plane, for instance, to smooth a board properly, must have a keen blade, carefully adjusted—its surface must be true and it must fit the hand.

KEEN KUTTER
Tools and Cutlery

are carefully inspected, adjusted and tested before leaving the factory.

Look for the Keen Kutter trademark on every tool you buy—it guarantees the tool to be satisfactory or money refunded.

The name Keen Kutter covers a full line of tools for shop, garden and farm, as well as scissors, shears, pocket knives, razors and table cutlery.

If not at your dealer's, write us.

Wood Soled Boots and Shoes

Creamerymen, Milkers and Farmers

Write us for prices and descriptive circular of our line of wood soled boots and shoes. We carry the very best goods made in this line. The uppers are made of the best quality of Milwaukee oil grain leather. The soles are well shaped, comfortable, and fit as well as all leather boots or shoes.

We all know wood is a non-conductor, consequently it is much drier and a great deal warmer in winter. They are lighter than Rubber or Leather Shoes and Boots. Shoes, $2.10; Boots, $3.75; Rails 25c pair extra. The wood-soled boots are an absolute safeguard against rheumatism, as they keep the feet dry both summer and winter.

Clip Your Horses Yourself

Stop paying high charges for work that you, or any man or boy, can do. There's no need to employ experts to clip your horses when you can clip them **yourself better, quicker, cleaner, safer and cheaper** with a

Stewart No. 1 Ball Bearing Horse Clipping Machine

It's an economy for the man who owns one or more horses. For, with a **STEWART**, there are no delays. The machine is **always** ready for use. Horses can be clipped more frequently and at **Regular Intervals**. The **STEWART** is *the* machine that lasts indefinitely and gives good service *all* the time. It never requires attention, and runs practically without friction or wear. A tremendous speed of the knives is obtained by slowly turning the handle—and a boy can turn the handle. (Another boy can clip the horse.) **Complete for $8.50.**

The price is for the machine ready to begin clipping horses with. It includes six feet of flexible shaft, the famous Stewart Clipping Knife and a liberal guarantee. Get one at your dealer's. If not there, write us.

CHICAGO FLEXIBLE SHAFT CO., Dept. H CHICAGO

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

MAKING THE DAIRY PAY.

By Mrs. M. E. Sherman.

Success in any branch of live stock raising seems to depend on the man more than on any other one thing. I know men that have made good on common cattle, while others have made complete failure with the best of cows. Scrub brains will fail to find profit in the dairy if the finest cows in the world are put under their care for any length of time. It seems as if success in cattle or in any stock raising was not a matter of education, but of natural aptitude; for some of the men that I have employed that could hardly be considered bright, always had the cattle in thriving condition.

Prices.

The high price of butter is holding a number of dairies in business that are just able to live. I look to see in the near future many cows going to the butchers. The least drop in prices will certainly cull them out. That is one of the difficulties of all farming business, let it become unduly profitable to those already in the field and at once it is filled with a lot of people, who quickly bring down the prices. The law of competition always seems to work in the farmer's markets and they never take the step further to combination. It is a pity that neighbors can not trust each other when they will trust the bank or any other institution that is composed of men as honest from policy and as honorable from principle as their neighbors.

Time To Cull.

This is the time for culling out the poor cows. With butter fat at thirty to thirty-six cents a pound, the poorer cows can be dropped without feeling it in the creamery check. No cow should be kept that will not bring in ten dollars a month at present prices. She ought to do better than that. As long as the poorest cows are kept in the herd, the actual tendency is downward. The dropping from age and losses from disease or injuries is not lessened and there is nothing to increase profit. This is coming more and more to be realized by the commercial dairymen. The men that are buying registered cattle today are not the wealthy men that made it a fad some years ago, but the regular dairymen. I have noticed the great number of Swiss names among the transfers of cattle made in California by the associations and clubs within the past year. This is wise, for the uselessness of a poor cow was never more fully shown than at present, yet the temptation to hold her until the next calf is often too great.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Babcock Testing.

I am glad that the boys are being taught in the Fresno schools to test cows. It will not be long before their services will be available to help the dairymen. I know of nothing that would help a boy more than this knowledge on the road toward being a practical dairyman. I hope to see the boys using their Friday evenings and Saturday mornings in making tests for the farmers. It could be made a paying business. The small hand-testing machines cost only a little. In buying, however, it is well not to have too small an outfit or the work becomes tedious. The six-bottle sizes are catalogued at nine dollars, while the twelve-bottle size is quoted at fourteen. They are good iron framed machines. They come cheaper in the lighter makes but are not as durable.

Figuring it Out.

Take a pencil and figure out the actual cost of the cows in the herd as a basis from which to cull out. This is done somewhat after this manner. One milker milks twenty-five cows. As he feeds the calves too, this item can not be separated very well, so we will consider the cows as good mothers, willing to carry this cost. The milker's wages are forty dollars a month and his board fifteen, making him cost fifty-five dollars. Feeding: Alfalfa hay ten pounds, and silage forty pounds, costs four and a half cents a day, grain five cents, waste half cent, making a total for feed of ten cents a day per head, or three dollars a month. While in the winter it may run a little over this, I do not think by the year that this is too little. Ten cents a day for feed, or thirty dollars a month, cost of milking two dollars and eighty cents, cost of stable cleaning and gypsum in stables one dollar a month, total of six dollars and eighty cents a month evpenses for each cow.

Returns.

Now if the cows are giving a pound of butter fat a day, at thirty-four cents, we have ten dollars and twenty cents total from fat, or a profit of three dollars and forty cents for butter fat alone. The twenty-five cows should produce one hundred gallons of milk a day or about seven hundred and fifty pounds of skim milk. At the present price of grain this is worth twenty cents a hundred or one dollar and a half a day, or about six cents a cow. The amount of butter fat has not been made high and there are common cows around us doing this well at the creameries. The carefully selected herd of dairy cows will do better than this. The calf is not counted in this as a return. If added to the cow's account it brings it up a little. If the stock is full-blooded registered stock, the calves can be counted at $100 each when yearlings. After the expense of raising them is taken out, as well as registering them, it leaves about seventy dollars to add to the cow's account.—M. E. Sherman.

No other branch of agriculture presents more advantages than dairying—disposing of the products of the farm as milk and butter-fat. When the latter may be sold to creamery stations and the skim milk fed to calves and pigs along with alfalfa the profits are greater than from almost any other form of agriculture. No other business tends so rapidly to build up the fertility of the farm, and, when judiciously conducted, no other branch of farming yields more satisfactory financial returns. Raising and feeding alfalfa will add from 15 to 30 per cent to the profits of dairying over the use of any other feedstuff that may be raised or bought. The profit problem for the dairyman is constantly to find the feed that will decrease the cost of his production.—From Coburn's "The Book of Alfalfa."

POPULAR POLAND CHINAS.

Among California breeders the Poland China breed of hogs is quite as popular as it is in the Ohio Valley, where history places its origin and development. Describing it, Coburn in his "Swine in America" says that it is a large breed hog, weighing at maturity, alive, 500 to 1,000 pounds. It has reasonably early maturity and is much liked throughout the corn-producing sections of the United States. For crossing by other breeds the Poland-China sows have a popularity not surpassed by those of any other. They have the hardiness, docility and good feeding qualities that breeders like, and Poland-China sires transmit these qualities to their get from sows of any breed. For these reasons by far the greater part of the marketed hogs in the United States have Poland-China blood.

In some ways the refinement of this breed, or rather families of it, has been carried too far, and their breeders are severely criticized for overdeveloping fanciful points to the exclusion or neglect of others more important, resulting in diminished size, vigor and prolificacy; but the tendency at the present writing is to guard against or overcome this by more intelligent management.

Prior to about the year 1870 the Poland-Chinas averaged larger than now, were inclined to coarseness, or sponginess of bone, had much heavier, drooping ears, and were spotted with about even proportions of black and white. Since then the tendency has been to breed them with more black, until now those in highest esteem have identically the color and markings so long characteristic of the Berkshires, viz., solid black, with white feet, white tip of tail, a little white on or about the face and jowl, and occasionally a splash of white elsewhere. Their ears are medium or small in size, but still drooping, and are pliable and silky.

GOAT GOSSIP.

B. A. R. Stocker, San Luis Obispo.

There is a goat in our town that can stand on his hind legs and look down on you over the top of a seven-foot fence. He is not a native son. He was born in Switzerland. He is a Saanen. Does of his kind being entirely too scarce in California, they have crossed him on Angoras. Now, an Angora does not claim to be a dairy goat. It is a different proposition. She can raise her own kid, and then she is through, but her milk is very rich. Well, the doe kids from these first crosses give in their first lactation—hold your breath—three, four and five quarts a day. If you can buy Angoras for two and a half or three dollars, those kids would be worth more than ten times as much. And they may double their yield when mature.

The big Saanen is being used here for the best milch does we have of any breed, including Joggenburg and Alpine. We know of a Toggenburg-Saanen doe which was fresh at eleven months, and now eight months later is still giving two and a half quarts of milk. She is a beautiful breedy looking creature. For results there is nothing like a dash of the real thing. There is an old Alpine goat at Paso Robles with a record of eight quarts a day. This milk is worth two dollars; and two dollars would probably keep her three months.

Hats off to the dairy goat!

At our County Fair just now the enlightened management has offered prizes for milch goats—a new departure, for even the State Fair has not yet recognized them.

Secretary James Wilson, of the United States Department of Agriculture declares sugar-beet pulp is the best butter producer in the world. 40c per ton at LOS ALAMITOS SUGAR FACTORY.

In considering the efficiency of brood sows, Henry Wallace gives the following advice: "Go over those that have had pigs the present year and ask them the following questions: How many pigs did you have this year? Were they even in size and form? Were they all good ones, or did you have two or three choice pigs and were the rest quite inferior? How did you take care of these pigs? Are you a good suckler? Are you good natured? Are you a good mother, or are you one of the nervous, fidgety kind, always worrying and fretting for fear somebody will hurt you and your precious piglets? If the brood sow on being interrogated, cannot give satisfactory answers to these questions it is not worth while to scold her or give her a moral lecture. Just turn her into the fattening pen; for there is where she belongs."—From Coburn's Swine

---

Jersey breeders of Oregon took advantage of their presence at the recent state fair to organize themselves into the "Oregon Jersey Cattle Club."

SPRAYING, WHEN, WHY AND HOW, Cover, 411, 417.

LIVE STOCK AND DAIRY.—Making the Dairy Pay; Popular Poland-Chinas; Goat Gossip: 418, 419.

EDITORIAL.—Spraying; Farm Help Problem; Frost Protection; Buy Early; Florida's Output; Insecticide Act: 420.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern Central, Southern, The Coast: 421.

PRACTICAL POULTRY CULTURE.—Standard of Rocks and Reds; Profitable Age of Fowls; Facts About Breeds; Poultry Pointers; Ailing Black Minorcas; Caught on the Wing: 422, 423.

QUERIES AND REPLIES.—Soil for Lawn; Eucalyptus Trees; Alfalfa Rust; Killing Bermuda; Oil Driveway; Picking Live Fowls; Blight Resistant Walnuts; Fungus on Walnuts; Seed Bed Oranges; Tomato Worms; Curing Tobacco; Franquettes; Grain With Alfalfa; Eucalyptus from Seed; Bloat: 424, 425, 426.

HOUSEHOLD.—Valuable Meat Substitutes: 428, 429.

PRODUCE MARKET.—Los Angeles Market, San Francisco Market; Deciduous Market, Citrus Market: 430, 431.

The Southwestern Poland China Record Association and the American Poland China Record have been consolidated and will operate in the future under the name of the American Poland China Record. This will doubtless greatly simplify the registering of this popular breed. It is said that Poland China breeders outnumber those of any other variety of swine and this concentration of energy in one association will be a benefit to the fraternity.

Spraying

Of all the agricultural implements we presume the spray pump is looked at with the least pleasure. There may be a genuine delight in following the plow and watching the rich soil turning, ready for the planting of seed; likewise with cultivation. But the insect and fungous troubles which come afterward appear as interlopers only and present a problem in farming economy which is nettling rather than inspiring. Some farmers have said that they would wait until the natural enemy of the pest appeared and let nature balance her own account, and there have been instances where they have won out, but unfortunately these are not many.

Some pests cannot be handled within economic bounds by spraying but there are few first class fruits produced that have not had the spray pump called to their aid. A glance at our leading article this week will show that these pests are almost innumerable. Luckily, no farmers have to deal with all of them, but in some section of this state some of the vast number we have chronicled must be conquered or controlled. The wise farmer, and especially the fruitgrower, is prepared to meet these pests when they appear—in the case of the fungous troubls, before they appear.

We believe this issue of the Cultivator will be invaluable to the forehanded farmer if it is laid away where easy access may be had to it. Most of the formulas are quickly prepared once the directions are secured.

This calendar has been prepared with considerable labor, and we take this occasion to express our appreciation to Mr. E. O. Essig of Santa Paula who has aided very materially in correcting and in furnishing much of the material. Mr. Essig is one of the younger of the horticultural commissioners of this state, and his conscientious and painstaking work will win for him recognition in a larger way than he has yet secured.

Farm Help Problem

The question of farm labor has been one of the most perplexing confronting California farmers, and not only farmers in this state but in all sections of the East. In California the "blanket man" represents the usual farm laborer. That there are many farm laborers of the higher grade goes without saying, but the rank and file have, as a rule, proven unsatisfactory. For this reason, many employers have turned to Oriental labor and claim that this class is more satisfactory than the American laborer of the ordinary traveling class.

Unsatisfactory results of efforts to use American labor may be charged to the laborer, but is it not worth while to discuss for a moment whether or not the employer may not be himself in a measure at fault? The bunkhouse method of housing labor has been condemned many times, and the self-respecting laboring man has been many times humiliated by his treatment by his employer. While admitting that the taking into the home of such people as ordinarily carry their blankets from ranch to ranch is out of the question, at the same time is there not some way to provide the self-respecting laborer with decent and homelike surroundings?

On this point, Mr. Geo. D. Kellogg, in a letter of regret that he could not be present at the Farmers Week program at Davis, said: "Every ranch should have comfortable quarters for the help. I have followed the plan of employing white help and they have been given comfortable quarters and become identified with the neighborhood, supporting its churches, schools and society. This worked well and gave me most efficient help until these helpers obtained ranches for themselves and became permanent citizens."

Perhaps the employer of Japanese labor can say that his help sometimes become permanent citizens of the community, but unfortunately not to the upbuilding of the community, for where a Japanese remains and takes up his own garden operations the social life of the community, from an American standpoint, has not been elevated.

The Pomona plan has been spoken of by the Cultivator before and has been followed there for years. It is the result of circumstances rather than a definite plan. It is simply this, that the industries are so diverse that the small home maker finds employment for members of his family in nearly all seasons of the year. The section is more largely a citrus producing one, but there is a sufficient quantity of deciduous fruit produced so that a large cannery gives employment for many people the summer through. In addition, many driers work up both apricots and peaches. These activities fill the summer, while orange packing, olive pickling and other lines give abundant labor during the remainder of the year. We presume there are fewer oriental laborers in Pomona than in any other producing section of equal magnitude. As a consequence it proves one of the most attractive home places in California.

A little concert of action following thorough investigation of possibilities should bring a similar condition in other localities.

Frost Protection

The wise orange and lemon grower is placing his orders for frost protectors, fuel, and appliances for handling it. In fact, many orchardists have already stoves distributed and filled, ready for the unwelcome visitor. We have seen in the orange sections many years ago weather which caused bursting of water pipes on the 2nd, 3rd and 4th of Noveml Such weather at that season is exceptional. However, in all our citrus growing districts that kind of weather is "exceptional" at any time of the year. It is just that condition which the grower must prepare for if he expects the greatest success.

On this point we wish to refer to a remark made by Mr. G. E. Rowe of Grand Rapids, Michigan, who was one of the judges at the Watsonville Apple Annual. Mr. Rowe said that he had noticed that apple or peach orchards which were plowed a month before blossoming time, then put in best of tilth, were almost invariably exempt from injury by frost. He noticed it especially last spring at the time of the most severe freeze the fruit districts of the East have suffered in years. He spoke of one orchard in particular adjoining one not plowed until after the frost had passed, the latter having no fruit whatever, while the plowed orchard bore an immense crop. All other treatment of the two orchards was almost identical. We do not know that these conditions would obtain in an orange grove, and where green manuring is practiced this treatment would be impossible, but for those who do not practice green manuring it might at least offer an interesting experiment. Mr. Rowe's idea is that with the deciduous fruits, cutting of the roots prior to blooming long enough for a callus to form over the broken ends and for new roots to start, puts the tree in better condition for resisting injury. In fact, it is well known by all orchardists that if a tree is in good thrifty condition, the fruit on it is less liable to injury than on one which has been indifferently cared for.

But above and beyond that preparedness with fuel to directly combat the cold is wise.

Buy Early

We hope the present issue of the Cultivator with its invaluable spray calendar will be filed. It will answer many a question in the future and prove of double value if where it can be turned to quickly. Another issue in the near future will likewise be one of exceptional value. For some weeks we have been in correspondence with nurserymen and have asked them to answer a series of questions as to planting and early care of nursery trees. We have these answers in hand and they will be used soon.

The planting season is approaching and it is none too early to have matter of this kind in our columns. Likewise it is time for the orchardist who proposes to plant to engage his trees. There are but few nurserymen who cannot at this time supply any tree which may be desired, but the planter who waits until midseason or well towards its end and then rushes to the nursery for his stock may be compelled to take "something just as good."

If our readers will note the columns of the Cultivator these days it will be seen that a large amount of excellent reading is being furnished at $1.00 per year.

Florida's Output

W. C. Temple, President of the Florida Citrus Fruit Exchange places an estimate of 4,000,000 boxes on Florida's output of citrus fruits for the coming season. He divides it as follows: "Ordinary commercial run of oranges, 2,000,000 boxes"; "Valencias, Tardiffs, Tangerines, Pineapples, Kumquats, Lemons and other fancy and various fruits, 750,000 boxes;" "Grapefruit, 1,250,000,000 boxes." This estimate we take it was made before the recent hurricane which caused immense damage in some sections. So far as we can learn this was not so great in the orange growing districts as in some others. One estimate has it that the loss will be between ten and twenty per cent of the citrus fruits.

Reports from market centers go to show that the first Florida fruit received is altogether too green. Prices at Cincinnati range from $2.00 to $2.75. Grape fruit is meeting better reception and commands for 80's, $2.50 and for 64's, $3.25 to 13.50.

Insecticide Act

The committee formed in December, 1907, at the Chicago meeting of the Association of Economic Entomologists was called a standing committee on insecticides. This committee believed that through the Pure Food and Drug Act or a special act, chemicals used for insecticides and fungicides should be guaranteed through analysis as to their purity of content. The work begun at that time was carried to completion or rather well on the road to completion in an act called the Insecticide Act of 1910, passed by the last national legislature. This measure goes into effect on the first day of January, 1911, and will regulate the standard of insecticides and fungicides in so far as interstate commerce is concerned. Some states have legislation of their own covering this point, but this national enactment will give additional protection even in these states. It is probable that further state legislation will not be needed for the national law should be sufficient.

The Cultivator acknowledges the receipt of a copy of the second and revised edition of Prof. Wickson's "California Vegetables in Garden and Field," a volume of some 350 pages, which ably discusses the best thought and practice in California vegetable growing—an industry which has gained much in commercial importance during the past few years. In scope and cultural directions the work is peculiarly well adapted to meet California conditions of soil and climate, thus rendering it indispensable to all producers of garden crops, whether commercially or only for family use. Price $2.00. Copies are to be had at the office of The California Cultivator.

The Department of Agriculture is taking cognizance of the demand for school work along agricultural lines and is issuing Bulletin 408, "School Exercises in Plant Production," by Dick J. Crosby. These various exercises bring to the pupils information as to the absorption of moisture by plants from the soil, how they get food from the soil, how they give off moisture from the leaves, how the water rises in the plants, and so on, with a series of over 46 exercises. The bulletin has 48 pages, fully illustrated, and may be had for the asking.

Agricultural News Notes of the Pacific Coast

Northern California

Bend, Tehama county, is curing a very high grade of tobacco.

Sutter and Yuba counties have finished their grape shipments.

Grass Valley is now harvesting its third strawberry crop of the season.

A fruit dryer at Scotts Valley, Lake county, was recently destroyed by fire.

The cheese factory at Bieber, Lassen county, has a daily output of 300 pounds.

State Forester Homans will soon issue another booklet on eucalyptus culture.

Pittville, Shasta county, has tided over the long drouth with a number of artesian wells.

Bean growers in Sacramento, Solano and San Joaquin counties have finished harvesting.

Glenn and Colusa counties are maintaining an exhibit of their products in San Francisco.

Farmers' Union at Live Oak, Sutter county, has 2,000 tons of wheat and barley warehoused.

A new reclamation district has been formed in Colusa county to contain 252 acres of rich land.

The wool growers of Red Bluff sold their clip at the recent sale at prices ranging from 10⅝ to 12 cents.

Paradise, Butte county, is advertising its possibilities as an apple section by holding its annual apple show.

Apple orchards at Mountain House east of Oroville, Butte county, were seriously injured by windstorms last week.

One stock breeder at McArthur, Shasta county, recently sold 500 head of three-year-old steers at nine cents a pound.

The highest price paid at the Cloverdale sale of wool last week was 13¾ cents. Last fall's highest was 16 cents.

A serious forest fire which caused some damage, though finally brought under control, occurred at Stirling City, Butte county.

The government has a force of 50 workmen at work on the Yuba river east of Marysville clearing the brush from the river bed.

The withdrawal of butter from cold storage in the San Francisco warehouses is now the heaviest of any time during the season.

The Butte County Water Users' Protective Association recently elected C. W. Fresher president, and P. J. Baltimore secretary.

The output of peaches from Red Bluff, Tehama county, was more than double that of last year. The greatest number of any variety was of Muirs.

Present indications point to the coming exhibition of the Pacific Coast Horticultural Society at San Francisco, being the most successful ever held by the society.

Farmers at Winters, Yolo county, have an organization in the Mutual Telephone Company which has proved very satisfactory as an association and will now be incorporated.

Central California

Santa Clara Valley reports keen demand for small ranch properties.

The farmers' institute at Dos Palos on the 24th was one of great interest.

Tulare county is now making up full trains of oranges for the Eastern markets.

The Co-operative creamery at Visalia is producing about 15,000 pounds of butter daily.

It is rumored that a Los Angeles capitalist will plant 18,000 acres to oranges near Porterville.

The raisin crop of this year is conservatively estimated at about 25 per cent short of last year.

The Independent packing house at Porterville is receiving material additions and new appliances.

Farmers at Kerman are planning a co-operative telephone company for that section and adjoining colonies.

It is estimated that one-half of the raisin crop will be moved between the present date and the first day of January.

A case of reported glanders near Porterville, Tulare county, has proved after the mallein test to be some other disease.

The cannery at Stockton is now running full time on tomatoes, employing 300 hands at prices ranging from $1.50 to $3.00 per day.

The Farmers' Union of San Jose recently held an important meeting at which an address was made by County Entomologist Morris.

The Dinuba Farmers' Union has been sued by the Consolidated Seeded Raisin Company to prevent use of the Anderson Seeder.

Celery growers on the delta lands west of Stockton are marketing the biggest crop ever for that section. The output will exceed 300 cars.

The Consolidated Raisin Seeding Comany is entering suits against many different raisin companies to prevent claimed infringement on patents.

Tomato crop in Monterey county is abundant this season, selling at 1 cent per pound. There is also an oversupply of hay, but the price is fairly good.

An effort is being made to commence a large distillery at Stockton for the manufacture of denatured alcohol. An expenditure of $100,000 is contemplated.

Contention has been created in the Porterville section by the employment of Hindu labor. Many have insisted that Porterville should be "for white labor only."

The Fresno Republican says that "Evidences of a distinct bear movement framed up to scare off trade from buying raisins now and conducted by several of the 'leading packing firms of the Coast' are coming to light."

Livingston, Merced county, is now engaged in harvesting an immense sweet potato crop. Atwater was formerly the principal shipping point, but Livingston maintains that another year will see her the center of the big industry.

Southern California

Orange county has 167,240 bearing apricot trees.

The Chino Land & Water Co. is fattening 3000 head of cattle on beet pulp.

California has about 5,000 acres of celery, of which 2600 are in Orange county.

San Fernando Valley is now producing some exceptionally fine alligator pears.

Improvements are being made on the Newbert Protection District in Orange county.

The national president of the Farmers Union is to visit the Coachella Valley unions.

A suit involving the validity of bonds isued by the Perris Irrigation District has been filed.

Covina, Los Angeles county, maintains that it is able to produce 2,000,000 boxes of oranges.

Ventura County Lima Bean Growers' Association recently shipped 15,000 bags of beans by water.

With lemons at $13.00 per box, as they were for two or three days recently, the lemon orchardists smile.

Seven hundred acres of land near Brawley, Imperial county, will be planted to garden peas to be raised for seed.

Hesperia, San Bernardino county, has been considered as simply an adjunct to the Mojave desert, but is now producing some exceptionally fine apples.

Chino, San Bernardino county, is producing more oats than heretofore, having used already this season two cars of seed.

Independent shippers have been provided a place for the auctioning of oranges in the market place by the New York Central.

Irrigators of Imperial Valley are still discussing the matter of water rates with the receiver who insists that the former rate is insufficient.

The investigations in evaporation conducted by the Weather Bureau for some months on the edge of the Salton Sea have been discontinued.

The Arlington Co-operative Creamery has been incorporated for the purpose of conducting the creamery at that place. The capital stock is $20,000.

The Lakeview Wool Storage Company has commenced the erection of a wool warehouse at Lakeview with a capacity for 1,000,000 pounds, so arranged that every sack of wool stored can be inspected by the intending purchaser.

The walls are rising for the brick building which is to house the new Delta creamery at Imperial, says the Daily El Centro Press. The building is of brick, 24x40 feet, and on three sides will have a twelve-foot arcade to protect the structure from the sun.

N. B. Smith of Ventura, claims in the Free Press, that from 19,200 square feet of ground he harvested this year, 1938 pounds of Irish potatoes, 1240 pounds of sweet potatoes, 300 pounds of lima beans, 100 pounds of small beans, 50 pounds pink and blackeye beans.

The Coast

Colman, Washington, is shipping fifty cars of apples.

Portland prices on hops are running between 10 and 12 cents.

Spokane reports thirteen cent hop sales, with an evident upward trend.

A three-day fair at Chesaw, Wash., closed last week with large attendance.

Cheaper freight rates on wheat is the cry of farmers at Walla Walla, Washington.

Yakima, Washington, shipped over 1,200 cars of apples during the month of October.

The Territorial Fair of Arizona is to be held in Phoenix the week of November 7th.

One thousand men are employed in building an irrigating canal in southwestern Idaho.

School gardens are an adjunct of practically every school in the Hawaiian Islands.

Many potatoes were seriously injured by frost near Tacoma during the last of October.

Walla Walla, Washington, has shipped during the past season 1,312,000 bushels of grain.

The Mababai ranch of 400,000 acres in Mexico, near Douglas has been sold to a British syndicate.

A drainage canal nearly 19 miles long will reclaim a quantity of land at Chewelah, Washington.

Columbia county, Washington, shipped 50,000 sacks of potatoes at $1.35 per sack within one week.

The C. M. Co. is now growing some 2,000 acres of sugar beets over the line from the Imperial Valley.

The Wenatchee Commercial Club is packing its exhibition fruit for the National Apple Show in Spokane.

Grape growers of the Columbia and Yakima Valleys met at Kennewick, Washington, in annual convention.

Sheepmen at Boise, Idaho, have been fined for violation of federal laws as to pasturing in forest reserves.

Thousands of acres in the Arizona forests have been restored to entry by a recent ruling of the Department of Agriculture.

The Secretary of the Interior has withdrawn 3840 acres of land in Western Utah as a site for the Strawberry Valley reservoir.

There is a project to build an immense dam 700 feet high to store the waters of the Colorado River in the Grand Canyon and develop a million and a half horsepower.

That the public may know something about the agricultural resources of Colorado and New Mexico is the raison d'etre of an attractive publication, "The Fertile Lands of Colorado and Northern New Mexico," just issued by the Passenger Department of the Denver & Rio Grande Railroad. The Agricultural advancement in that section of the United States is so marked from year to year that it has been necessary to publish eleven editions of this pamphlet in order to keep pace with the steady development of the various districts.

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

The worst thing we have to contend with in getting new customers to try

West Coast Egg Food

is the "stuffs" that have been put on the market called "egg foods," largely composed of unsound grains, mill refuse, and cheap, very cheap, Japanese rice bran and such offal. When we once get a trial of "West Coast" we have no further trouble. No such stuffs in ours. We are winning out in great shape by making first-class feeds at prices as low as those "cheap" ones. Try "West Coast" just once. 75-lb. sack only $1.80, or $45.00 per ton. If not sold by your dealer, send to us. Or, if you are distant from Los Angeles and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

West Coast Mill

Office and Salesrooms, 115 Winston St.
Los Angeles, California

PROTEINA WILL DOUBLE **EGG-PRODUCTION**

A prominent Poultry raiser writes us that in one week's time Proteina increased the egg-yield over 50% during the month of October.

Practical Poultry Culture

STANDARD OF ROCKS AND REDS.

Please give standard requirements as to Buff Plymouth Rocks and Rhode Island Reds.—Subscriber, Tulare.

We quote from Perfected Poultry as follows:

Buff Plymouth Rocks.—The Plymouth Rock male must have an evenly poised body, centering from the thighs and shanks. The demands of shape are for a long, broad, moderately deep, well-developed, well-rounded formation, with a medium long keel, well-developed abdomen, the back to be covered closely with feathers, which build up a rising incline or concave sweep to the tail, with a moderate fluff development about the abdomen. In color the Buffs should have a true, even shade of golden buff throughout their entire plumage, this to be free from shading, shafting, or other imperfections. Every feather in the body, including the wings and tail, should have this true, even, buff color. If any shading at all of color is permissible, it should be confined to the flights and the main tail feathers. The less of this, the better, for the desirable color of plumage is one even shade of golden buff throughout. Beaks and shanks, rich, attractive yellow; eyes, bright red; comb, wattles and ear-lobes of all Plymouth Rocks bright, attractive red; comb formation even, smooth, of fine texture, evenly placed upon the head, the high point in the center, grading gradually away from the center, front and rear, forming a handsome, evenly serrated single comb, which does not exceed five evenly placed serrations, dividing off a well-constructed point or section of the comb. The top color of the male Buff Plymouth Rock is always richer and more brilliant than the under-body color, or the surface plumage. Under-color to the skin, including the entire shaft of feather, buff, or a shade that does not show shafting in the feather.

Rhode Island Reds.—The Single-combed and the Rose-combed Rhode Island Reds may both be described as having a broad, deep body, of medium length. The length of the body indicates fine egg-production. They are rather low built, heavy set, having equal poise of body front and back of shanks. The color of shanks and toes is yellow or reddish yellow; beak, the same; comb, face, wattles and ear-lobes, including the eyes, red; main tail feathers, including the sickles, black, having a greenish sheen; coverts, mainly black, powdered with red; surface plumage in males, top color, rich brilliant red, breast and under-body color, not so brilliant as top-colored plumage. In the color of the male or female no color should appear but the rich red with the black shadings; no white permissible. The plumage color of the female is of a lighter shade of red and more even throughout than the color of the male; the under-color of both male and female is red or salmon; the tips of the lower hackle feathers of the female should have a black ticking, not striped or laced; the wing primaries in the male and female, black; upper web, red; secondaries, lower web, red; upper web, black. In the male, wing-bow and coverts, red. The main tail feathers of the female, black or greenish black.

PROFITABLE AGE OF FOWLS.

The question as to which is the most profitable breed of fowls is very frequently asked. There are undoubtedly differences in breeds, but undue importance should not be placed upon breed. The trap nest has shown that there is more difference in individuals than in breeds. We must get away from that idea in poultry keeping. If a man starts in the poultry business with the "best breed," as he believes, and has with it the notion that breed is everything, he will meet with inevitable failure. The breed may be all right, but the fowls must be encouraged to do their best by good care and management.

When eggs are firm at 40 cents per dozen and the hens fail to respond, the owner is likely to become unreasonable and take up with another breed. And most likely the fault was not in the breed. The fault is usually one of two things: Either the hens are of a poor non-producing strain of the breed, or the management is poor.

It is a point in management that I wish to speak of here, one point of many that must be taken into account if poultry keeping is to be made a success. It is a question of the most profitable age of the hen. Poultrymen who have kept in touch with poultry investigations during the past few years are pretty well informed on this point, but the importance of this subject is not yet generally appreciated. The writer carried on for several years at the Utah Experiment Station a line of experiments with the object of determining the value of the hen at different ages for egg production. The same hens were kept year after year under similar conditions and a record was kept of production.—James Dryden in Coleman's.

FACTS ABOUT BREEDS AND BREEDING.

There is no foundation for the theory or belief that certain varieties of fowls are more hardy than others. It is true, however, that not all the foreign varieties take kindly to our climate; but if the breeding is right, we can build up a rugged race out of almost any known breed. Breeds are often condemned for lack of hardiness when the fault really lies at the door of the breeder who has used injudicious methods.

Properly to select and breed the stock is an important secret, and in this particular the writer can present information that will be useful to poultrymen.

In originally buying the stock it is important that it be obtained from a reliable party, out of a well-established "strain" of its class, noted for hardiness and good, strong utility qualities.

You must satisfy yourselves that the specimens purchased are not related, as, for instance, brothers and sisters. There is not so much danger if the chicks chosen are from eggs laid by different hens of the same variety, though bred to the same cock, but the chicks must be of a thrifty nature.

The more remote the actual relationship is, the better, as the offspring from birds bred too closely, in this respect, hardly ever prove so satisfactory as those secured from stock of both sexes that are not nearly allied in kin.—Poultry Secrets.

POULTRY POINTERS.

Kerosene the roosts.

Have regular feeding hours to feed.

Dampness is to be prevented at all times.

A liberal use of whitewash is beneficial.

One bad egg is a thorn in your reputation.

It is what you feed that counts in results.

As the weather gets warm lesse the feed of corn.

Millet is a good feed to put in the scratching litter.

When the chicks' wings begin to droop look for lice.

Rats are a bad thing when they take quarters in the poultry house.

In breeding be careful not to dro utility points to get standard.

A little linseed meal in the soft feed once in a while is very beneficial.

The character of the food ha much to do with the quality of th eggs.

Always have plenty of grit befor your fowls. Remember it is the teeth.

High feeding and lack of exercis are the cause of a good many infertil eggs in the spring.—Green's Fru Grower.

Poultrymen, Attention

We want to tell you what we are doing. We are erecting at the present time Yards and Pens for the largest and most up-to-date plant for fancy poultry in Southern California. We can carry on hand with our new yard about 3000 birds. We sell every standard variety, of Pullet, Cockerel, Laying Hens and Cock. We have them on hand EVERY DAY OF EVERY WEEK OF EVERY YEAR. We have been in the Hatching business for 12 years in the west. The Pioneer Hatchery has been established for several years, and from a small start is now the largest baby CHICK DEALERS IN THE ENTIRE WORLD. No order of any kind in the Poultry Line is too large for us. If you want to sell 100 or 1000 hens or more we will be glad to bid on them for spot cash.

We are shipping at present about 7500 baby chicks per week, of the Reds, Minorcas, Leghorns (White and Brown), Barred Rocks, Buff Orps., etc. Whatever you need in our line we will be glad to make a price on. If we can't sell you better poultry for less money, don't buy from us. INVESTIGATION is all WE ASK.

The Pioneer Hatchery Co., 108, 112, 114, 116 East Eighth
Los Angeles, California

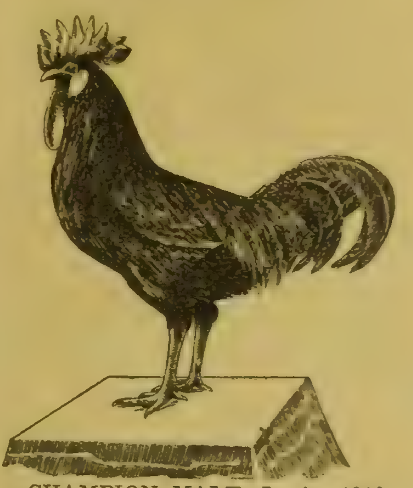
GUARANTEED

AILING BLACK MINORCAS.

We bought two dozen Black Minorcas and have had them now three weeks. They look sickly; one has died. They seem to have been almost starved, but where placed there was all kinds of food on the ground, since oat threshing and also since corn was threshed. They also were covered with lice and ticks—a flat almost blue black bug that sticks its head in the flesh. A lady advised us to use Conkey's Lice Paint, and to feed them Dr. Robert's Poultry Tonic in a mash of bran and onions.—Subscriber.

See issue of August 11 which has a full discussion of the tick question. Also cover all of inside of houses with distillate or coal oil to wipe out the mites.



CHAMPION MALE, L. A., 1910.
Lovell's Black Minorcas.

CAUGHT ON THE WING.

Once a week, at this time of the year a little Epsom Salts should be added to the water, and twice a week a small piece of sulphate of iron, the size of a small bean, to every pint and a half of water. This will help to keep the birds in a healthy, active condition.

By placing eggs in cold water for twelve hours they become unfertile. This hint is no doubt useful to persons who have a special breed, and not sufficient orders for eggs and settings.

Whatever the kind of food, it is imperative that meals be given at regular times. When a meal is missed on no account give double the usual amount of food at the next feeding time.

The exhibition stock should now be weeded out, disposing of those which are faulty, and pay all attention to those which bid fair to do some winning.

Maine has the credit of raising the first "crowless" roosters. Alton, Ill., now comes to the front with "wingless" fowls. It remains for some one now to produce a hen without a cackle and scratch machine, and the three bred together will produce a ne plus ultra to please even the worst hen haters.

A little sprinkle of grit is sufficient for chicks at first. If given the chance they will fill up with it and die.

Ducklings should have fresh water often, as their feeding and drinking at one time mix feed and water and make water foul. Waterfowl naturally love to liquidate their bills, whether you do or not.

State inspectors condemned 13,000 pounds of cold storage poultry found in a Seattle refrigerating plant. It was sent to a "fertilizer" factory.

It is wise to remember when those turkeys hatch that they are semi-wild. Every year some farmers report failure. They do not change their stock nor methods. They kill them every year with the same old dope—sloppy cornmeal and red pepper. It's like a man tearing his pants on the same nail every time he enters the barn.

When a man sets out to beat a hen at her own game, he is pretty apt to come out of the struggle a little bit doubtful as to the result. A woman can do such things firstrate. She doesn't go at it with a club, but with a bit of corn in her apron.

Go In and Make Money

Poultry offers the surest, easiest way of anything that's open to you. Don't waste *all* your time considering. Go in and *make* it win.

I have started over 61,000 people the Queen Incubator Way. May I do the same for you? Get my offer on

The 1911
Queen
Incubator

The Incubator that makes money for poultry raisers. Take one and try it for [illegible] or more days and prove for yourself that it is the hatcher I claim it to be. I take all the chances. *I pay the freight,* too, and give a [illegible] year guarantee now. It is my way of showing people what they can accomplish with Queens.

Get the 1911 Queen Book

The New Queen Poultry Guide and Catalog is larger and finer this year than ever. It tells how to make money with poultry and how to get a Queen Incubator on the most generous terms ever offered. Let me send you my great book to tell you about Queens and Success. An infallible guide—no other book like it. *Free and postpaid.* Address

Wickstrum, The Queen Incubator Man
Box 53, Lincoln, Neb.

EGG MAKER

I Have Ten Hens and Get Ten Eggs Each Day

by feeding "Lee's Egg Maker." Without waiting another day, go out and count your hens—count them carefully. For a week keep an accurate daily record of the eggs you get. The guarantee below means *you.*

WE GUARANTEE

that no matter what you are feeding, and regardless of the number of eggs you are getting at the present time, if **Lee's Egg Maker is added** to the daily ration—made a portion of it—the increased egg yield resulting therefrom will more than pay the cost of the Egg Maker, cost of labor required, and **100 per cent profit** on said labor.

We don't care what your hens are doing *now,* we ask you to buy Lee's Egg Maker on our *guaranty* of an *increased* egg-production at a *reduced* feeding cost. Could we make you a better proposition?

The amount of good *digestible* protein is what counts for results in poultry feeding, and America's big feeders say Lee's Egg Maker contains more *digestible* protein than any other poultry food they can buy.

Lee's Egg Maker is almost entirely a meat food and with an actual tested protein feeding value in *excess* of *80* per cent, and you'll find in it the essentials entirely lacking in other prepared poultry food. The best feeding authorities in the country endorse it—and *use it.* *You* can't afford *not* to feed it, whether you have 10 hens or 1000, the proportionate profit would be the same.

Price: 2½ lb. pkg., 25 cts., 25 lb. pail, $2.50. Ask your dealer or send direct to us. We pay freight in 100 lb. lots.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

Malthoid Roofing

You cannot get a good weather and
waterproof roof for your building
from a poor roofing.

The roof of your building is the
most important part of it and
unless your roofing is right, there will
be no peace of mind for
those who live under it.

A roof that leaks causes no end of
trouble, besides a lot of damage.

The best way to protect yourself from
these unnecessary troubles, is to
use Malthoid Roofing.

Malthoid Roofing is made in the
largest and best equipped
roofing factory in the world.
The men who make it have been
making roofings for
twenty six years and they understand
what is necessary to make a roofing
which will give perfect satisfaction,
no matter how it is used,
where it is used or
under what conditions.

The makers of Malthoid Roofing
guarantee it to be a perfect roofing—
to give perfect satisfaction and to
last as long as the building it covers,
provided it is properly laid and
ordinary care is taken of it.

Twenty six years of experience enables
the makers to guarantee
Malthoid Roofing
under these conditions.

To be absolutely sure that you have no
roofing troubles, buy
Malthoid and lay it properly.

It's free

Send for it. A new and valuable book on the **"Care of Roofing."**

No matter what your experience has been or what roofing you have used, this book will enable you to take better care of it. Sent free.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Soil for Lawn.

I wish to plant lawn this fall or winter. The land was formerly hog wallow, deep red clay which bakes exceedingly hard after watering. Of course with the lawn seed planted it is impossible to work it. Would layer of loose soil over the top be advisable, also fertilizer, or is sand preferable?—Subscriber, Visalia.

Hog wallow land is liable to be underlaid with hardpan, and we would advise investigation as to this point. If there is hardpan present, it should be broken up so as to allow drainage. This could be done by deep sub-soil plow or by using sticks of dynamite. As to surface, would advise placing of a few inches of rich loam soil over the top. Then after the soil is settled or worked so that any unevenness may be determined and leveled before seed is put on, the surface should be fined and seed applied on the good top soil. The very lightest raking in is advisable. Some prefer to drag brush lightly over the surface rather than to use rake. Still further advantage may be gained by applying over this seed a very light coating of fine dry mulch from corrals. This must not exceed one-half inch and less is better. This prevents drying of the surface and permits the seed to come through. In the warm weather the surface should be sprinkled twice daily.

Eucalyptus Trees.

Can you inform me as to care of eucalyptus trees, when to trim them, and cultivation necessary?—Subscriber, Santa Rosa.

The care of eucalyptus trees depends so much upon circumstances, soil, available irrigation, etc., that to answer such a question without further particulars would require much space. We have seen eucalyptus trees planted on rocky hillsides, set very deep, that did well without further care. Again, we have seen them killed out on richer lowlands where a little irrigation that first year would have kept them alive and they would ultimately have made strong growth. If they are planted on level land where they may be irrigated and cultivated the first two or three years but little care will be needed. As to pruning, if grown for timber purposes, if planted close together, say 8x8 feet, the side limbs will be automatically pruned off and they will grow straight, trim trunks which will make good poles and after they are thinned out for poles the rest will make good timber trees. If planted in yard or where shade is desired top the first year's growth, also the second, to make them branch out and produce stockier trunks.

Alfalfa Rust.

I mail specimen of alfalfa which seems to be affected with some kind of rust. It is worse in spots but not yet serious. Am also sending sample of alfalfa seed. Can you advise me as to its quality?

The alfalfa leaves were affected with the common alfalfa rust (Uromyces appendiculatus Lev.), for which there has been no treatment attempted which is in the bounds of economic possibility. This rust has never been serious and we do not think our inquirer will have trouble with it.

The seed sent is exceptionally good, showing no dodder and is very plump, and so far as can be judged by looking at it, fertile.

Killing Bermuda.

When should I dig Bermuda grass lawn to re-sow to blue grass?—Subscriber, South Pasadena.

The digging up of Bermuda grass lawn and the re-sowing to blue grass presents many difficulties unless a year or two of clean culture is given. We have seen soil in which Bermuda is grown screened through fine wire screen to remove every particle of root and then the next summer a great quantity of Bermuda grass came up again. If seed is sown at once and continuous work done next summer, the Bermuda might be kept down. The difficulty, however, would be very great. Bermuda's growth is slowest in winter, hence the fall is the best time to sow blue grass seed.

Oil Driveway.

What is the best time to make oil driveway? Is it wise to make it during the winter?—Subscriber, South Pasadena.

We do not think that there is any preference in the season of making oil driveway, except that in summer evaporation is greater. The ground is warm and will take in the oil more rapidly. In any case apply oil very hot and good results will follow.

Picking Live Fowls.

Is it against the law to pick live fowls in California?—Subscriber, Orange.

We are unable to say as to any definite law in this respect, but if needless pain is given to any animal of course the S. P. C. A. would take it up and be able to prevent it.

Blight Resistant Walnuts.

Where may I secure blight resistant walnuts suited to elevation of 1000 feet, level land, deep gravel loam, well drained on western slope of Coast Range —G. H., San Luis Obispo.

Our inquirer is seeking for that which has not yet been found. Many others are inquiring for a blight resistant walnut tree. Some most excellent trees have been found which are to a degree blight resistant, but never one which is completely so. The Eureka, Chase, Neff and others are now growing in various Southern California orchards which are said to be blight resistant. Farther north, the Franquette, Mayette, Concord and some others have been declared desirable. What variety would do best under your conditions it is impossible to say, for that is a question best answered by orchards in your vicinity, if there are any. If not, only actual experience can determine it. In that case, grafted nuts will give quickest results.

Fungus on Walnuts.

Kindly note disease on walnut leaves of Ford's Improved Soft Shell. —Subscriber, Colima, Mex.

These leaves were examined by Prof. Clayton O. Smith, assistant plant pathologist at the Southern California Pathological Laboratory at Whittier. He writes:

"There seem to be several different sorts of spots on the leaves. In fact, at this time of the year when the leaves are old they are a very suitable place for different kinds of spots to develop. In no case is there sufficient development of the disease to show the real trouble, and I could only suggest what might cause the larger brown spots. They might be caused by Marsonia juglandis, which is a rather common fungus on the black walnut and butternut of the eastern states. These troubles are not as a general thing severe enough to require any treatment. The leaf with the many small black spots looks very much like the California walnut blight."

Seed Bed Oranges.

What is the best way to care for seed bed orange trees? How often should they be irrigated and how long does it take them to come up? Are they better in or out of lath house?—Subscriber.

Had our inquirer observed the requested courtesy of signing his communication we would have sent him issue of Cultivator containing particulars he asks. He may find these directions in Cultivator of March 17, 1910.

Tomato Worms.

My tomato vines are being eaten by large caterpillars three inches long, green in color. Worms eat the leaves and fruit. What is preventive or remedy?—Subscriber, McFarland.

The best remedy for these "caterpillars" or worms is hand gathering. It is easily and quickly done and is practically the only safe remedy. Of course arsenical poisoning is possible, but where ripening fruit is on the vines, it is not wise.

Curing Tobacco.

How can I cure home grown tobacco so as to make it mild?—Subscriber, Santa Rosa.

Mild tobacco is not so much a question of curing as of the leaf selected. The first or lower leaves are those which produce milder tobacco. Curing must be done in the shade as the California sunshine is altogether too intense and one gets only a little worthless product as a result.

Franquettes.

Please give information as to whether Franquettes will grow in Southern California. How do they stand blight and at what age do they bear and are they good producers?—J. B. T., Santa Paula.

The Franquette has done well in San Jose and in many parts of the San Joaquin and Sacramento Valleys. In Southern California the few trees which have been planted have, so far as we can learn, been dug up. They grow very thriftily but do not bear

Get out of the rut

Give your buildings the benefit of progress—same as you give the farm itself. Cover every building on the farm with Genasco Ready Roofing—the economical roofing that protects and lasts.

Genasco Ready Roofing

is made of Trinidad Lake asphalt—Nature's everlasting waterproofer. It prevents cracks, breaks, and leaks, and does away with damage and repairs. Easily applied without experienced help.

The Kant-leak Kleet does away entirely with cement and large-headed nails. Keeps seams absolutely watertight. Saves time in laying. Makes a beautiful finish. Ask for Genasco rolls with the Kleet packed in them.

Ask your dealer for Genasco. Mineral or smooth surface. Be sure you see the hemisphere trade mark. A written guarantee, if you want it. Gold medal (highest award) Seattle, 1909. Write for samples and the Good Roof Guide Book.
